## Symbols and Abbreviations

The following symbols and abbreviations, and others approved for the Système International d'Unités (SI), are used without definition in the following reports by the Divisions of Sport Fish and of Commercial Fisheries: Fishery Manuscripts, Fishery Data Series Reports, Fishery Management Reports, and Special Publications. All others, including deviations from definitions listed below, are noted in the text at first mention, as well as in the titles or footnotes of tables, and in figure or figure captions.

| Weights and measures (metric) |  | General |  | Mathematics, statistics |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| centimeter | cm | Alaska Administrative |  | all standard mathematical |  |

December 2017

The Fishery Management Reports series was established in 1989 by the Division of Sport Fish for the publication of an overview of management activities and goals in a specific geographic area, and became a joint divisional series in 2004 with the Division of Commercial Fisheries. Fishery Management Reports are intended for fishery and other technical professionals, as well as lay persons. Fishery Management Reports are available through the Alaska State Library and on the Internet: http://www.adfg.alaska.gov/sf/publications/. This publication has undergone regional peer review.

#### Abstract

This report is a summary of the 2016 season and historical data concerning management of the commercial salmon fisheries of the Northwestern and Northern districts of the North Alaska Peninsula in the Alaska Peninsula Management Area (Area M). Most commercial salmon fishing effort on the North Alaska Peninsula targeted sockeye salmon Oncorhynchus nerka. The 2016 commercial salmon harvest on the North Alaska Peninsula was 1,891 Chinook O. tshawytscha, 3,502,785 sockeye, 73,038 coho O. kisutch, 12,274 pink O. gorbuscha, and 88,894 chum O. keta salmon. The North Peninsula Chinook salmon harvest was well below the 10 year average of 3,075 fish. The sockeye salmon harvest in the Northern District of $3,463,187$ fish was well above the 2006-2015 average harvest of 1,911,875 fish. Of the Northern District harvest, $90 \%$ (3,114,527 fish) were harvested in the sections between Port Moller and Outer Port Heiden. The North Alaska Peninsula chum salmon harvest of 88,894 fish was well below the 10-year average of 188,342 chum salmon, with about $79 \%$ ( 69,903 fish) of the harvest occurring in the Northwestern District, specifically in the Izembek-Moffet Bay Section. Nearly all Northern District chum salmon harvest was incidental as the result of targeted sockeye salmon fisheries.

The estimated total sockeye salmon escapement for North Alaska Peninsula streams was 1,611,310 fish, above the 2006-2015 average of $1,016,378$ fish. Approximately $63 \%$ of the sockeye salmon escapement occurred in the Northern District's 4 systems in which sockeye salmon escapements are enumerated with weirs (Nelson, Bear, Sandy, and Ilnik rivers).

Key words: North Alaska Peninsula, Area M, Northern District, Northwestern District, commercial fisheries, annual management report, AMR, salmon harvest, salmon escapement, SEG, BEG, Chinook salmon, Oncorhynchus tshawytscha, sockeye salmon, Oncorhynchus nerka, coho salmon, Oncorhynchus kisutch, pink salmon, Oncorhynchus gorbuscha, chum salmon, Oncorhynchus keta

## INTRODUCTION

The purpose of this report is to document catch and escapement data, and to provide commercial salmon fishermen, buyers, and interested parties a context with which to compare the 2016 North Alaska Peninsula commercial salmon catch and escapement with historical information. The salmon harvest estimates reported in this document were summarized from the fish ticket database on December 5, 2016. Unless otherwise noted, catch reporting in this report does not include personal use, subsistence, or test fish catches. Data published in this report supersede any data previously published.

## GEOGRAPHY

## North Alaska Peninsula

The North Alaska Peninsula portion of the Alaska Peninsula Management Area (Area M) includes those waters of the Alaska Peninsula from Cape Sarichef to Cape Menshikof and consists of 2 districts: the Northwestern District, which includes all waters between Cape Sarichef and Moffet Point, and the Northern District, which includes all waters between Moffet Point and Cape Menshikof (Figure 1). The Nelson Lagoon to Outer Port Heiden region, which encompasses most of the Northern District, is the primary sockeye salmon Oncorhynchus nerka harvest area on the North Alaska Peninsula and includes the Nelson Lagoon, Bear River, Three Hills, Ilnik, and Outer Port Heiden sections (Figure 2). In addition to these sections, smaller directed commercial salmon fisheries occur in other areas of the North Alaska Peninsula.

## Alaska Peninsula and Bristol Bay Salmon Overlap Area

The Alaska Peninsula Area (Area M) and Bristol Bay Area (Area T) overlap area consists of the Cinder River Section, Inner Port Heiden Section, and Ilnik Lagoon (Figure 3; 5 AAC 39.120(d)). The overlap area was created shortly after statehood to allow Area T permit holders the opportunity
to fish within their traditional harvest locations of Area M. Historically, when not participating in the Bristol Bay sockeye salmon fisheries, Port Heiden Area T permit holders fished for Chinook O. tshawytscha and coho O. kisutch salmon in the Inner Port Heiden Section, and Area T permit holders from Pilot Point fished inside the Cinder River Section for Chinook and coho salmon.

