26. CLIMATE AND METEOROLOGY

26.1 Introduction

The Cook Inlet study area is in a transitional climatic zone with strong maritime influence. Summer temperatures are moderated by the open waters of Iniskin Bay, Iliamna Bay, and Cook Inlet. Winter temperatures are more continental because of sea ice in Iniskin Bay, Iliamna Bay, and Cook Inlet. Weather systems typically travel into the region from the Bering Sea to the west, from along the Aleutian Island chain to the southwest, and from the Gulf of Alaska to the south. Depending on the season, these weather systems consist of cool to cold air that is saturated with moisture, resulting in frequent clouds, rain, and snow. Less frequent wintertime incursions of frigid, stable arctic air masses bring shorter periods of clear, but very cold, conditions to the region. In the summer, incursions of very warm air masses from interior Alaska can cause atmospheric instability that result in cumulus cloud development and occasional thunderstorm activity.

Three meteorological stations were installed in the Cook Inlet study area at three possible port site areas. Installation of the Port Site 1 (also called Pebble Port Station in Annual Reports to ADEC and Appendices to this Environmental Baseline Document) monitoring station began in June 2005 and meteorological monitoring began on August 1, 2005. Installation of the Williamsport monitoring station began in July 2007 and meteorological monitoring began on January 1, 2008. Installation of the North Head monitoring station began in September 2007 and meteorological monitoring began on January 1, 2008.

26.2 Study Objectives

The objective of the meteorology data-collection program is to collect surface meteorological data for the Cook Inlet study area. The meteorological data for the environmental study program are being collected in strict accordance with the same guidance as provided to meet PSD requirements. Additional meteorological data are being collected to support engineering design in general accordance with PSD guidance; however, variations from PSD guidance do exist in the collection of these additional meteorological data.

26.3 Study Area

Meteorological data are being collected at three possible port locations for the Pebble Project: Port Site 1, Williamsport, and North Head. The Port Site 1 meteorological station is located on a small knoll on the west shore of Iniskin Bay near the mouth of the bay (Figure 26-1). The terrain rises very sharply west of the monitoring station. Personnel from the U.S. Environmental Protection Agency (EPA) and the Alaska Department of Environmental Conservation (ADEC) visited and inspected this site and confirmed that meteorological data collected at this location would be representative of the meteorological study area in the Cook Inlet drainages. The Williamsport station is located on the west side of upper Iliamna Bay on

Williams Creek (Figure 26-1). The terrain rises sharply south-southwest and north of this monitoring station. The North Head station is located on the northern side of the entrance of Iliamna Bay on the southern tip of the same peninsula on which the Port Site 1 station is located (Figure 26-1). All three stations were located consistent with the EPA and ADEC requirements set forth in *Meteorological Monitoring Guidance for Regulatory Modeling Applications* (EPA, 2000).

26.4 Previous Studies

A previous meteorological monitoring station with a climatic record that would be representative of the Cook Inlet study area does not exist. The closest meteorological monitoring stations with a climatic record are at Homer and Iliamna. Homer is located on the east side of Cook Inlet approximately 110 kilometers east of Port Site 1, approximately 119 kilometers east of Williamsport, and approximately 114 kilometers east of North Head. Iliamna is located on the north shore of Iliamna Lake approximately 80 kilometers west of Port Site 1, approximately 70 kilometers west of Williamsport, and approximately 71 kilometers west of North Head. Because of these distances and differences in terrain features, the climatic data collected at Homer and Iliamna are not indicative of conditions at the Cook Inlet meteorology study area.

26.5 Scope of Work

The research and field work for this study were begun in 2004. Installation of the Port Site 1 monitoring station began in June 2005. Collection of PSD-quality meteorological data began on August 1, 2005, and is ongoing. Installation of the Williamsport and North Head monitoring stations began in July 2007 and September 2007, respectively. Collection of PSD-quality meteorological data for both stations began on January 1, 2008, and is ongoing. The work has been conducted by Steve Mackey, Eric Brudie, Dominic Shallies, Jared Cockman, and Isaac Bertchi of the Hoefler Consulting Group.

The scope of work for the port area meteorological study is to measure and report the following meteorological parameters:

- Wind speed.
- Wind direction.
- Wind direction standard deviation (sigma-theta).
- Temperature.
- Precipitation.
- Evaporation.

26.6 Methods

This study was conducted according to the approach described in Chapter 2 of the study plan for the environmental baseline studies (a copy of which is provided as Appendix E of this environmental baseline document). The measurement methods and data-quality objectives for the meteorology study are summarized in Table 26-1. All monitoring and data reduction were conducted following the procedures described in *Quality Assurance Project Plan for the Pebble Project Meteorological Monitoring Program*

(copy provided as Appendix 26A). The quality assurance project plan was updated in June 2008 to include new stations (Appendix 26B). The measurement quality objectives and acceptance criteria for the monitoring as defined in the quality assurance project plan are prescribed in *EPA Meteorological Monitoring Guidance for Regulatory Modeling Applications* (EPA, 2000) and *EPA Requirements for Quality Assurance Project Plans* (EPA, 2001.)

26.7 Results and Discussion

26.7.1 Data Collection and Capture

Meteorological data-capture at the Port Site 1 station began in August 2005. In 2007 the monitoring year for the Pebble meteorological monitoring program was switched to a calendar-year system (effective January 1, 2006) so that all meteorological monitoring reports for all monitoring stations within the study area would use the same reporting schedule. Meteorological data collected at the Port Site 1 station from August 1 through December 31, 2005, are described in *Pebble Port Station First Annual Data Report, August 2005–July 2006, for the Pebble Project Meteorological Monitoring Program* (Appendix 26C). Data collected at Port Site 1 for the calendar year January through December 2006 can be found in *Pebble Port Station 2006 Annual Data Report, January 2006–December 2006, for the Pebble Project Meteorological Monitoring Program* (Appendix 26D). (Please note that an overlap of seven months of data exists between these two reports.) Meteorological data collected from January through December 2007 at Port Site 1 can be found in *2007Annual Data Report, Pebble Port Station, for the Pebble Project Meteorological Monitoring Program* (Appendix 26E), and meteorological data collected from January through December 2008 are in *2008 Annual Data Report, Pebble Port Station, for the Pebble Project Meteorological Monitoring Program* (Appendix 26F).

Meteorological data-capture at the Williamsport station began in January 2008, and the data collected from January through December 2008 are described in *2008 Annual Data Report, Pebble Williamsport Station, for the Pebble Project Meteorological Monitoring Program* (Appendix 26G).

Meteorological data-capture at the North Head station began in January 2008, and the data collected from January through December 2008 are presented in *2008 Annual Data Report, Pebble North Head Station, for the Pebble Project Meteorological Monitoring Program* (Appendix 26H).

Data-capture statistics for wind speed, wind direction, temperature, precipitation, and evaporation are provided in Tables 26-2 through 26-5. At the Port Site 1 station data capture was greater than 90 percent per quarter for all parameters during all quarters when monitoring was conducted from 2005 - 2008. At the Williamsport station data capture was greater than 90 percent per quarter for all parameters during all four quarters of 2008. At the North Head station, data-capture for 2008 exceeded 90 percent per quarter for all parameters discussed in this chapter. Data-capture for the primary sensor for the wind speed and direction did not exceed 90 percent per quarter for the first quarter of 2008. The Climatronics sensor was damaged during a storm in January 2008, resulting in data-capture rates for wind speed and wind direction of 67.2 percent for January and 77.3 percent for February. Instrument repairs were completed on February 7, 2008, and data-capture for March was 100 percent. However, the secondary (R.M. Young) wind speed and direction sensor had greater than 90 percent data-capture throughout the quarter. Both the primary and secondary wind speed and wind direction sensors meet all quality assurance specifications.

The secondary instruments are installed and operated in the event that the primary instrument fails so that meeting the minimum data recovery criterion of 90 percent per quarter is enabled.

Meteorological data are summarized below (additional information is provided in Appendices 26C through 26H).

26.7.2 Wind Direction

Figure 26-2 shows wind roses for two collocated wind instruments at the Port Site 1 station. As shown by the wind roses, the predominant wind direction from August 1, 2005, through December 31, 2008, was northerly. (Note that wind direction indicates the direction from which the wind is blowing, e.g., a northerly wind blows from the north.) The most common wind directions at Port Site 1 during this period (as indicated by the primary Climatronics sensor) were as follows:

- Northerly approximately 35 percent of the period.
- Northeasterly approximately 24 percent of the period.
- Northwesterly approximately 14 percent of the period.
- Southerly approximately 10 percent of the period.

The predominant wind directions of northerly and northeasterly reflect effects on synoptic flow (i.e., the large-scale wind pattern) caused by the north-south orientation of the mountains on either side of Iniskin Bay. The less frequent northwesterly winds likely occur during periods of high pressure when the synoptic flow is minimized and the slope-drainage winds from the mountain west of the monitoring station dominate the flow pattern. The still less frequent southerly winds occur most often from April through September when high pressure systems created in the Pacific Ocean build up and push the air to the north.

Figure 26-3 shows wind roses for two collocated wind instruments at the Williamsport station. The predominant wind direction from January 1 through December 31, 2008, was westerly. The most common wind directions at the Williamsport station during this period (as indicated by the primary Climatronics sensor) were as follows:

- Westerly approximately 50 percent of the period.
- Easterly approximately 19 percent of the period.
- Northwesterly approximately 15 percent of the period.

The predominant westerly winds result from the station's location in a valley oriented west to east, which creates slope-drainage winds from the mountains to the west of the station. The easterly winds most likely occur from the slope-drainage winds from the mountains to the east of the monitoring station, and the northwesterly winds likely occur from the slope-drainage winds from the mountains northwest of the monitoring station.

Figure 26-4 shows wind roses for two collocated wind instruments at the North Head station. The predominant wind direction from January 1 through December 31, 2008, was northwesterly. The most

common wind directions at the North Head location during this period (as indicated by the primary Climatronics sensor) were as follows:

- Northwesterly approximately 48 percent of the period.
- Easterly approximately 26 percent of the period.

The predominant northwesterly winds result from westerly winds being deflected by the mountains slightly northwest of the station on the east side of Iliamna Bay. The winds then travel toward the southeast to the monitoring station. The less frequent easterly winds happen most often from April to September and occur from unobstructed pathways from Cook Inlet.

26.7.3 Wind Speed

Table 26-6 summarizes the monthly mean wind speeds and maximum hourly mean wind speeds for Port Site 1 from 2005 through 2007. Tables 26-7 and 26-8 show the monthly mean wind speeds and maximum hourly mean wind speeds for calendar year 2008 for the Port Site 1, Williamsport, and North Head stations. The highest monthly mean wind speeds for the three stations were as follows:

- Port Site 1: 7.0 meters per second (m/sec) [15.7 miles per hour (mph)] in January 2007.
- Williamsport: 7.5 m/sec (16.8 mph) in January 2008.
- North Head: 10.6 m/sec (23.7 mph) in April 2008.

The highest maximum hourly mean wind speeds are shown below:

- Port Site 1: 20.7 m/sec (46.3 mph) in February 2008.
- Williamsport: 15.7 m/sec (35.1 mph) in January 2008.
- North Head: 29.3 m/sec (65.5 mph) in February 2008.

No hourly average calm winds were observed according to data from the primary Climatronics instruments at each station.

26.7.4 Temperature

Table 26-9 summarized the monthly temperature data (monthly mean, maximum daily mean, minimum daily mean, maximum hourly mean, and minimum hourly mean) for Port Site 1 from 2005 through 2007. For calendar year 2008 for Port Site 1, Williamsport, and North Head, monthly mean temperature, maximum daily mean temperature, minimum daily mean temperature, maximum hourly mean temperature, and minimum hourly mean temperature are summarized in Tables 26-10, 26-11, 26-12, 26-13, and 26-14, respectively. (The temperature data presented below and in the corresponding tables are for 2 meters above grade; temperature data for 10 meters above grade are presented in Appendix 26H.) The lowest and highest monthly mean temperatures, respectively, for the three stations were as follows:

- Port Site 1: -8.4 degrees Celsius (°C) [16.9 (°F) in March 2007 and 14.3°C (57.7 °F) in August 2005.

- Williamsport: -9.5°C (14.9 °F) in January 2008 and 12.3°C (54.1 °F) in August 2008.
- North Head: -8.4°C (6.9 °F) in January 2008 and 12.3°C (54.1 °F) in August 2008.

The minimum and maximum daily mean temperatures by month are listed below:

- Port Site 1 ranged from a minimum of -22.3°C (-8.1 °F) in January 2006 to a maximum of 20.3°C (68.5 °F) in June 2007.
- Williamsport ranged from a minimum of -25.2°C (-13.4 °F) in January 2008 to a maximum of 17.5°C (63.5 °F) in July 2008.
- North Head ranged from a minimum of -22.7°C (-8.9 °F) in January 2008 to a maximum of 17.3°C (63.1 °F) in July 2008.

Shown below are the minimum and maximum hourly average temperatures, respectively:

- Port Site 1: -24.1°C (-11.3 °F) in January 2006 and 25.2°C (77.4 °F) in June 2007.
- Williamsport: -26.2°C (-15.2 °F) in January 2008 and 22.2°C (72.0 °F) in July 2008.
- North Head: -24.2°C (-11.6 °F) in January 2008 and 21.0 °C (69.8 °F) in July 2008.

The locations of the monitoring stations adjacent to the cool waters of Iniskin Bay and Iliamna Bay cause the air-temperature extremes to be moderated.

26.7.5 Precipitation

Precipitation monitoring began at Port Site 1 on July 15, 2008, and is ongoing. The total monthly and maximum daily precipitation data for Port Site 1 are summarized in Table 26-15. The highest monthly precipitation was 370.8 millimeters (mm) (14.6 inches) in September 2008 and the lowest was 45.5 mm (1.8 inches) in December. The highest daily precipitation was 70.9 mm (2.8 inches) in September.

No precipitation data were collected at Williamsport or North Head because the precipitation pattern is similar to Port Site 1 at which precipitation data were collected.

26.7.6 Evaporation

Evaporation monitoring began at Port Site 1 on July 15, 2008, and was decommissioned on October 16, 2008 for the winter, prior to freezing temperatures that would reduce evaporation rates to zero. A summary of total monthly evaporation for Port Site 1 is provided in Table 26-15. The highest and lowest monthly evaporation, respectively, were 50.6 mm (2.0 inches) in July and 12.1 mm (0.5 inches) in October. Since monitoring began in the middle of a month and ended in the middle of another month, the highest and lowest evaporation data may be biased. Evaporation rates for the three one-month-long periods during the 2008 monitoring are as follows:

- July 15 through August 14: 74.1 mm (2.9 inches) evaporated.
- August 15 through September 14: 27 mm (1.1 inches) evaporated
- September 15 through October 16: 32.2 mm (1.3 inches) evaporated.

No evaporation data were collected at Williamsport or North Head because the evaporation pattern is similar to Port Site 1 at which evaporation data were collected.

26.8 Summary

The climate in the port study area is transitional with a strong maritime influence because of its proximity to Cook Inlet. The wind direction for Port Site 1 is generally from the north and northeast because of local terrain influences. The wind direction for Williamsport is generally from the west because of slope-drainage influences from the mountains. The wind direction for North Head is generally from the northwest because of slope-drainage influences from the mountains. Daily mean temperatures ranged from a minimum of -22.3°C (-8.1 °F) to a maximum of 20.3°C (68.5 °F) at Port Site 1, from a minimum of -25.2°C (-13.4 °F) to a maximum of 17.5°C (63.5 °F) at Williamsport, and from a minimum of -22.7°C (-8.9 °F) to a maximum of 17.3°C (63.1 °F) at North Head. Temperatures are moderated by the cool open waters of Iniskin and Iliamna bays. Port Site 1 began monitoring precipitation in July 2008 and recorded the highest monthly precipitation of 370.8 mm (14.6 inches) in September 2008. Evaporation monitoring at Port Site 1 also began in July 2008 and stopped in October for the winter. The highest monthly evaporation recorded was 50.6 mm (2.0 inches) for July, even though monitoring did not begin until July 15.

26.10 Glossary

Synoptic Scale: The size of weather patterns ranging from approximately 1,000 kilometers (620 miles) in length and/or width to approximately 2,500 kilometers (1,500 miles) in length and/or width.

Transitional Climatic Zone: Under the Köppen climate classification8, the transitional zone is identified as a Maritime Subarctic Climate. These climates are generally found poleward and are confined to narrow coastal strips (to include the adjacent islands) on the western margins of continents. Both continental and maritime climate systems affect the transitional zone. The climate must have moderate moisture in all seasons.

Wind Rose: A wind rose is a graphic tool used by meteorologists to give a succinct view of how wind speed and direction are typically distributed at a particular location. Presented in a circular format, the wind rose shows the frequency of winds blowing *from* particular directions. The length of each "spoke" around the circle is related to the frequency that the wind blows from a particular direction per unit time. Each concentric circle represents a different frequency, emanating from zero at the center to increasing frequencies at the outer circles.

TABLES

TABLE 26-1
Meteorological Measurement Methods and Data-quality Objectives

Meteorological Parameter (Equipment Make/Model)	**Measurement Method**	**Manufacturer-specified Accuracy**	**EPA-required Accuracy** [a]	**EPA-required Resolution** [a]	**Detectability/ Data Completeness** [a]
Wind Speed (Climatronics F460)	Three-cup anemometer	±0.07 m/sec or ±1%	±0.2 m/sec or ±5%	0.1 m/sec	90% per monitoring quarter
Wind Direction (Climatronics F460)	Light-weight vane	±2 degrees	±5 degrees	1.0 degree	90% per monitoring quarter

	October	99.3	93.6
	November	100	N/A
	December	100	N/A

N/A = not applicable, parameter was not measured at this station during this month

TABLE 26-6
Summary of Monthly Mean and Monthly Maximum Hourly Mean Wind Speeds—
Port Site 1, 2005 through 2007

Year	Month	Monthly Mean Wind Speed (meters/second)	Maximum Hourly Mean Wind Speed (meters/second)
2005	August	3.6	12.6
	September	5.0	17.7
	October	4.9	15.5
	November	5.9	16.5
	December	6.3	14.5
2006	January	5.5	20.4
	February	6.3	16.3
	March	5.0	16.2
	April	5.1	14.8
	May	3.9	11.5
	June	3.3	10.9
	July	3.9	16.0
	August	3.9	13.6
	September	4.1	11.9
	October	4.9	14.2
	November	5.3	15.1
	December	6.1	18.4
2007	January	7.0	16.6
	February	4.3	13.6
	March	5.6	16.5
	April	5.6	14.3
	May	3.7	11.1
	June	3.3	11.5
	July	3.0	13.4
	August	3.5	14.3
	September	4.0	13.6
	October	5.5	13.1
	November	6.5	14.1
	December	6.2	14.5

Multiply by 2.24 to convert meters per second to miles per hour. Example: 4 m/sec * 2.24 = 9.0 mph.

A4. Project/Task Organization

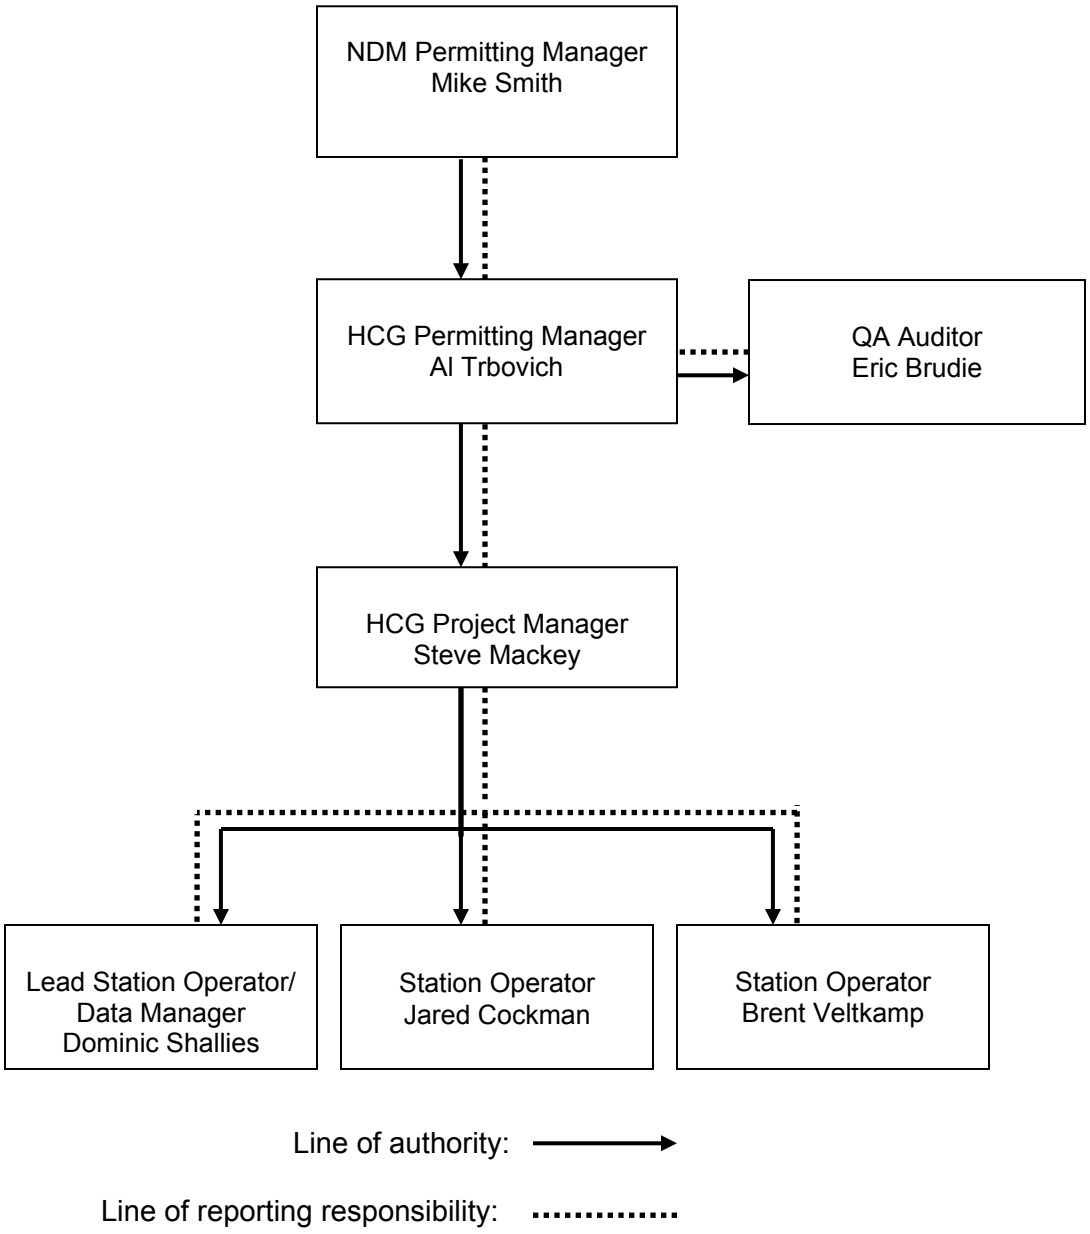
Hoefler Consulting Group (HCG) will support Northern Dynasty Mines Inc. (NDM) in the installation, operation, and maintenance of meteorological monitoring stations for the Pebble Project located near Iliamna, Alaska. Figure A1 provides the organization plan for this project. The key personnel involved with this project and their respective responsibilities are

summarized in Table A2. HCG will be responsible for all aspects of air monitoring, database management, and reporting.