Since 1985, most of the effort in the Cinder River Section has been from Area T permit holders. Prior to 2013, Area T permit holders were allowed to fish during the open season in the Inner Port Heiden and Cinder River sections except during the month of July. In 2013, the Alaska Board of Fisheries (BOF) allowed Area T permit holders to fish in the Inner Port Heiden Section and the inner portion of the Cinder River Section during all months of the commercial fishing season. Area T permit holders are also allowed to fish in Ilnik Lagoon during August and September. In 1986, Area T fishermen started fishing in the Ilnik and Outer Port Heiden sections. In 1990, the BOF excluded Area T permit holders from the Ilnik Section (except inside Ilnik Lagoon during August and September) and closed the Outer Port Heiden Section in August and September to all commercial salmon fishing by both Area M and Area T permit holders because of concern over potential interception of coho salmon bound for Inner Port Heiden (Meshik River). Over the last decade, commercial fishing effort in the overlap area has been minimal for both Area M and Area T permit holders.

## GEAR

Purse seine, hand purse seine, drift gillnet, and set gillnet are legal gear types in the Northwestern District (5 AAC 09.330(b)). In the Northern District, commercial salmon fishing is permitted with purse seine, drift gillnet, and set gillnet gear; however, within-section gear restrictions exist (5 AAC 09.330(a)). For example, the Nelson Lagoon Section is open to drift and set gillnet gear only. In the Northern District drift gillnet is by far the most widely used gear. In the Northwestern District, use of purse seine gear equals or exceeds drift gillnet gear in some years.

## Regulatory Season

The commercial salmon season opens in most of the Northwestern District on June 1 and in most of the Northern District on May 1 (5 AAC 09.310). The Three Hills Section may open to commercial salmon fishing on June 25. In the Ilnik Section fishing is allowed outside of the Ilnik Lagoon beginning June 20 if sockeye salmon escapement meets or exceeds interim escapement objectives. A portion of the Outer Port Heiden Section may open to commercial salmon fishing beginning on June 20 if sockeye salmon escapement in the Meshik River is sufficient. Management action may also be taken in the Ilnik and Outer Port Heiden sections for conservation of Ugashik River sockeye salmon if that portion of the Egegik District specified in 5 AAC 06.359(c) is closed for the conservation of Ugashik River sockeye salmon in the Bristol Bay Management Area.

## InseAson MANAGEMENT

While the earliest opening dates are established by regulation and modified by emergency orders, actual fishing time in North Alaska Peninsula fisheries is based on in season evaluation of local stock abundance and escapement objectives. Sockeye salmon are the primary species targeted for harvest, and the Nelson and Bear rivers are the largest sockeye salmon producing systems. Between June 1 and September 15, within the Nelson Lagoon to Port Heiden region, management emphasis is on 5 sockeye salmon systems: the Nelson, Bear, Sandy, Ilnik, and Meshik rivers (Murphy and Johnson 2016). The Alaska Department of Fish and Game (ADF\&G) operates weir camps on the Nelson, Bear, Sandy, and Ilnik rivers that provide daily escapement counts used to
manage commercial fisheries. Aerial surveys from a fixed wing aircraft are used to enumerate salmon in other systems that do not have weirs.

At the February 2016 BOF meeting, Northern District regulations existing for the conservation of the Bear and Nelson rivers sockeye salmon stocks, as well as the conservation of Bristol Bay sockeye salmon, were modified. ADF\&G manages the commercial fisheries in the Northern District based on the inseason evaluation of local stock abundance and escapement objectives. From June 20 through July 31, rolling closures are in effect in the Bear, Three Hills, and Ilnik sections to allow passage of sockeye salmon from the northeast to the southwest of the Northern District. For management purposes, the 3 sections are separated into 5 areas: South Bear, North Bear, Three Hills, SW Ilnik, and NE Ilnik (Figure 4). Starting in 2016, only 4 of the 5 areas will undergo rolling closures; the portion of the Ilnik Section northeast of Unangashak Bluffs (NE Ilnik) is now excluded from rolling closures (5 AAC 09.369 (n)). The waters in the northeasternmost of the 4 areas, between the 3 nmi seaward boundary line described in 5 AAC 09.301 and a line that is 1.5 nmi shoreward of the 3 nmi seaward boundary, are closed for one 24hour period during a 7 -day period. After a 24 -hour period, the rolling closure will move on to the next area to the southwest, allowing fishing in the waters only out to the 1.5 nmi line described in this subsection for the first 24 hours of an open fishing period. The rolling closure continues down the coast until all 4 areas have had one 24 -hour period of closure. In addition, rolling closures will no longer be in regulation after December of 2018.

Subsequent to the February 2016 BOF meeting, the Outer Port Heiden Section commercial fishing area extends out to the 3 nmi baseline (5 AAC 09.350 (3)(A)).

## EsCAPEMENT GOALS

Weir counts and aerial surveys are used to estimate escapement. ${ }^{1}$ For rivers and river systems with established escapement goals, there are 2 types of goals used to characterize the run. A biological escapement goal (BEG) is used when the following conditions are met: 1 ) a sufficient time series of escapement and total return estimates are available, 2 ) contrast in the escapement data is sufficiently large, and 3) the estimates were sufficiently accurate and precise (Schaberg et al. 2015). Using these criteria, systems assigned a BEG are managed for escapements providing the greatest potential for maximum sustained yield. A sustainable escapement goal (SEG) is used when total return estimates are not available because harvest or age was not consistently measured (Schaberg et al. 2015). Methods used to develop SEGs include the percentile approach and risk analyses models (Schaberg et al. 2015). As defined by the Sustainable Salmon Fisheries Policy (SSFP; 5 AAC 39.222), an SEG is a level of escapement indicated by an index or escapement estimate that is known to provide for sustained yield over a 5 - to 10 -year period and is used in situations where a BEG cannot be estimated or managed for due to the absence of a stock specific catch estimate.

The commercial salmon fisheries on the North Alaska Peninsula are managed using escapement goals developed using the aforementioned criteria and methods. The inseason escapement at each system with an established goal determines how the fisheries are managed.