Table A2. Pebble Project Meteorological Monitoring Program Key Individuals and Responsibilities

Key Individual	Responsibilities
NDM Permitting Manager	Mike Smith is the permitting manager for the Pebble Project and is responsible for complete program oversight.
HCG Permitting Manager	Al Trbovich is responsible for coordinating the meteorological monitoring program with NDM air permitting requirements.
HCG Project Manager	Steve Mackey is responsible for management of the technical staff conducting the NDM meteorological monitoring program and ensuring that the project is completed within established schedules and budgets.
Quality Assurance Auditors	Eric Brudie is responsible for auditing the validity and accuracy of reported information and coordinating follow-up activities to ensure a defensible data set.
Field/Site Operations	Dominic Shallies, Jared Cockman, and Brent Veltkamp are responsible for installation and routine operation of the monitoring stations.
Data Manager	Dominic Shallies is responsible for maintaining the project databases for all field data and for preparing data reports.

Figure A1. Pebble Project Meteorological Monitoring Program Organizational Chart



A5. Problem Definition/Background and Project Objective

The Pebble Project is a proposed mine for gold, copper, molybdenum, and silver located in southwestern Alaska, north of Lake Iliamna. NDM is conducting baseline environmental studies at the Pebble Project, including meteorological monitoring to support air permitting, environmental studies, and mine design objectives. At least two years of meteorological monitoring is anticipated with a primary objective of collecting meteorological data for supporting future air permit applications required for mining activities, construction and/or roadwork at the proposed mine and port sites.

The meteorological data will be collected in accordance with Prevention of Significant Deterioration (PSD) permit requirements and guidance. While construction of the mine and port infrastructure may not require a PSD permit, the PSD-quality meteorological measurements may also be used for air dispersion modeling required for minor permitting.

A6. Project/Task Description

This study will provide two years of representative surface meteorological observations for use in air quality dispersion modeling in support of the Pebble Project. The meteorological monitoring program will include three PSD-quality stations as follows:

- Mine PSD station (also referred to as the Pebble 1 station)
- Tailings Storage Facility PSD station (also referred to as the Pebble 4 station)
- Port PSD station (also referred to as the Pebble Port station)

The study will collect two years of meteorological data at the proposed Pebble mine area (Mine PSD station) and near the proposed port site (Port PSD station). The study will also provide one year of meteorological monitoring in the proposed tailings storage facility site (Tailings Storage Facility PSD station).

Two other non-PSD meteorological monitoring stations, known as the Pebble 2 and Pebble 3 stations, have also operated in the Pebble area to collect data for mine design purposes. These non-PSD stations are not included as part of this QAPP, as these stations are not intended to provide data for air dispersion modeling.

The meteorological monitoring stations for this project will use PSD quality equipment to monitor the following parameters on an hourly basis:

- Wind speed (meters/second [m/s])
- Wind direction (degrees [°])
- Wind direction standard deviation (sigma-theta [σ_θ])

- Temperature (degrees Celsius [°C])
- Vertical temperature difference (ΔT), 2-meter to 10-meter (degrees Celsius [°C])
- Relative humidity (percent [%])
- Solar radiation (watts per square meter [W/m^2])
- Barometric pressure (millibars [mbar])
- Precipitation (millimeters [mm]) (not included at Port PSD station)
- Evaporation (millimeters [mm]) (not included at Port PSD station)

The meteorological monitoring sites for the Pebble Project were selected in a manner consistent with PSD criteria for surface meteorological data collection. Figure A2 shows a map of the NDM meteorological monitoring sites located in southwest Alaska. On May 24, 2005, the proposed monitoring sites were visited by Alan Schuler and Gerry Guay of Alaska Department of Environmental Conservation (ADEC), Natasha Greaves and Rob Wilson of the United States Environmental Protection Agency (EPA) Region 10, and Al Trbovich and Steve Mackey of HCG. On this date, all parties concurred that the selected sites are the best available locations for carrying out meteorological monitoring representative of the areas proposed for development. Greater details of the monitoring site locations and the proximity of the study areas within defined Alaska land use boundaries are provided in Sections B1 and B9, respectively.

The Pebble Project Meteorological Monitoring Program is expected to run from August 1, 2005 to July 31, 2007 (two years). The first year of PSD monitoring will take place from August 1, 2005 to July 31, 2006. The second year of monitoring will take place from August 1, 2006 to July 31, 2007. The annual reports for this project are scheduled for submission to Northern Dynasty within ninety days following the completion of each year of monitoring. For purposes of data reporting, the two years of monitoring will be split into monitoring quarters as follows:

Year Number 1 (8/1/2005 – 7/31/2006)

Monitoring Quarter A	Aug/Sep/Oct 2005
Monitoring Quarter B	Nov/Dec/Jan 2005-2006
Monitoring Quarter C	Feb/Mar/Apr 2006
Monitoring Quarter D	May/Jun/Jul 2006

Year Number 2 (8/1/2006 – 7/31/2007)

Monitoring Quarter E	Aug/Sep/Oct 2006
Monitoring Quarter F	Nov/Dec/Jan 2006-2007
Monitoring Quarter G	Feb/Mar/Apr 2007
Monitoring Quarter H	May/Jun/Jul 2007

Personnel working on this project will be selected by the HCG project manager and will be fully qualified, trained, and capable of their assigned tasks. Work schedules will be

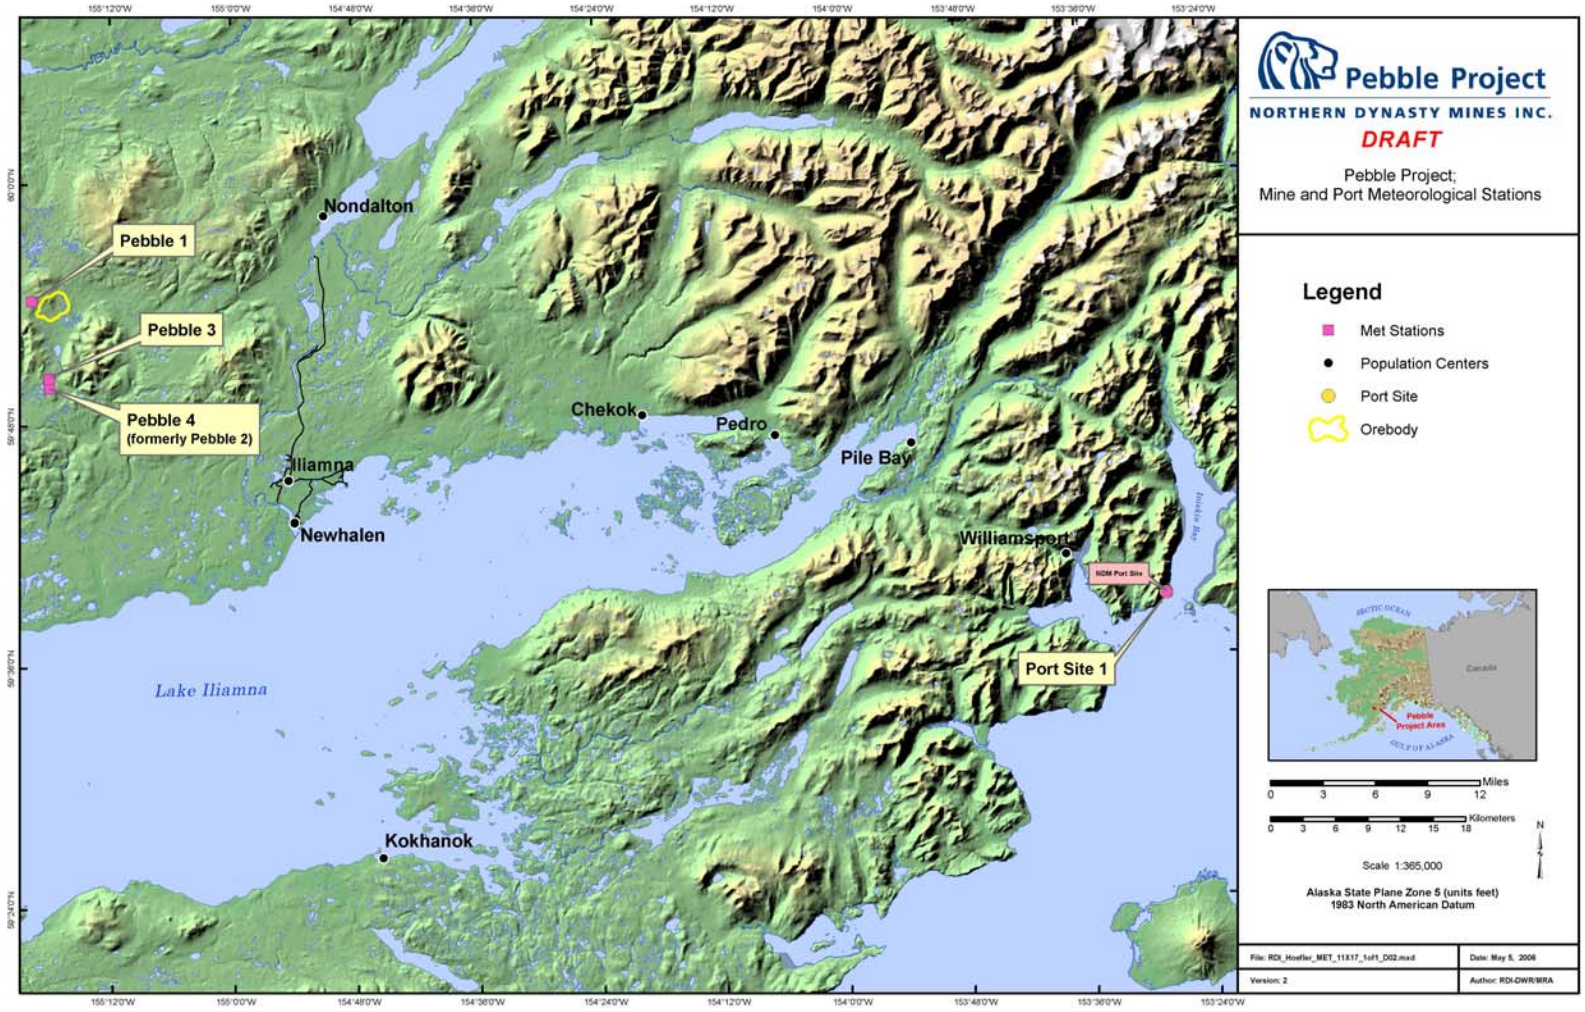
determined by the HCG project manager and will include: (a) daily data reviews, (b) site visits every four to eight weeks, (c) semiannual audits and audit reports, (d) quarterly data summaries, (e) annual data reports, and (f) as needed maintenance and corrective actions. Table A3 provides a provisional work schedule for this monitoring project.

Table A3. Pebble Project Meteorological Monitoring Program Work Schedule

Scheduled Activity	Date
Station Site Selection Visit	May 24, 2005
Installation of the Mine PSD Station (Pebble 1) and the Port PSD Station	June 2005
Training of Station Operators	June 2005
Mine PSD Station and Port PSD Station Initial Systems/Performance Audit and Calibrations	June 11 and June 25, 2005
Start of Two Year Monitoring Period[1]	August 1, 2005
Semiannual Performance Audit and Calibrations	January 15-16, 2006
Tailings Storage Facility PSD Station (Pebble 4) Installation	June 3-10, 2005
First Year of Monitoring Ends	July 31, 2006
Second Year of Monitoring Begins	August 1, 2006
Annual Systems/Performance Audit and Calibrations	July/August 2006
Semiannual Performance Audit and Calibrations	January 2007
Annual Systems/Performance Audit and Calibrations	June 2007
End of Two Year Monitoring Period	July 31, 2007

[1] The start of the PSD monitoring period was delayed until August 1, 2005 to resolve a temperature sensor problem in July 2005.

Figure A2. Pebble Project Area Map



A7. Quality Objectives and Criteria for Measurement of Data

Measurement Quality Objectives (MQOs) and acceptance criteria for the project are defined by the MQOs as prescribed in *EPA Meteorological Monitoring Guidance for Regulatory Modeling Applications,* Sections 3 and 5 (EPA-454/R-99-005), and by the guidelines defined in *EPA Requirements for Quality Assurance Project Plans* Chapter 3, Section A7 (EPA QA/R-5).

Data completeness is a measure of the amount of data actually collected compared with the amount of data that could have been collected, expressed as a percentage. Data completeness for the meteorological sensors is calculated by dividing the number of valid hours of data by the total number of hours during the monitoring period. The Data Quality Objective (DQO) for data completeness during this monitoring project is 90 percent data capture per quarter for every parameter listed in Table A4.

DQOs for the detection capabilities of the meteorological sensors are defined in terms of measurement resolution. The resolution DQOs for this project have been set equal to those put forth in *Meteorological Monitoring Guidance for Regulatory Modeling Applications* Section 5.1 (EPA-454/R-99-005), and are presented in Table A4.

Accuracy is a measure of the proximity of the measurements and the true value. Accuracy includes components of both random error and systematic error associated with instrumental bias. Accuracy will be assessed during performance audits. The accuracy DQOs for the meteorological sensors are presented in Table A4, and have been set equal to those recommended in *Meteorological Monitoring Guidance for Regulatory Modeling Applications,* Section 5.1 (EPA-454/R-99-005).

Detectability, method/comparability, and representativeness are determined by the siting and exposure of the meteorological tower and sensors. The space-time domain and aspects for this specific application--as prescribed in *Meteorological Monitoring Guidance for Regulatory Modeling Applications,* Section 3.1.1 Objective for Siting (EPA-454/R-99-005)--have been considered for each measurement parameter.

Table A4. Summary of DQOs for the Pebble Project Meteorological Monitoring Program

Meteorological Parameter/ Manufacturer and Model	Measurement Method	Manufacturer Specified Accuracy	EPA Required Accuracy[1]	EPA Required Resolution[1]	Detectability/ Data Completeness[1]
Wind Speed (Climatronics F460)	Three-cup anemometer	± 0.07 m/s or ± 1%	± 0.2 m/s or ± 5%	0.1 m/s	90% per monitoring quarter
Wind Direction (Climatronics F460)	Light-weight vane	± 2 degrees	± 5 degrees	1.0 degree	90% per monitoring quarter
Wind Speed (RM Young 05305-AQ)	Light-weight propeller	± 0.2 m/s	± 0.2 m/s or ± 5%	0.1 m/s	90% per monitoring quarter
Wind Direction (RM Young 05305-AQ)	Light-weight vane	± 3 degrees	± 5 degrees	1.0 degree	90% per monitoring quarter
Ambient Temperature & Vertical Temperature Difference (Met One 062MP)	Solid state Thermistor	± 0.05°C	± 0.5°C (Ambient Temperature), ± 0.1°C (Temperature Difference)	0.1°C (Ambient Temperature), 0.02°C (Temperature Difference)	90% per monitoring quarter
Barometric Pressure (Vaisala PTB101B)	Silicon capacitive sensor	± 0.3 mbar	± 3 mbar	0.5 mbar	90% per monitoring quarter
Relative Humidity (Vaisala HMP45C)	Thin-polymer capacitor	± 2% (0-90% range) ± 3% (90-100% range)	± 1.5°C	0.1°C	90% per monitoring quarter
Solar Radiation (Licor LI200X)	Silicon photovoltaic detector	± 5%	± 5%	10 W/m^2	90% per monitoring quarter
Precipitation (ETI NOAH II)	Water pressure	± 0.25 mm	± 5 mm	0.3 mm	90% per monitoring quarter
Evaportation (Nova Lynx 255-100)	Float mechanism/ sensor	± 0.25%	n/a[3]	n/a[3]	90% per monitoring quarter

[1] Referenced in *Meteorological Monitoring Guidance for Regulatory Modeling Applications* (EPA-454/R-99-005).
[2] Values are given in terms of dew point temperature in guidance document (EPA-454/R-99-005).
[3] n/a = not applicable.

A8. Training and Certifications

The Pebble Project meteorological monitoring sites require no specific mandated training requirements as stated in *EPA Requirements for Quality Assurance Project Plans* Section A8 (EPA QA/R-5). However, a site-specific health and safety plan was developed in accordance with both HCG and NDM standards. Site-specific training for this project covers activities performed in the field and includes record keeping practices. All HCG and NDM field personnel will attend annual site safety and logistics meetings hosted by NDM. HCG field technicians for this project will receive training on the operation and maintenance of the meteorological sensors and related equipment. Training will be conducted by the HCG project manager or his designees. Site-specific training checklists and site visit memos will document the specific training received by each Field Technician (Appendix B). These documents will be filed and maintained in the project files.

A9. Documents and Records

Documentation and records for this project will include equipment calibration and maintenance records, documentation of quality control/quality assurance activities, routine monitoring data, corrective action and resolution forms, any QAPP revision documentation, and records of HCG field activities (i.e. site visit memos). Appendix B includes example data sheets for the monitoring project. All hard-copy documentation will be stored at the HCG Anchorage office and retained for a period of at least five years from the completion of the project. Electronic data will be stored on various media with full project backups. In addition to any written reports, electronic data collected for this project and data transferred to electronic format will be provided to NDM via CD-ROM or e-mail. Both the original comma delimited raw text file and a spreadsheet format file will be provided.

The final annual reports will be submitted to ADEC and NDM in both hard copy and electronic (PDF) format within 90 days of the conclusion of the monitoring program. Validated data will be submitted to ADEC in the same formats. The annual report will include a brief discussion of any monitoring phenomena, observable trends, quarterly and annual averages for all the measured parameters, statistical summaries for each collected parameter, and wind rose graphics. The reports will also contain any additional documentation, including but not limited to equipment calibration and maintenance records, documentation of quality control/quality assurance activities, routine monitoring data, project data reports, corrective action records, and records of field activities. Examples of these documentation forms are provided in Appendix B. See Section C for an outline of the annual report.

In accordance with ADEC reporting guidelines, quarterly data summaries and annual data reports will be prepared by HCG and provided to NDM and ADEC. Two separate annual data reports will be prepared (one for each monitoring year, not calendar year).

The final annual data reports will conform to format requirements set forth in *PSD Quality Ambient Air Quality & Meteorological Monitoring Annual Data Report Format* (ADEC, March 2005). The annual data reports will be submitted to ADEC after the department has received the QAPP.

In addition to the annual data reports, quarterly data summaries will be prepared by HCG in accordance with the format described in *PSD Quality Ambient Air Quality & Meteorological Monitoring Quarterly Data Summary Format* (ADEC, March 2005) and provided to NDM and ADEC within 30 days after the completion of each calendar quarter. The quarterly data summaries will be submitted to ADEC in conclusion of each monitoring year.

B. Measurement and Data Acquisition

B1. Sampling Process Design

The identified objectives of the Pebble Project Meteorological Monitoring Program are:

- Collect meteorological data necessary to support air permit applications
- Collect data for other environmental purposes (baseline, NEPA)
- Collect data for engineering design of mine and port facilities

To accomplish the monitoring objectives, baseline meteorological monitoring is being performed in both the proposed mine region (two stations) and the proposed port site (one station). The monitoring study is comprised of three PSD quality meteorological monitoring stations, each of which will collect meteorological monitoring data over a period of two years. The three PSD stations are designed and operated to meet the data quality objectives previously outlined in Section A7 of this QAPP.

B1.1 Monitoring Site Locations

The Pebble Project area is located near Iliamna in southwestern Alaska. The mine area stations are located approximately 17 miles northwest of Iliamna and the Port station is located approximately 52 miles east of Iliamna on the eastern shore of Iniskin Bay. The specific station locations are shown in Figure A2.

The meteorological monitoring program consists of a total of three PSD quality meteorological monitoring stations, the Mine PSD Station (Pebble 1), the Tailings Storage Facility PSD Station (Pebble 4), and the Port PSD Station (Pebble Port). An additional non-PSD meteorological monitoring station is being used to collect data for mine design purposes. This non-PSD station was initially located at the Pebble 4 station site from October 2004 through November 2005, and was called the “Pebble 2” station. During November 2005, the Pebble 2 station was relocated 0.6 miles north and renamed “Pebble 3”. Table B1 provides a summary of the location, purpose, and measurement parameters of PSD and non-PSD meteorological monitoring stations for the Pebble Meteorological Monitoring Program. Throughout the remainder of this QAPP, emphasis will be placed on the locations and operation of the PSD meteorological monitoring stations only, as their primary purpose is to provide measurements for air dispersion modeling and air permit applications.

Figure B1 shows a map of the meteorological stations adjacent to the Pebble Project ore body, located approximately 15 to 20 miles west northwest of Iliamna, Alaska. Figures B2 and B3 provide higher resolved maps of the Pebble 1 and Pebble 4 station locations, which are situated atop gradual sloping hills that lie to the west and south, respectively, of the main

ore body. The Pebble 1 station is located at a northern edge of a hilltop at 1,600 feet above sea level and overlooks a basin to the west where the Pebble Project ore body is located. The Pebble 4 station is located at 1,200 feet above sea level and overlooks the Pebble 3 station (at 1,000 feet above sea level) and the drainage of Frying Pan Lake, which is located within the area of the proposed mine tailings storage facility.