[^0]In 2015, ADF\&G performed a review of salmon escapements on the North Peninsula. The escapement goal review determined that it was appropriate to recommend changes to the escapement goal ranges for the Meshik and Cinder river systems, recommending SEGs of 48,00086,000 and 36,000-94,000 respectively (Schaberg et al 2015).

## Run Timing

The timing of sockeye salmon returning to North Alaska Peninsula streams varies by system and stock, but the majority of the sockeye salmon runs occur from early June to late July. Local sockeye salmon stocks are managed in the Nelson Lagoon to the Port Heiden region from June through September. The Nelson River sockeye salmon run begins in early June, peaks in early July, and is over by mid-August (Murphy and Hartill 2009). Bear River supports 2 distinct sockeye salmon runs: an early run that begins in early June, peaks in early July, and ends in late July; and a late run that starts in late July, peaks in mid-August, and ends in September (Ramstad 1998). The Sandy, Ilnik, Meshik, and Cinder rivers run timing closely parallels the Bear River early run, beginning in early June and ending in late July (Murphy and Hartill 2009).

## HARVEST BY SPECIES

## CHINOOK SALMON

The 2016 North Alaska Peninsula commercial Chinook salmon harvest of 1,891 fish was well below the 2006-2015 average of 3,075 fish (Table 1). Historically, the vast majority of Chinook salmon harvest occurred in the Northern District incidental to sockeye salmon fisheries, although periodically there were directed fisheries. In 2016, the Chinook salmon harvest of 1,188 fish in the Nelson Lagoon Section was above the 10-year average of 907 fish (Tables 2 and 3). The Bear River Section harvest of 101 was below the 10-year average of 585 fish (Table 3). The Three Hills and Ilnik sections combined harvest of 485 Chinook salmon was well below the 10-year average of 1,038 fish (Table 3). The Outer Port Heiden Section, which reopened in 2007 for the first time since 1989, had a harvest of 75 Chinook salmon (Table 2). There was no commercial fishing effort in the Inner Port Heiden Section in 2016 (Table 3).

## SOCKEYE SALMON

The 2016 North Alaska Peninsula sockeye salmon harvest of 3,502,785 fish (Table 1) was above the 2006-2015 average harvest of 1,954,463 fish, as well as the 1996-2015 average harvest of 1,901,843 fish (Figure 5). The 2016 harvest exceeded the preseason projected harvest of 2,200,000 sockeye salmon (Table 1; Brenner and Munro 2016). The 2016 peak weekly harvest for sockeye salmon on the North Alaska Peninsula occurred from July 5 to July 11, when 148 permit holders caught 840,665 sockeye salmon (Table 2).
Most of the harvest occurred in the Northern District in the Nelson Lagoon, Bear River, Three Hills, Ilnik, and Outer Port Heiden sections (Figures 1 and 2). The Nelson Lagoon sockeye salmon harvest in 2016 was 301,786 fish, which was above the 2006-2015 average harvest of 201,674 fish (Table 4). The Nelson Lagoon harvest made up approximately 9\% of the total North Alaska Peninsula sockeye salmon harvest. The combined Port Moller Bight, Bear River, Three Hills, and Ilnik sections total harvest was 2,482,055 sockeye salmon (Table 5), and the Outer Port Heiden Section had a harvest of 632,474 fish (Table 4). The combined Port Moller Bight, Bear River, Three Hills, Ilnik, and Outer Port Heiden sections accounted for approximately 89\% (3,114,527 fish, Table 2) of the North Alaska Peninsula sockeye salmon harvest. Of that harvest, the Ilnik

Section had 70\% (2,168,297 fish), the Outer Port Heiden Section accounted for about 20\% (632,474 fish), the Bear River Section had approximately $8 \%$ ( 255,837 fish), and the Three Hills Section had 2\% (57,919 fish; Table 4). The proportion of harvest in the Bear River Section in 2016 was below the most recent 10-year average (23\%). The proportion of commercial catch in the Three Hills Section was well below the most recent 10 -year average (7\%). The proportion of commercial catch in the Ilnik Section was well above the most recent 10-year average of $41 \%$ (Figure 6). The percentage of harvest caught in the Outer Port Heiden Section was below the recent historical average (2007-2015) of $28 \%$; however, it cannot be compared to a 10 -year average because commercial salmon fishing was only recently permitted in this section beginning in 2007.

## COHO SALMON

The 2016 North Alaska Peninsula coho salmon harvest of 73,038 fish was above the 2006-2015 average harvest of 66,261 fish (Table 1). Approximately $47 \%$ ( 34,353 fish, Table 6) of the coho salmon harvest came from the Ilnik Section, and $37 \%$ of the harvest ( 27,312 fish) came from the Nelson Lagoon Section. The remaining Northern District sections had approximately 12\% of the coho salmon harvest ( 8,994 fish). The Northwestern District accounted for $3 \%$ of the harvest (2,379 fish, Table 6). The Nelson Lagoon Section typically has the largest coho salmon harvest, followed by either the Bear River or Ilnik sections; however, this year it was surpassed by the Ilnik Section in harvest.

## PINK SALMON

The 2016 North Alaska Peninsula pink salmon harvest of 12,274 fish was well below the 20062015 even-year average harvest of 21,157 fish (Table 1). Pink salmon harvested in the Northern District are caught incidental to fisheries for other salmon species. The majority of the pink salmon harvest traditionally occurs in the Northwestern District; however, in 2016 the Northern District accounted for the majority of the commercial harvest, with the Northwestern District accounting for $15 \%$ ( 1,812 fish) of the pink salmon harvest (Table 7). All of the pink salmon harvested in the Northwestern District during 2016 were incidental to chum and sockeye salmon harvest in the Izembek-Moffet Bay Section.

## Chum Salmon

The 2016 North Alaska Peninsula chum salmon harvest of 88,894 fish was well below the 20062015 average harvest of 188,342 fish (Table 1). In the Northern District, the harvest of 18,991 fish was below the 2006-2015 average of 69,685 fish (Table 8). The majority of the chum salmon harvest in the Northern District occurred in the Nelson Lagoon Section (6,967 fish; Tables 2 and 8) in late July. The Northwestern District chum salmon harvest of 69,903 fish was below the 10year average of 118,657 fish, all of which were harvested in the Izembek-Moffet Bay Section (Table 9). The Izembek-Moffet Bay Section harvest (69,903 chum salmon) was below the recent 10 -year average of 96,485 fish (Table 9).

## ESCAPEMENT BY SPECIES

## CHINOOK SALMON

The 2016 North Alaska Peninsula estimated total Chinook salmon escapement of 17,464 fish was above the 2006-2015 average of 15,443 fish (Table 1). During the 2016 season, 4,618 Chinook salmon passed the Nelson River weir (Table 10 and Appendix A1), exceeding the BEG range of

2,400-4,400 fish (Schaberg et al. 2015). Nelson River is the only river on the North Alaska Peninsula with a Chinook salmon escapement goal. The combined King Salmon, Bear, and Sandy rivers (Bear River Section) estimated Chinook salmon escapement was 4,541 fish, greater than the 2006-2015 average of 1,491 fish (Appendix A1 and Table 3). The Bear River and Sandy River weir counts (Tables 11 and 12) do not accurately reflect the total escapement of Chinook salmon because most of the fish spawn below the weir sites or in other downstream tributaries. There were 5 Chinook salmon that passed the Ilnik River weir in 2016 (Table 13). The Chinook salmon escapement of 1,275 fish into the Inner Port Heiden Section (the Meshik River and its tributaries) was well below the 10-year average of 4,258 fish (Table 3; Appendix A1). In the Cinder River Section, 5,450 Chinook salmon were documented, which was above the 2006-2015 average of 3,902 fish (Table 3; Appendix A1).

## SOCKEYE SALMON

The 2016 North Alaska Peninsula estimated total sockeye salmon escapement of 1,611,310 fish, which included weir and aerial survey counts, was above the 2006-2015 average estimated escapement of $1,016,378$ fish (Table 1; Figure 7). The combined North Alaska Peninsula escapement goal range is $583,400-1,095,800$ sockeye salmon for systems with established goals (Schaberg et al. 2015). The systems with SEGs are Christianson Lagoon (25,000-50,000 fish), Swanson Lagoon (6,000-16,000 fish), North Creek (4,400-8,800 fish), Bear River (early run 176,000-293,000 fish, late run 117,000-195,00 fish, or combined 293,000-488,000 fish), Sandy River (34,000-74,000 fish), Ilnik River (40,000-60,000 fish), Meshik River (48,000-86,000 fish), and Cinder River ( $36,000-94,000$ fish; Schaberg et al. 2015). Nelson River is the only system on the North Alaska Peninsula with a BEG (97,000-219,000 fish; Schaberg et al. 2015). The systems most often considered in management decisions and the historical escapements and goal ranges are detailed in Table 14. In 2016, seven systems exceeded their escapement goals: Christianson Lagoon (111,700 fish), North Creek (21,000 fish), Ilnik River (124,000 fish, including Ocean River), Cinder River (205,700 fish, including tributaries), Nelson River (300,000 fish), Sandy River (170,000 fish), and Meshik River (116,800 fish, including tributaries; Appendix A1 and Table 14). In addition, Swanson Lagoon, located in the Northwestern District, did not meet its escapement goal, with only 3,000 fish observed through aerial surveys (Appendix A1).

## Nelson River

In 2016, 363,000 sockeye salmon escaped into streams in the Nelson Lagoon Section (Table 4), of which 300,000 fish returned to Nelson River, along with 2,000 returning to David's River and 61,000 returning to Caribou River (Appendix A1). The Nelson River weir sockeye salmon escapement of 300,000 fish exceeded the escapement goal range of $97,000-219,000$ sockeye salmon and was above the 10-year average of 174,890 fish (Tables 14 and 15; Schaberg et al. 2015). The peak daily escapement ( 18,889 fish) at the Nelson River weir occurred on July 6 (Table 15).

Nelson River is the only North Alaska Peninsula river system that has a female sockeye salmon escapement objective. In some years, high numbers of female sockeye salmon have been harvested, reducing the quality of escapement. To account for this, the proportion of female sockeye salmon passing the weir is determined through periodic sampling. That proportion is then extrapolated to account for the entire day's escapement. When the weir was removed on July 27, it was estimated that about 117,181 female sockeye salmon had passed the weir (Table 15),
exceeding the management escapement objective of 50,000-110,000 female fish (Murphy and Johnson 2016).

## Bear River

Bear River has early and late sockeye salmon escapement goals because the river is recognized as having 2 distinct, temporally separated runs. In 2016, the Bear River early-run (before August 1) was comparable to the upper end of the escapement goal range of 176,000-293,000 fish, with an escapement of 293,280 sockeye salmon, while the late-run (after July 31) was within the escapement goal range of $117,000-195,000$ fish, with an escapement of 139,720 sockeye salmon (Tables 16 and 17; Schaberg et al. 2015). The largest daily escapement at the weir in 2016 occurred on June 28 when 21,857 sockeye salmon were counted (Table 17).