Figures B4 and B5 are photos of the Pebble 1 station and the surrounding area in the four cardinal directions, respectively. Figures B6 and B7 provide respective photographs of the Pebble 4 station and the surrounding area in the four cardinal directions. Despite the relatively low elevation of the sites, both meteorological stations sit above tree line and are free of natural and man-made obstructions.

Figure B8 is a map of the Pebble Port station. Figure B9 and B10 are photos of the Pebble Port station and the surrounding area in the four cardinal directions, respectively. The Pebble Port station overlooks the western shores of Iniskin Bay at the site of the proposed Pebble Project shipping port.

Table B1. Summary of Pebble Project Meteorological Stations

Station Name	Purpose/ Function[1]	Station Coordinates and Elevation	Monitoring Period	Measured Meteorological Parameters
Pebble 1 (Mine PSD Station)	PSD quality meteorological monitoring for proposed mine site	59° 54' N 155° 20' W 1,600 feet	Aug. 1, 2005 - July 31, 2007	Wind speed
				Wind direction
				Wind sigma
				Temperature
				Δ Temperature
				Solar radiation
				Barometric pressure
				Precipitation
				Evaporation
Pebble 2	Non-PSD meteorological monitoring at the proposed mine tailings storage facility site	59° 50' N 155° 18' W 1,200 feet	Jan. 2005 – Nov. 2005	Wind speed
				Wind direction
				Wind sigma
				Temperature
				Precipitation
				Evaporation
Pebble 3	Non-PSD meteorological monitoring at the proposed mine tailings storage facility site	59° 50' N 155° 18' W 1,000 feet	Nov. 2005 – July 2007	Wind speed
				Wind direction
				Wind sigma
				Temperature
				Precipitation
				Evaporation
Pebble 4 (Tailings Storage Facility PSD Station)	PSD quality meteorological monitoring for proposed mine site	59° 50' N 155° 18' W 1,200 feet	Aug. 1, 2006 – July 31, 2007	Wind speed
				Wind direction
				Wind sigma
				Temperature
				Δ Temperature
				Solar radiation
				Barometric pressure
				Precipitation
				Evaporation
Pebble Port (Port PSD Station)	PSD quality meteorological monitoring at proposed port site	59° 39' N 153° 28' W 40 feet	Aug. 1, 2005 - July 31, 2007	Wind speed
				Wind direction
				Wind sigma
				Temperature
				Δ Temperature
				Solar radiation
				Barometric pressure

[1]Each PSD station measures winds at approximately 10-meters height and is operated in accordance to *Meteorological Monitoring Guidance for Regulatory Modeling Applications* (EPA-454/R-99-005). Non-PSD stations measure wind at 3-meters height and are operated primarily for engineering design.

B2. Sampling Methods Requirements

Measurements will be performed using appropriate monitoring methods to ensure that the data are representative of actual conditions. The following sections address the methods to be used throughout the Pebble Project meteorological monitoring program, instrument installation, and the operational environment of the instruments.

B2.1 Reference and Equivalent Methods

Sensors for the measurement of wind speed, wind direction, ambient temperature, vertical temperature difference, barometric pressure, relative humidity, solar radiation, precipitation, and evaporation will be used to collect meteorological data. Table B2 lists the sensors that will be used, in addition to the manufacturers' specifications and the recommended performance specifications stated in *Meteorological Monitoring Guidance for Regulatory Modeling Applications* (EPA-454/R-99-005). These sensors will be continuously operated throughout this meteorological program.

Ambient temperature sensors will be mounted at 2 and 10 meters above ground level and used to measure vertical temperature difference, ΔT ("Delta T"). Two collocated wind speed and wind direction sensors will be mounted at 10 meters above ground level. The two wind measurement systems will include: (1) Climatronics F460 sensors as the primary wind sensors, and (2) a RM Young wind monitor as the secondary or back-up wind sensors. Solar radiation, relative humidity, and barometric pressure measurements will be measured at 4, 2, and 1.5 meters above ground level, respectively. At the Pebble 1 and Pebble 4 stations, the evaporation gauge will be mounted on a leveled deck and surrounded with fencing to avoid animal disturbance. The Pebble 1 and Pebble 4 station precipitation gauges will be mounted inside Wyoming-type (see Figure B4) and Alter Shield-type wind screens to prevent blowing snow and excessive winds from causing spurious readings and to improve catch efficiency. Complete descriptions of sensor audit and calibration methods are located in Appendix B.

Table B3 lists the sampling and averaging times for all of the meteorological variables that will be collected throughout this project. Wind speed, wind direction, temperature, solar radiation, evaporation pan level, and relative humidity will be sampled every second, and will be used to determine the mean hourly values of the measured parameters. Discrete precipitation values will be recorded to the datalogger each time the precipitation sensor detects a signal, and subsequently processed to provide measurements of total precipitation per hour. In addition, instantaneous measurements of barometric pressure will be sampled once every hour.

Table B2. Summary of Meteorological Sensors and Performance Specifications

Meteorological Parameter	Measurement Method	Sensor Characteristics	Manufacturer Specification	Guidance Document
Wind Speed - Primary (Climatronics F460)	Three-cup anemometer	Max Operating Range	0 - 65 m/s	0 - 50 m/s
		Starting Speed	0.22 m/s	0.5 m/s
		Accuracy	± 0.07 m/s or 1%	± 0.2 m/s + 5%
		Temperature Range	-40 ºC to +60 ºC	Not Specified
		Distance Constant	Less than 4.0 m (13.1 ft)	5 m
		Measurement Resolution	0.01 m/s	0.1 m/s
Wind Direction - Primary (Climatronics F460)	Precision low-torque potentiometer	Azimuth	0 - 360º	Not Specified
		Starting Speed[1]	0.22 m/s	0.5 m/s
		Accuracy	± 2º	± 5º
		Damping Ratio[1]	>0.4	0.4 to 0.7
		Delay Distance	< 1 m (3.3 ft)	5 m
		Temperature Range	-40 ºC to +60 ºC	Not Specified
		Measurement Resolution	0.1º	1.0º
Wind Speed - Secondary (RM Young 05305-AQ)	Propeller type anemometer	Max Operating Range	0 - 40 m/s	0 - 50 m/s
		Starting Speed	0.4 m/s	0.5 m/s
		Accuracy	± 0.2 m/s or 1%	± 0.2 m/s + 5%
		Temperature Range	-50 ºC to +50 ºC	Not Specified
		Distance Constant	2.1 m	5 m
		Measurement Resolution	0.01 m/s	0.1 m/s
Wind Direction - Secondary (RM Young 05305-AQ)	Precision low-torque potentiometer	Azimuth	0 - 360º	Not Specified
		Starting Speed	0.5 m/s	0.5 m/s
		Accuracy	± 3º	± 5º
		Damping Ratio	>0.4	0.4 to 0.7
		Delay Distance	1.2 m	5 m
		Temperature Range	-50 ºC to +50 ºC	Not Specified
		Measurement Resolution	0.1º	1.0º
Ambient Temperature and Delta T Met One 062-MP)	Solid state thermistor	Accuracy	± 0.05 ºC	± 0.1 ºC
		Time Constant	3.6 sec	1 min
		Temperature Range	-50 ºC to +50 ºC	-40 ºC to +60 ºC
Solar Radiation (Li-Cor LI200X)	Silicon photovoltaic detector	Accuracy	± 5 %	± 5 % of observed
		Time Constant	1 sec	5 sec
		Spectral Response[2]	400 nm to 1,100 nm	285 nm to 2,800 nm
		Temperature Range	-40 ºC to +65 ºC	-20 ºC to +40 ºC
Barometric Pressure (Vaisala PT101B)	Silicon capacitive absolute pressure sensor	Accuracy	± 0.5 mb	± 3 mb
		Temperature Range	-40 ºC to +60 ºC	Not specified
		Measurement Resolution	< 0.5 mb	0.5 mb
		Measurement Range	600 – 1,060 mb	Not specified

[1] At 10º initial angle of attack

[2] Guidance document allows photovoltaic pyranometers when data will be used to estimate stability.

Table B2 (Continued). Summary of Meteorological Sensors and Performance Specifications

Meteorological Parameter	Measurement Method	Sensor Characteristics	Manufacturer Specification	Guidance Document
Relative Humidity (Vaisala HMP45AC)	Capacitance change of a polymer thin film capacitor	Accuracy	± 2 % RH	± 1.5ºC [3]
		Time Constant	15 sec	30 min
		Temperature Range	-40 ºC to +60 ºC	-30 ºC to +30 ºC
		Measurement Resolution	0.1 % RH	0.1 ºC [3]
		Measurement Range	0-100% RH	-30 ºC to +30 ºC
Precipitation (ETI NOAH II)	Pressure of water column above a load cell mechanism	Accuracy	± .254 mm	± 0.5 mm
		Temperature Range	-30 ºC to +50 ºC	Not specified
		Measurement Resolution	± 0.254 mm	0.3 mm
		Measurement Range	0 to 12 in	Not specified
Evaporation (Nova Lynx 255-100)	Change in pressure head determined by float mechanism	Accuracy	± 0.25% over 10" range	Not specified
		Time Constant	1 sec	Not specified
		Temperature Range	0 ºC to 60 ºC	Not specified
		Measurement Resolution	1.0 mm	Not specified
		Measurement Range	3 to 10 in	Not specified

[3] Guidance document specifies values for dew point, not relative humidity.

Table B3. Sampling and Averaging Times for Meteorological Parameters

Meteorological Parameter	Sampling time	Averaging time
Wind Speed	1 sec	1 hr
Wind Direction	1 sec	1 hr
Wind Sigma	1 sec	1 hr
Temperature	1 sec	1 hr
Δ Temperature	1 sec	1 hr
Solar Radiation	1 sec	1 hr
Relative Humidity	1 sec	1 hr
Evaporation	1 sec	1 min
Precipitation[1]	n/a	n/a
Barometric Pressure[2]	1 hr	n/a

[1] Instantaneous precipitation measurements are collected by the datalogger and subsequently summed on an hourly basis.
[2] Instantaneous pressure measurements are sampled once per hour.

B2.2 Environmental Controls

Weatherproof enclosures and/or structures will be installed at each monitoring site for protection of the datalogger, batteries, modem, and barometric pressure sensor. Each monitoring station will be properly grounded to prevent damage from possible lightning strikes. To assure accurate temperature data, each temperature sensor will be mounted within identical fan-aspirated solar radiation shields.

B3. Sample Handling and Custody

Not applicable. No physical samples will be taken as part of this project.

B4. Analytical Methods Requirements

The meteorological sensors to be used for this project meet the specifications and recommendations in *Meteorological Monitoring Guidance for Regulatory Modeling Applications* (EPA-454/R-99-005) (see Table B2).

B5. Quality Control

Quality Assurance/Quality Control (QA/QC) procedures are required for this project to ensure that the collected meteorological data meet standards of reliability and accuracy. Quality control for this project will follow EPA PSD monitoring requirements presented in *Meteorological Monitoring Guidance for Regulatory Modeling Applications* (EPA-454/R-99-005) and *Ambient Monitoring Guidelines for Prevention of Significant Deterioration (PSD)* (EPA 450/4-87-007).

All monitoring equipment will be acquired from manufacturers whose equipment meets EPA meteorological monitoring guidelines. In no case will inferior equipment be used. The Critical Validation Criteria Table (Table B4) outlines criteria deemed critical to maintaining the integrity of a sample or group of samples. Data that do not meet each and every criterion on the Critical Validation Criteria Table will be invalidated unless compelling reason and justification exist for not doing so. The samples for which one or more of these criteria are not met are invalid unless proven otherwise. The cause for not operating in the acceptable range for each violated criteria will be investigated and future occurrences avoided to reduce the likelihood that additional samples will be invalidated.

The QA/QC Operational Evaluations Table (Table B5) outlines criteria that are important for maintaining and evaluating the quality of the data collection system. Violation of a criterion or a number of criteria may be cause for invalidation of the data. The decision to invalidate data will consider other quality control information that may or may not indicate the data are acceptable. Therefore, a sample or group of samples for which one of these criteria is not

met is suspect unless other quality control information demonstrates otherwise. The reason for not meeting the criteria will be investigated, mitigated, and/or justified.

The Systematic Issues Table (Table B6) outlines criteria important for the correct interpretation of the data but that do not usually impact the validity of a sample or group of samples. For example, data quality objectives are included in this table. Not meeting these data quality objectives does not invalidate any of the samples, but may impact the error rate associated with the attainment/non-attainment decision.

Table B4. Meteorological Sensors QA/QC Critical Validation Criteria

Meteorological Sensors Critical Validation Criteria

B6. Instrument/Equipment Testing and Inspection/Maintenance

B6.1 Acceptance Testing

Prior to installation, all equipment will be visually inspected to ensure no physical damage exists. After installation and prior to the beginning of the monitoring period, sensors will be calibrated according to the procedures stated in their respective operating manuals. Acceptance testing procedures will be documented on the appropriate calibration forms (provided in Appendix B). To ensure that the sensors continue to properly operate during the monitoring period, calibration checks of the instruments will be conducted semiannually as outlined in Section C1.1 of this QAPP.

B6.2 Site Surveillance and Equipment Inspection and Maintenance

HCG station operators will visit the monitoring station to inspect the condition of the monitoring equipment every 4 to 8 weeks and as needed. During each visit the following tasks will be conducted:

- Check the tower and sensors for signs of storm damage and/or vandalism;
- Observe the sensors to determine if the units appear to be operational;
- Verify that the wind speed and wind direction sensors are moving freely (which is especially important during periods of freezing rain or snow); and
- Clear snow, ice, or accumulated water from surfaces of sensors.

A check list is used to document work performed during the surveillance visits and will be filed with the site visit memo (Appendix B). In the event that station repairs or modifications become necessary, the HCG project manager will dispatch HCG field personnel to accomplish the necessary work. Table B7 is a list of spare parts for this project that will be stored at the HCG Anchorage office and, in some cases, on site to minimize periods of invalid data collection. HCG staff will review data from the stations at least once every work day to check that meteorological sensors and data acquisition are functioning properly.

B6.3 Preventive Maintenance and Corrective Actions

The procedures and schedule for preventive maintenance outlined in the standard operating procedure (SOP) will be followed for this monitoring program (Appendix B). As needed, the spare parts and/or sensors will be dispatched to the monitoring station for repair or sensor replacement by qualified HCG personnel (see Section A4, Organization Chart).

Table B7. List of Meteorological Equipment Spare Parts

Meteorological Parameter	Manufacturer	Model	Spare Parts
Wind Speed	Climatronics/ RM Young	F460/ 05305AQ	Extra sensor, cups[1], propeller[1], and bearings
Wind Direction	Climatronics/ RM Young	F460/ 05305AQ	Extra sensor, vane[1], and bearings
Ambient Temperature	Met One	062-MP	Spare sensor
Delta Temperature	Met One	062-MP	Pair of matched spare sensors
Barometric Pressure	Vaisala	PT101B	Spare sensor
Relative Humidity	Vaisala	HMP45AC	Spare sensor
Solar Radiation	Li-Cor	LI200X	Spare sensor
Precipitation	ETI	NOAH II	Spare sensor and recommended parts
Evaporation	NovaLynx	255-100	Spare sensor and recommended parts

[1] Stored at HCG Anchorage office and at the monitoring site.

B7. Instrument/Equipment Calibration and Frequency

B7.1 Calibration Frequency

Sensors will be calibrated according to the manufacturers' recommendations by HCG personnel immediately prior to the project start date and on a semiannual basis thereafter. Associated calibration forms, methodology, and calibration SOP are presented in Appendix B.

B7.2 Calibration Equipment

All instruments used for calibrating meteorological sensors will be traceable to a National Institute of Standards and Technology (NIST) transfer standard. Calibration certifications will remain on file at the HCG main office. Specific calibration equipment used, NIST traceability standards, equipment certification frequency, equipment accuracy, and calibration range for each meteorological parameter measured are provided in Table B8. The specifications stated in *Quality Assurance Handbook for Air Pollution Measurement Systems* (EPA-600/R-94/038c, September 1994) and *Meteorological Monitoring Guidance for Regulatory Modeling Applications* (EPA-454/R-99-005), for the calibration parameters are referenced in Table B8 to show compliance with EPA standards.

Table B8. List and Specifications for Calibration Equipment

Meteorological Instrument	Calibration Standard	Calibration Standard Characteristics	Manufacturer Specification	Guidance Document
Wind Speed (Climatronics F460 and RM Young 05305-AQ)	**RM Young 18801 Anemometer Drive**	Range of calibration	0 to 10,000 rpm	0, 2, 5, 10 m/s
		Range of standard	0 to 10,000 rpm	Not Specified
		Accuracy of standard	1.0 rpm	Not Specified
		Calibration Frequency[1]	annually	annually[2]
		NIST traceability method	via RM Young certification	Not Specified
Wind Direction (Climatronics F460 and RM Young 05305-AQ)	**Climatronics F460/ RM Young linearity Test Fixture**	Range of calibration	0 to 360º	Not Specified
		Range of standard	0 to 360º	Not Specified
		Accuracy of standard	0.75º	Not Specified
		Calibration Frequency[1]	n/a	n/a
		NIST traceability method	n/a	n/a
Ambient Temperature and Delta T (Met One 062-MP)	**Control Company Traceable 4000 series thermometer**	Range of calibration	-20º to 400º C	-40º to 60º C
		Range of standard	-50º to 150º C	Not Specified
		Accuracy of standard	± 0.001º C	± 0.1 ºC
		Calibration Frequency[1]	annually	annually[2]
		NIST traceability method	via Control Co. certification	Not Specified
Solar Radiation (LiCor LI200X)	**Co-located Eppley PSP**	Range of calibration[3]	0 to 2000 w/m^2	Not Specified
		Spectral Response[4]	285 to 2800 nm	285 to 2800 nm
		Accuracy of standard	± 0.5 %	± 5 % of observed
		Calibration Frequency[1]	annually	annually[2]
		NIST traceability method	To world radiometric reference via calibration with Eppley Cavity Pyrheliometer	To world radiometric reference
Barometric Pressure (Vaisala PT101B)	**Co-located Pretel AltiPlus A2**	Range of calibration	Ambient condition check (ACC)	ACC
		Range of standard	728 to 1050 mb	Not specified
		Accuracy of standard	± 1 mb	0.2 %
		Calibration Frequency[1]	annually	annually[2]
		NIST traceability method	via Chinook Engineering certification to Ruska Deadweight tester	Not specified
Relative Humidity (Vaisala HMP45AC)	**Co-located Vaisala HMI41**	Range of calibration	Ambient condition check (acc)	ACC
		Range of standard	0-100% RH	Not Specified
		Accuracy of standard	± 2 % RH	± 1.5ºC [5]
		Calibration Frequency[1]	annually	annually[2]
		NIST traceability method	via Vaisala Labs certification with Hyrgo M-3 dewpoint meter	Not specified
Precipitation (ETI NOAH II)	**NovaLynx 260-2595 Tipping Bucket Rain Gauge Calibrator**	Range of calibration	24.66 mm/hr	< 25.0 mm/hr
		Range of standard	0 to 940 ml	n/a
		Accuracy of standard	n/a	Not specified
		Calibration Frequency[1]	n/a	n/a
		NIST traceability method	n/a	n/a
Evaporation (Nova Lynx 255-100)	**Graduated Cylinder**	Range of calibration	3"-9" of H_20 in gauge	Not specified
		Range of standard	n/a	Not specified
		Accuracy of standard	n/a	Not specified
		Calibration Frequency[1]	n/a	Not specified
		NIST traceability method	n/a	n/a

Note: All monitoring instrument calibrations performed every six months.

[1] Refers to calibration frequency of calibration standard/instrument.

[2] Guidance document specifies standard calibration per manufactures' specifications.

[3] Calibration range for solar radiation will be specific to the time and day of audit.

[4] Guidance document allows use of photovoltaic pyranometers when data will be used to estimate stability.

[5] Guidance document specifies values for dew point, not relative humidity.

B8. Inspection/Acceptance of Supplies and Consumables

All spare parts inventories will be kept up to date by the data manager. Each new spare part will be accepted with the same procedures mentioned in Section B6. Serial numbers for each spare sensor will be recorded by either the data manager or technicians and filed with the data manager. Upon deployment of a replacement part/sensor by site technicians, the make, model, and serial number will be recorded on a Site Visit and System Check form (see Appendix B) or an equivalent site visit memorandum. Each replacement sensor will be calibrated and a performance audit will be completed by technicians to ensure that the senor is properly functioning. The make, model, and serial number of the removed sensor, as well as replacement sensor information, will also be recorded on the performance audit form provided in Appendix B.

Consumable supplies are not expected to be necessary for this project.

B9. Non-direct Measurements

B9.1 Climate History

The Iliamna airport provides the only known comprehensive climate data available near the Pebble Project area. The Pebble Project mine area stations are located approximately 20 miles northwest of the Iliamna airport and the Pebble Port station lies approximately 50 miles to the southeast. Figure B11 shows the daily extreme and average high and low temperatures recorded at Iliamna from November 10, 1939 through 2005. The mean temperature at Iliamna ranges from 3°C (37°F) in January to 30°C (56°F) in July. The record low of -44°C (-47°F) was measured on January 22, 1947 and the record high of 33°C (91°F) was measured on June 27, 1953.

Figure B12 shows the monthly mean precipitation for Iliamna compiled from measurements collected from November 11, 1939 through 2005. Iliamna experiences the most precipitation in August and September with monthly mean precipitation values of 4.62 inches (117 mm) and 4.32 inches (110 mm), respectively. April is typically the driest month and has a monthly mean of 1.08 inches (27 mm) of precipitation.

Figure B13 shows a wind rose based on data collected by the National Weather Service from January 1, 2000 to December 31, 2004 at the Iliamna airport. Prevailing winds typically blow from the north and east. Because the Pebble Project meteorological stations are positioned at significant distances away from the airport and sit at varying elevations relative to the Iliamna airport and each other, the monitoring sites are expected to experience somewhat different meteorological conditions.