## Sandy River

The total 2016 Sandy River sockeye salmon escapement of 170,000 fish was well above the escapement goal range of 34,000-74,000 fish, and exceeded 2006-2015 average escapement of 47,950 fish (Tables 14 and 18; Schaberg et al. 2015). The largest daily escapement at the Sandy River weir occurred on July 8, when 13,232 sockeye salmon were counted (Table 18).

## Ilnik River

In 2016, the Ocean River, normally a tributary of the Ilnik River, altered course and drained directly into the Bering Sea. When the Ocean River drains into the Bering Sea, fish observed through aerial surveys at Ocean River are added to escapement totals for Ilnik River. In 2016 a total of 92,000 sockeye salmon were observed in the Ilnik River, and 32,000 sockeye salmon were observed in the Ocean River, for a total of 124,000 sockeye salmon (Table 19, Appendices A1 and A2). The total Ilnik River escapement exceeded the escapement goal of 40,000-60,000 fish, and was well above the 2006-2015 average of 59,030 fish (Table 14; Schaberg et al. 2015).

## Port Heiden

The majority of escapement in Port Heiden is made up of fish spawning in Meshik River. Escapement into Meshik River and its tributaries are determined by aerial surveys. In 2016, 116,800 sockeye salmon were documented in the Meshik River (including Red Bluff Creek) exceeding the escapement goal of 48,000-86,000 fish (Appendix A1; Schaberg et al. 2015). This was well above the 10-year average of 89,616 fish (Table 14).

## COHO SALMON

The Nelson and Ilnik rivers are the only rivers on the North Alaska Peninsula that have a coho salmon lower-bound SEG. At Nelson River, the peak escapement estimate of 45,000 coho salmon (determined by aerial surveys) exceeded the goal of 18,000 fish (Appendix A1; Schaberg et al. 2015). In 2016, the Ocean River, normally a tributary of the Ilnik River system, drained directly into the Bering Sea. When the Ocean River drains into the Bering Sea, fish observed in the Ocean River are added to escapement totals for the Ilnik River. In 2016 a total of 23,000 fish were observed in the Ilnik River, and 5,000 fish were observed in the Ocean River, for a total of 28,000 coho salmon (Appendix A1). The peak escapement estimate of 28,000 coho salmon for the Ilnik River system exceeded the escapement goal of 9,000 fish (Schaberg et al. 2015). Some of the larger estimated escapements occurred in the Meshik River (112,000 fish, including tributaries), Cinder River ( 56,000 fish including tributaries), and Grass Valley in the Herendeen-Moller Bay Section (8,000 fish; Appendix A1). A lack of escapement information for coho salmon in the

Northwestern District is due to poor survey conditions during the early portion of the coho salmon runs and to the departure of management staff from the Alaska Peninsula prior to peak coho salmon runs.

Approximately 291,775 coho salmon were documented by aerial surveys in 31 North Alaska Peninsula streams during 2016 (Appendix A1 and A2). It should be noted that due to budget constraints most completed surveys occurred prior to the peak of the coho salmon run.

## Pink SALMON

Even-numbered year pink salmon escapements are typically larger than odd-numbered year escapements on the Alaska Peninsula. The 2016, the North Alaska Peninsula estimated total pink salmon escapement of 97,496 fish was comparable the 2006-2015 even-year average of 91,860 fish (Table 1; Appendix A1). The majority of the pink salmon escapement occurred in the Northern District ( 63,246 fish, Appendix A1), accounting for $65 \%$ of the total escapement for the North Peninsula.

## CHUM SALMON

The North Alaska Peninsula has 2 aggregated chum salmon escapement goals: one for the Northern District, and one for the Northwestern District. In 2016, the Northern District chum salmon escapement of 277,674 fish exceeded the escapement goal of 119,600-239,200 fish (Table 8; Appendix A1; Schaberg et al. 2015). Historically the Herendeen-Moller Bay Section has the largest chum salmon run in the Northern District. In 2016, Herendeen and Moller bays accounted for about 35\% of the total Northern District chum salmon escapement (98,300 fish; Table 8). The remaining chum salmon escapement in the Northern District is shown in Table 8. The Northwestern District chum salmon escapement of 113,250 fish met the goal of 100,000-215,000 fish, and was below the previous 10-year average of 152,775 fish (Table 9; Schaberg et al. 2015). The total North Alaska Peninsula estimated chum salmon escapement of 390,924 fish was above the 2006-2015 average of 343,104 fish (Table 1).

## COMMERCIAL SALMON FISHERY SUMMARY

The majority of the North Alaska Peninsula commercial fishing effort targeting sockeye salmon occurred in the Nelson Lagoon, Bear River, Three Hills, Ilnik, and Outer Port Heiden sections in the Northern District. The total Northern Peninsula sockeye salmon harvest of 3,502,785 fish was above the 2006-2015 average of 1,954,463 fish (Table 1). A complete listing of all commercial salmon harvested by day on the North Peninsula can be found in Table 20.

## NORTHWESTERN DISTRICT

The Northwestern District the commercial salmon fishing season starts June 1 and extends through September 30, except that in the in the Dublin Bay Section salmon may only be taken from July 10 through September 20 (5 AAC 09.310 (b)). During the 2016 Northwestern District commercial salmon fishery, a total of 39,598 sockeye, 2,379 coho, 1,812 pink, and 69,903 chum salmon were harvested (Table 21). The Northwestern District has few large sockeye salmon producing systems and receives less commercial fishing effort than the Northern District. In 2016, all commercial salmon fishing effort occurred in the Izembek-Moffet Bay Section of the Northwestern District targeting chum salmon, and 21 permit holders participated in the fishery (Table 2).

The 2016 sockeye salmon harvest in the Northwestern District of 39,598 fish was below the 20062015 average harvest of 42,584 fish, although this catch was above the Izembek-Moffet Bay 2006-2015 average of 25,424 fish (Table 22). The majority of sockeye salmon harvested in the Izembek-Moffet Bay Section were harvested in the Moffet Bay area (32,501 fish; Table 21). The pink salmon harvest of 1,812 fish was far below the 2006-2015 even-year average of 16,493 fish (Table 7). The Northwestern District chum salmon harvest of 69,903 fish in 2016 was below the 10 -year average harvest of 118,657 fish (Table 9).

## NORTHERN DISTRICT

## Black Hills Section

The Black Hills Section may open to commercial salmon fishing starting May 1 (5 AAC 09.310 (a)(10)). In 2016, 39 permit holders harvested 46,487 sockeye salmon and 2,484 chum salmon in the Black Hills Section (Table 2). Regularly scheduled weekly fishing periods occurred throughout the fishing season, and starting in August, weekly 24-hour extensions to commercial fishing periods occurred. Fishing time in the Izembek-Moffet Bay Section and the Black Hills Section is usually concurrent; however, the 24-hour extensions did not apply to the Izembek-Moffet Bay area. The close proximity of the Black Hills Section to the Izembek-Moffet Bay Section means that chum salmon headed for Izembek Moffet Bay may potentially be incidentally intercepted by Black Hills fishermen targeting sockeye salmon. As a result, that portion of the Black Hills Section in close proximity to the Izembek-Moffet Bay was closed to commercial salmon fishing during the weekly 24-hour extensions occurring in the Black Hills Section. As a result, proportionally very few chum salmon were caught in 2016 in comparison to the sockeye salmon harvest. The sockeye salmon harvest was above the 10 -year average of 23,331 fish (Table 4). The chum salmon harvest was well below the 10-year average of 17,092 fish (Table 8). The peak weekly harvest for sockeye and chum salmon occurred from August 2 to August 8, and a total of 32,892 sockeye salmon and 1,357 chum salmon were harvested during this time period (Table 2). North Creek is the only river in the Black Hills Section with a sockeye salmon escapement goal. The 2016 North Creek salmon escapement estimate of 21,000 sockeye salmon (determined by aerial surveys) exceeded the escapement goal of 4,400-8,800 fish (Appendix A1; Schaberg et al. 2015).

## Nelson Lagoon Section

The Nelson Lagoon Section may open to commercial salmon fishing on May 1 (5 AAC 09.310 (a)(8)). Fishing times are based on the evaluation of the Nelson River sockeye salmon stocks from mid-June to mid-August (5 AAC 09.369 (e)(2)). During the 2016 commercial salmon fishing season, the Nelson Lagoon Section was open during regularly scheduled weekly fishing periods throughout the season, with fishing time extensions occurring weekly (Tables 23 and 24). The total Nelson River system run, consisting of the Nelson Lagoon Section harvest and escapements of all Nelson River tributaries, was 664,786 sockeye salmon (Table 4). A total of 31 permit holders harvested 301,786 sockeye salmon (Table 24), which was well above the 2006-2015 average harvest of 201,674 fish (Table 4; Figure 8). The first day of salmon harvest in the Nelson Lagoon Section occurred on June 6 and the last day was September 3. The peak daily sockeye salmon catch was on July 18, when 26 permit holders harvested 11,610 fish (Table 24). The largest weekly harvest in Nelson Lagoon occurred between July 5 and July 11, when 67,181 sockeye salmon were harvested (Table 2; Figure 9).

After August 15, the Nelson Lagoon Section was managed based on coho salmon run strength. The 2016 Nelson Lagoon coho salmon harvest of 27,312 fish was well below the 2006-2015 average of 41,744 fish and represented about $39 \%$ of the total Northern District coho salmon harvest (Tables 6 and 21). In recent years, increased processor interest and higher prices for coho salmon have resulted in increased harvest effort.

## Bear River and Three Hills Sections

By regulation, the Bear River Section opens to commercial salmon fishing on May 1, while the Three Hills Section opens June 25 (5 AAC 09.310 (a)(4)(5)). Fishing times in the Bear River and Three Hills sections are based on the evaluation of the Bear and Sandy river sockeye salmon stocks through June and July (Murphy and Johnson 2016).

Throughout 2016, the Bear River early run was late in developing, but ultimately was strong compared to previous years. Interim escapement objectives were met throughout the season. The Sandy River run was abnormally strong and interim escapement objectives were exceeded throughout the season. Commercial fishing first occurred in the Bear River Section for 1 weekly fishing period during the first week of June. Between June 8 and June 30, commercial fishing was closed in the Bear River Section in order to meet interim escapement objectives. Commercial fishing occurred from July 1 through July 29 in both the Bear River Section and Three Hills Section with occasional short closures. The Bear River and Three Hills sections were both closed July 29 in order to allow the late Bear River run to develop (Table 25). The late Bear River sockeye salmon run begins August 1. On August 5, test fisheries were conducted at the mouth of Bear River to assess if there was any marine build-up of sockeye salmon and the strength of the Bear River laterun sockeye salmon (Appendix B1 and B2). The test fishery results did not indicate that there was a harvestable surplus (Table 26) and the fishery remained closed until August 9. The Bear River and Three Hills sections reopened to commercial salmon fishing on August 9 with a large buffer zone around the mouth of Bear River to allow milling fish an opportunity to enter the river while providing some commercial salmon harvest opportunity (Table 23). When it was assured that the final escapement objective of $87,000-165,000$ sockeye salmon by August 25 would be met, the buffer area was reopened to commercial salmon fishing on August 18 (Table 23).