Figure B11. Iliamna Daily Extreme and Average High and Low Temperatures

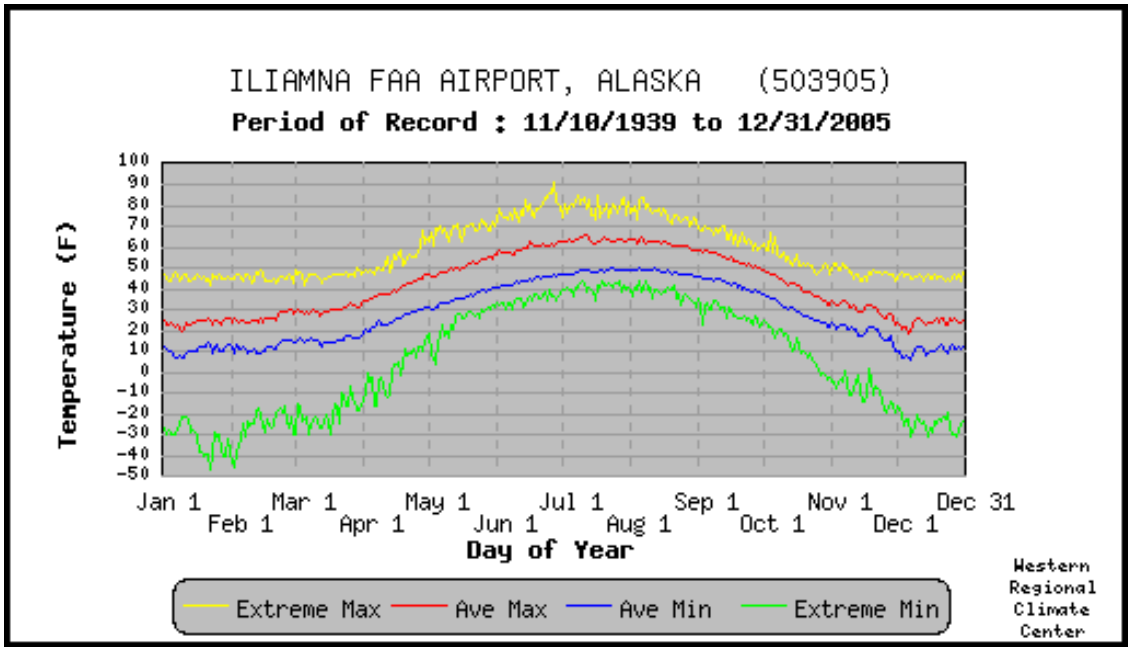

Figure B12. Iliamna Monthly Mean Precipitation

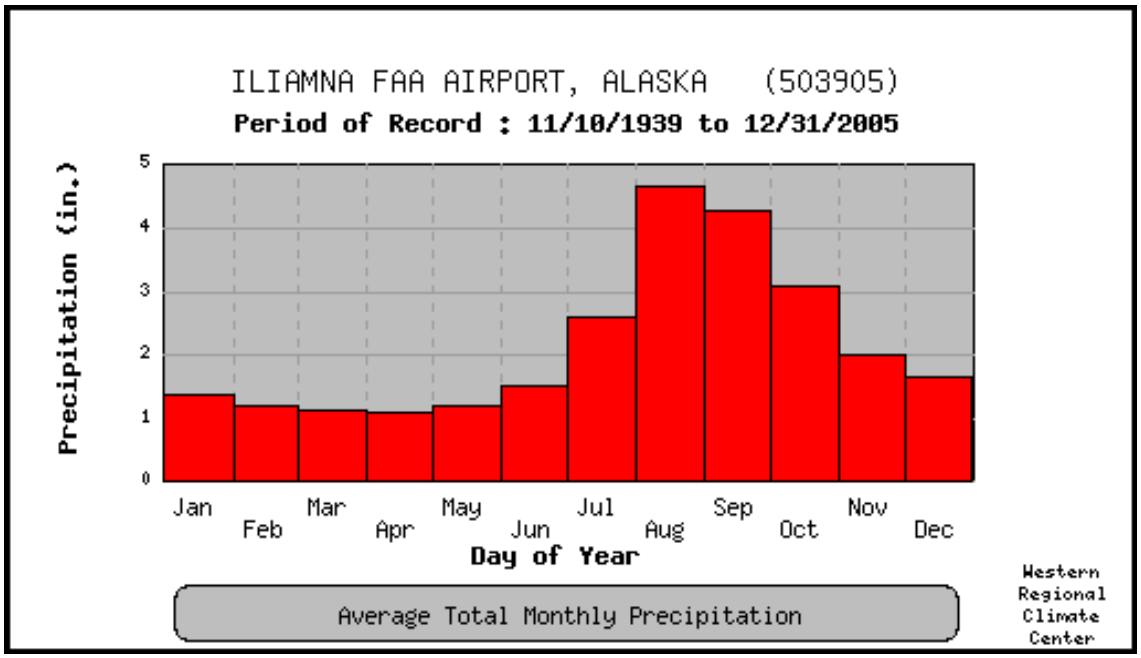

Figure B13. Iliamna Wind Rose

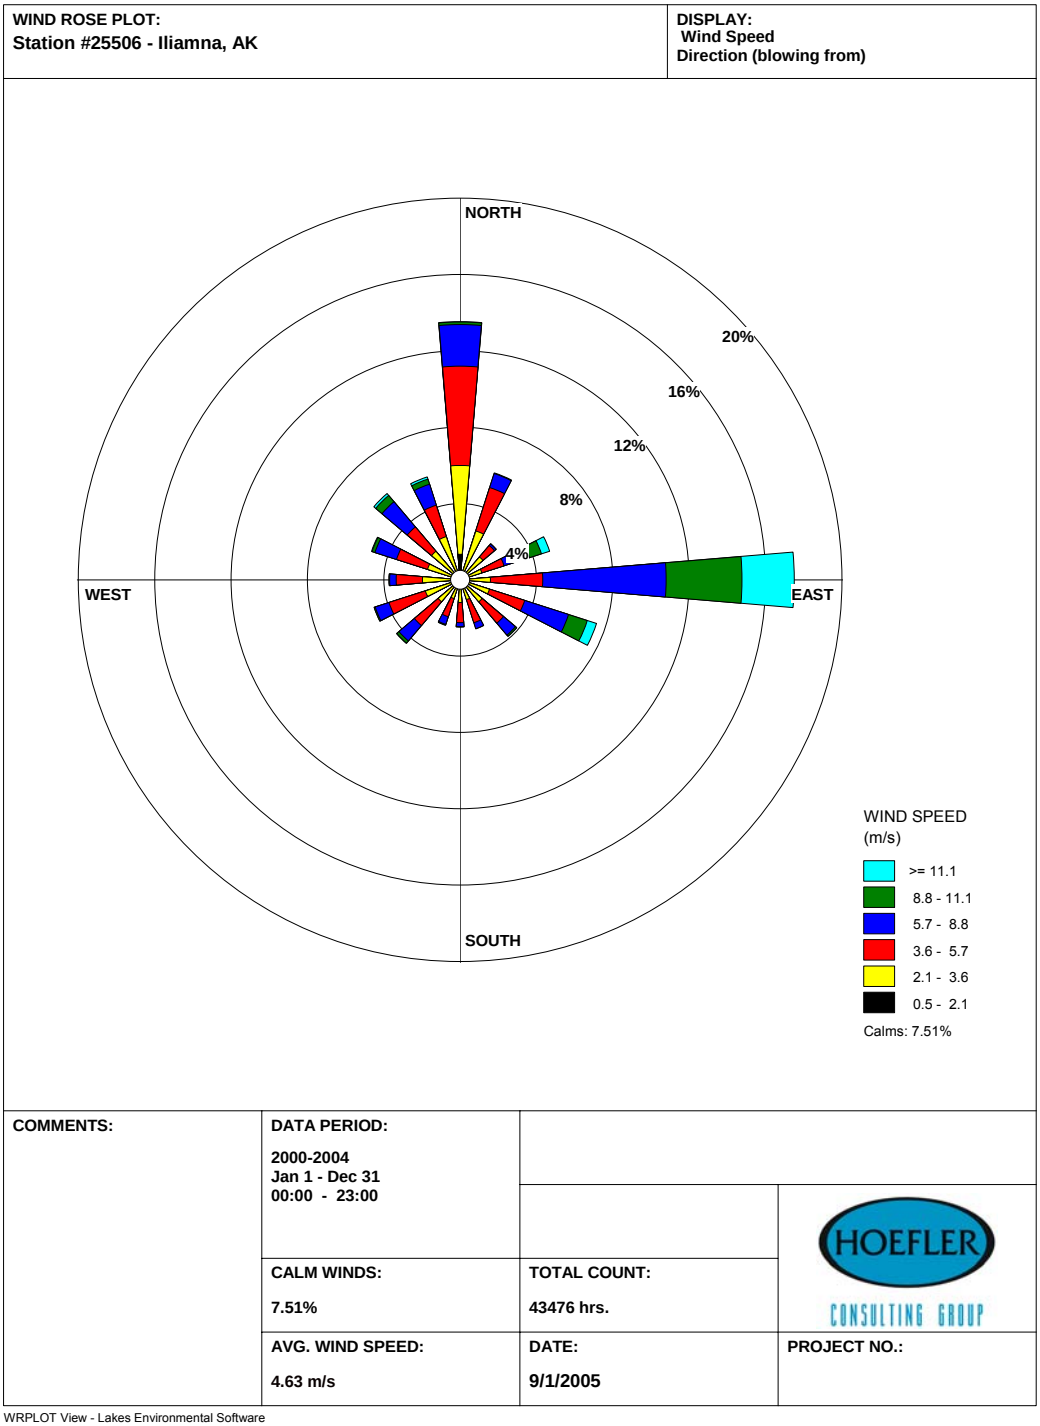
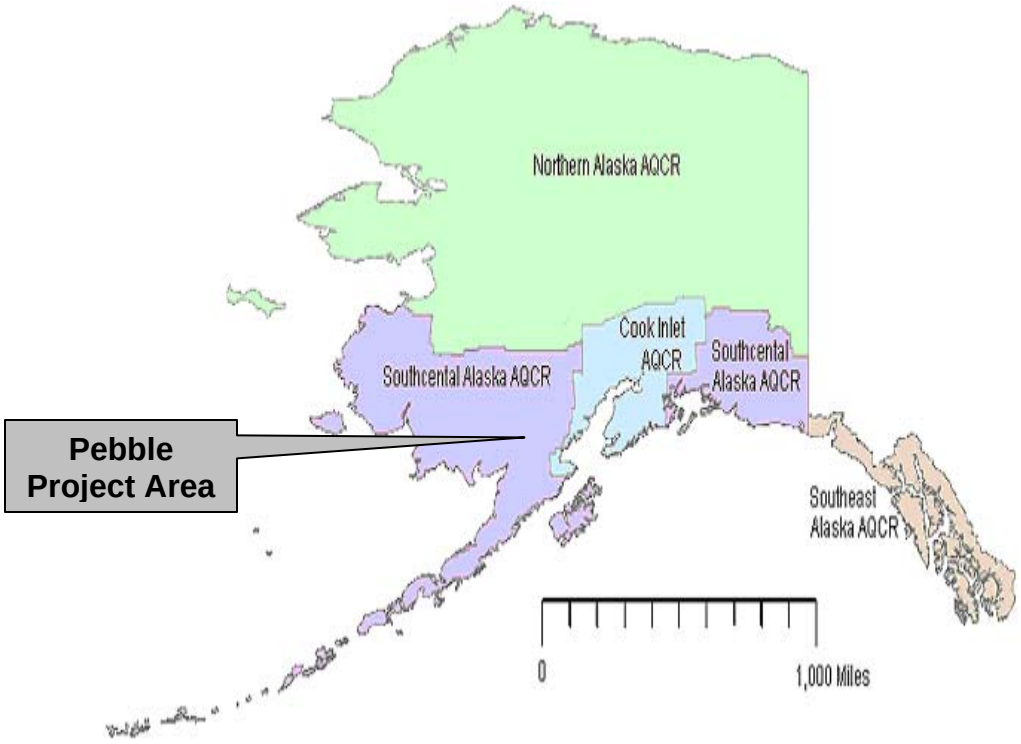


B9.2 Land Use

The Pebble Project study area is in a remote region of southwestern Alaska. The Pebble Port location lies within the boundaries of the Cook Inlet Air Quality Control Region (AQCR), as shown in Figure B14. The Pebble Project mine area lies within the boundaries of the Southcentral AQCR, as shown in Figure B14.