In 2016, the Ocean River played a role in the management of the Three Hills Section. The Ocean River changes courses often on an annual basis. In 2016, the Ocean River, normally a tributary of the Ilnik River, changed course significantly and emptied into the Bering Sea close to the dividing line between the Three Hills and Ilnik sections located at $159^{\circ} 49.45^{\prime}$ west longitude. The commercial salmon fishing season was closed around the mouth of the Ocean River in order to protect escaping fish (Table 23).
Harvest in the Bear River Section occurred from June 6 to September 1. A total of 94 permit holders harvested 255,837 sockeye salmon, which was below the 2006-2015 average harvest of 394,708 fish (Tables 4 and 25). The largest weekly harvest in the Bear River Section of 67,314 sockeye salmon occurred between July 5 and July 11 (Table 2). The largest daily harvest of 27,538 sockeye salmon occurred on July 2 (Table 25). The total late-run harvest of 193,595 sockeye salmon was below the most recent 10-year average of 317,647 fish, whereas the late-run escapement ( 139,720 fish) was well below the most recent 10 -year average of 174,362 fish (Table 16).

Harvest in the Three Hills Section occurred from July 1 through September 2. A total of 57,919 sockeye salmon were harvested by 61 permit holders (Tables 4 and 27). The 2016 sockeye salmon harvest was below the most recent 10-year average of 129,201 fish (Table 4).

## Ilnik Section

The Ilnik Section may open to commercial salmon fishing on June 20, depending on escapement levels in the Ilnik and Meshik rivers (5 AAC 09.369(j)(1)(A)). Management of the Ilnik Section northeast of Unangashak Bluffs (NE Ilnik) is based on the Ilnik River weir escapement and Meshik River sockeye salmon escapement (as determined by aerial surveys). In that portion of the Ilnik Section southwest of Unangashak Bluffs (SW Ilnik), management actions are based on Ilnik River weir escapement levels from June 20 to July 20. Between July 21 and August 15, the Ilnik Section is based on the abundance of Bear River sockeye salmon stocks (Murphy and Johnson 2016).

A total of 120 permit holders harvested 2,168,297 sockeye salmon in the Ilnik Section (Table 28). The first harvest in the Ilnik Section occurred on June 25 and the last delivery occurred on September 3 (Table 28). About 79\% of the harvest (1,715,107 sockeye salmon) occurred between in NE Ilnik, and 21\% (453,190 sockeye salmon) was harvested in SW Ilnik (Table 21; Figure 4). The 2016 peak daily catch was on June 25, when 158,715 sockeye salmon were harvested (Table 28). The largest weekly harvest occurred between July 5 and July 11, when 599,305 sockeye salmon were harvested (Table 2).

After August 15, by regulation, the Ilnik Section is managed on the basis of coho salmon runs into Ilnik Lagoon (Murphy and Johnson 2016). A total of 34,353 coho salmon were harvested in the Ilnik section, which was well above the 2006-2015 average of 8,612 fish (Table 6).

No commercial salmon fishing effort occurred inside Ilnik Lagoon in 2016 even though fishing time was permitted (Table 21).

## Outer Port Heiden Section

This was the tenth year a directed sockeye salmon fishery occurred in the Outer Port Heiden Section since a portion of the section reopened in 2007. By regulation, the Outer Port Heiden Section may open to commercial salmon fishing from June 20 through July 31. Fishing time in the Outer Port Heiden Section is based on Meshik River sockeye salmon abundance, unless management actions are taken for the conservation of Ugashik River sockeye salmon in the Egegik District of Area T (Murphy and Johnson 2016).

The weekly fishing period in the Outer Port Heiden Section allows 2.5 days of fishing time per week. In 2016, commercial salmon fishing opened in the Outer Port Heiden section on June 25 for the first 2.5-day fishing period. This schedule was followed through July 27 when the area closed for the season (Table 23). A total of 84 permit holders harvested 632,474 sockeye salmon from the Outer Port Heiden Section (Table 29). The peak daily catch was on July 2 when 40 permit holders harvested 117,529 sockeye salmon (Table 29). The largest weekly harvest of 203,171 sockeye salmon occurred between July 12 and July 18 (Table 2; Figure 10). The number of permit holders fishing in the Outer Port Heiden Section in 2016 was comparable to the previous 5 years (Figure 11), while the sockeye salmon harvest was above the 2007-2016 average of 493,789 fish (Table 4).

## Inner Port Heiden and Cinder River Sections

The Inner Port Heiden and Cinder River sections are both part of the Area M/Area T overlap. There was no commercial fishing effort in the Inner Port Heiden Section in 2016. Confidentiality
requirements prohibit the release of information regarding the Cinder River Section; however, the catch was negligible. Commercial fishing effort has not significantly or consistently occurred in either the Inner Port Heiden or Cinder River sections since the late 1990s. Table 30 provides historical harvest data for the Area M/Area T overlap area.

## EMERGENCY ORDERS

In 2016, there were a total of 42 emergency orders issued concerning North Alaska Peninsula salmon fisheries (Table 23). The first emergency order for the North Alaska Peninsula was issued on June 12 and the last on September 2. Emergency orders for North Alaska Peninsula fisheries were issued from the regional ADF\&G offices in Port Moller for the Northern District, and in Sand Point for the Northwestern District in 2016.

Note: Catch numbers do not include test fish harvest or fish retained for personal use. Differences in totals may occur between tables due to confidentiality requirements.
a Escapements are estimated totals.
b These figures are very rough extrapolated estimates.
c Number of fish in thousands.
d No surveys were conducted in the Northern District.
e Averages for pink salmon include only the even-numbered years 2006, 2008, 2010, 2012, and 2014.

Note: Catch numbers do not include test fish harvest or fish retained for personal use.
${ }^{a}$ No commercial salmon harvest effort.
b The Caribou Flats Section: no open season.
c Confidentiality requirements prohibit reporting the harvest. Totals include numbers omitted for confidentiality purposes.
d Fishery closed.
e This total differs from the sum of the individual sections because it includes numbers omitted from other areas due to confidentiality requirements.

Note: Catch numbers do not include test fish harvest or fish retained for personal use. Differences in totals may occur between tables due to confidentiality requirements.
a Outer Port Heiden Section catches occurred only between 1986 and 1989. This section was closed between 1990 and 2006.
b Inner Port Heiden escapements include Meshik River, Red and Yellow Bluff creeks, and minimal escapements from Birthday and Charles creeks.
c Escapement includes all sockeye systems, mainly Bear and Sandy Rivers combined with post weir estimates.
d Nelson Lagoon escapement includes tributaries David's and Caribou rivers.
e Escapements are indexed totals except for Bear, Sandy, Ilnik, and Nelson rivers, where weir and tower counts are used.
${ }^{f}$ Ilnik Section and Three Hills Section combined.
$\pm \quad g^{g} \quad$ These figures are extrapolated estimates.
h Outer Port Heiden average catch includes 2007-2015, the years the section has been reopened.

Note: Catch numbers do not include test fish harvest or fish retained for personal use. Differences in totals may occur between tables due to confidentiality requirements.
a Statistical area 311-58 was moved from the Bechevin Bay Section to the Izembek-Moffet Bay Section in 2001.
b Catch numbers include a small harvest from the Dublin Bay Section in 1983, 2006, and 2011.
c Escapements are estimated totals.
d Averages include only the even-numbered years 2006, 2008, 2010, 2012, and 2014.

Note: Catch numbers do not include test fish harvest or fish retained for personal use. Differences in totals may occur between tables due to confidentiality requirements.
${ }^{\text {a }}$ Statistical area 311-58 was moved from the Bechevin Bay Section to the Izembek-Moffet Bay Section in 2001.
b Catch numbers include a small harvest from the Dublin Bay Section in 1983, 2006, and 2011.
c Escapements are rounded indexed totals.

-continued-

Table 14.-Page 2 of 2.
a Does not include David or Caribou Rivers.
${ }^{\text {b }}$ Escapement is based on weir counts and post weir escapement estimates. Only those years when weirs were present are included in the table.
c From 2005-2010, 2012-2013, and 2016, the Ocean River did not flow into Ilnik Lagoon. For those years, Ocean River escapements have been added to the Ilnik River weir count. In 2016, the Ocean River escapement was 32,000 fish.
d Escapements are estimates is based on aerial surveys.
e Meshik River escapement includes Red and Yellow Bluff creeks (tributaries).
f Cinder River escapement includes Mud Creek (a tributary).

Table 15.-Sockeye salmon daily and cumulative escapement counts through the Nelson River weir, 2016.

Note: Catch numbers do not include test fish harvest or fish retained for personal use. Differences in totals may occur between tables due to confidentiality requirements.
a Bear River escapement prior to August 1.
b Bear River escapement post July 31, including post-weir estimate.
c Commercial catch from Port Moller Bight to Strogonof Point, post July 31.
d Bear River escapement with post-weir estimate, and Port Moller to Strogonof Point catch, post July 31.

$\bigcirc \quad$ a $\quad$ Numbers for this day are an estimate due to high water events at the weir.
b Weir removed the following day.
c Post-weir escapement estimates were determined using aerial surveys, commercial fishery performance, run timing indicators, effort levels, and weather conditions to provide a reasonable estimate of escapement levels after weir was removed.

|  | Estimated total escapement: |  |  | 124,0 |  |  |  |  |  |  |  |  |

[^13]a Weir removed the following day.
b Post-weir escapement estimates were determined using aerial surveys, commercial fishery performance, run timing indicators, effort levels, and weather conditions to provide a reasonable estimate of escapement levels after weir was removed.
c Aerial surveys were used to observe escapement into the Ocean River.

Note: Catch numbers do not include test fish harvest or fish retained for personal use. Differences in totals may occur between tables due to confidentiality requirements.
a Statistical area 311-58 was moved from the Bechevin Bay Section to the Izembek-Moffet Bay Section in 2001.
b Catch numbers include a small harvest from the Dublin Bay Section in 1983, 2006, and 2011 only.
c Escapements are estimated totals.

Table 23.-Emergency order summary for the North Alaska Peninsula commercial salmon fishery, 2016

| Emergency Order \# | Issued: | Effective: | Action Taken: |

Appendix B2.-Page 2 of 2.

[^0]:    1 The Sustainable Salmon Fisheries Policy (5 AAC 39.222) defines escapement as the annual estimated size of the spawning salmon stock; quality of the escapement may be determined not only by numbers of spawners, but also by factors such as sex ratio, age composition, temporal entry into the system, and spatial distribution within the salmon spawning habitat.

[^11]:    -continued-

[^12]:    a Weir removed the following day.
    b Post-weir escapement estimates were determined using aerial surveys, commercial fishery performance, run timing indicators, effort levels, and weather conditions to provide a reasonable estimate of escapement levels after weir was removed.

[^13]:    Note: Catch numbers do not include test fish harvest or fish retained for personal use. Differences in totals may occur between tables due to confidentiality requirements.