Figure B14. Alaska Air Quality Control Regions



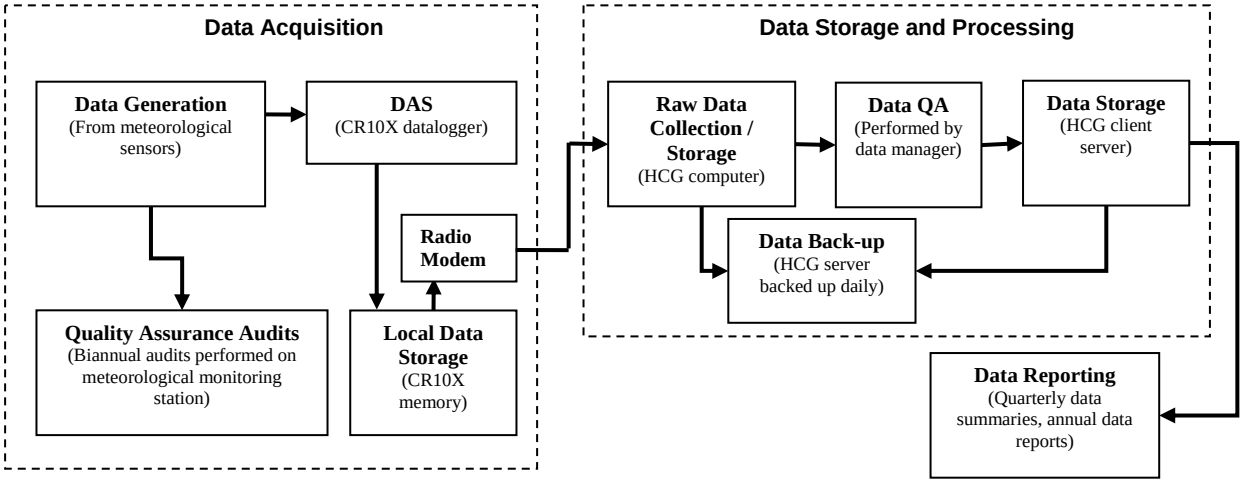
The map in Figure B15 shows the Class I areas in Alaska. The map reference to Denali National Park and Preserve is actually "Denali National Park including the Denali Wilderness but excluding the Denali National Preserve", as per 18 AAC 50.015. The Pebble Project area is within a Class II area and has been designated attainment or unclassifiable for all criteria pollutants. The Tuxedni Wilderness Area is the closest Class I area, which lies approximately fifty miles away from the proposed Pebble Port site, and ninety miles away from the Pebble Project mine area.

Figure B15. Alaska Class I Areas

B10. Data Management

The proper management of all data associated with this project is critical to assuring the quality and usability of the monitoring results. Therefore, procedures will be implemented to ensure adequate data acquisition, validation, transmission, reduction, reporting, and storage of electronic and hard copy data. Summaries of the procedures to be implemented in the field and in the laboratory for data management are provided in the following sections. Overall data processes are described in Figure B16, the Data Processes Flow Chart.

Figure B16. Data Processes Flow Chart



B10.1 Data Acquisition

Data acquisition will include the daily collection of electronic data, the generation of hand-written or typed audit and calibration records, and the compilation of previously prepared records (e.g., NIST traceability records). A Campbell Scientific CR10X datalogger will be used to collect and store the continuous meteorological data. Freewave wireless and SixNet telephone modems will be used to contact the stations remotely via a designated monitoring computer at HCG's Anchorage office. Station data will be downloaded on a daily basis. Field staff and the station auditor will generate written or typed records. These records will be kept according to the prescribed format. Additional records pertaining to this project that have been generated by other organizations will also be collected and stored at the HCG Anchorage main office as necessary.

B10.2 Data Validation

Meteorological data will be reviewed every work day by the HCG data manager or designated qualified personnel and screened using the recommended criteria in *Meteorological Monitoring Guidelines for Regulatory Modeling Applications* (EPA-454/R-99-005), Table 8-4. Site specific Microsoft Access databases and Excel spreadsheets will be used to store, review, and compare data to EPA critical criteria.

During each site visit, HCG Field Technicians will be responsible for verifying the condition of the monitoring site. All site visits will be documented by means of a site visit memo kept

with the project files. Alternately, the site visit may be documented in a designated station log book. These field notes will include the following:

- Time, date, current meteorological conditions, and personnel at the monitoring site;
- Activities completed during visit; and
- As-found and as-left observed conditions of monitoring site equipment.

The data manager or their designee will review all records received from the field. Problems or irregularities in the records will be brought to the attention of HCG Field Technicians for further clarification. If the documentation is not sufficiently defensible, the affected data will be invalidated.

B10.3 Data Transmission

Meteorological data will be collected daily by electronic transmission to the HCG Anchorage office. Original forms, check lists, and other records will be stored upon receipt at the HCG main office until the end of the monitoring period. A description of the equipment implemented in the monitoring site telemetry is included in the above section B10.1.

B10.4 Data Reduction

All electronic calculations and statistical analyses will be performed using standard software packages (e.g., MINITAB, Excel, and WRPLOT view) that can be easily verified and audited. Preliminary data reduction to hourly data averages is performed by the CR10X datalogger.

B10.5 Data Reporting

Data generated for this project will be routinely summarized and presented to NDM as described in Section C2. The data will also be submitted to ADEC for review and approval in anticipation of using the meteorological data to meet the air dispersion modeling requirements for a minor source air construction permit application.

B10.6 Data Storage

All project documentation, records, data, and reports will be maintained at HCG for a period of at least five years from the completion of the project. Electronic data on the HCG servers are backed up at least once daily and will be archived at a minimum of two separate locations.

B10.7 Data Use in Modeling

The meteorological data collected during this project will be used for air dispersion modeling using EPA approved AERMOD and CALPUFF models.

C. Assessments and Oversight

C1. Assessments and Response Actions

Data Quality Assessments will be performed on all collected data. Data reviews will be conducted by HCG staff to determine whether the data are reasonable and representative through an independent audit program. Data that are determined to be unreasonable or unrepresentative will be identified, flagged, and discussed in the data reports. The independent audit program for the Pebble Project will consist of semi-annual performance audits and annual systems audits. The audits will be conducted by HCG staff and will be independent of the staff operating the monitoring network. In addition, audits will be conducted using equipment independent of that used for instrument calibrations. The auditor will use a pre-formatted audit form and follow established audit standard operating procedures provided in Appendix B.

C1.1 Performance Audits

Performance audits of the meteorological sensors will be conducted within thirty days of the project start, semi-annually thereafter, and within thirty days of project completion. Performance audits for meteorological sensors will be conducted by collocating independent meteorological sensors with those being used for the monitoring program. The audit sensors will be provided by the station auditor. Performance audits will serve the monitoring program with a measure of quality assurance for meteorological sensors and a means to produce a defensible data set. The performance audits will be conducted in accordance with the procedures outlined in *Meteorological Monitoring Guidance for Regulatory Modeling Applications,* Section 8 (EPA-454/R-99-005). The QA auditor will conduct the performance audits. An outline for the audit equipment and procedures on all meteorological sensors used for this study is listed in Table C1.

C1.2 Systems Audits

In the *Meteorological Monitoring Guidance for Regulatory Modeling Applications,* Section 8 (EPA-454/R-99-005), and *Ambient Monitoring Guidelines for Prevention of Significant Deterioration (PSD)*, Section 7 (EPA-450/4-87-007), EPA recommends that a systems audit be conducted to assess compliance with established regulations governing the collection, analysis, validation, and reporting of meteorological monitoring for PSD. A systems audit is an independent review of program procedures and files to assess conformance to established plans, SOPs, and protocols (see Appendix B). Systems audits for this project will be conducted no later than 30 days after project startup and annually thereafter. The systems audit will evaluate the complete measurement system from data collection through data reporting. The evaluation will also include all off-site data handling and evaluate the management process.

The systems audit is also an on-site qualitative review of the operational procedures of the monitoring program. The audit will ensure that all procedures for the monitoring program (field operations, data reporting, and data management) are being followed and that the data being collected meet the DQOs for the program as described in Section A7. Items reviewed during the systems audit include:

- Quality assurance procedures and documentation;
- Station installation and operation procedures;
- Calibration procedures and documentation for monitoring equipment;
- Documentation of log books and data sheets;
- Completion and documentation of on-site quality assurance procedures; and
- Review of prepared data sets.

After completion of the audit, a debriefing will be conducted with the participants to discuss preliminary audit results. The results of this audit will then be formally compiled in an audit report with observations of strengths and deficiencies, and recommendations for improvements. The audit report will be submitted by the auditor to the NDM and HCG project managers within 30 days. The HCG project manager will ensure that any necessary corrective actions are implemented in a timely manner. Audit forms and further information on system audits are provided in Appendix B.

Table C1. List of Performance Audit Equipment and Procedures

Meteorological Variable	Make/Model	Audit Method	NIST Traceable Audit Tool Used	Frequency of Audit	Procedure
Wind Speed	Climatronics F460/ RM Young 05305-AQ	Synchronous motor comparison	RM Young 18801 Anemometer Drive	Semiannually	See SOP in Appendix B
Wind Direction	Climatronics F460/ RM Young 05305-AQ	Fixed linearity test	Climatronics F460/ RM Young 05305 linearity test fixture	Semiannually	See SOP in Appendix B
Ambient Temperature and Delta T	Met One 062-MP	Co-located temperature immersion bath comparison	Control Company Traceable 4000 series thermometer	Semiannually	See SOP in Appendix B
Solar Radiation	Li-Cor LI200SZ	Co-located sensor comparison	Eppley Labs PSP	Semiannually	See SOP in Appendix B
Barometric Pressure	Vaisala PT101B	Co-located sensor comparison	Pretel Altiplus A2	Semiannually	See SOP in Appendix B
Relative Humidity	Vaisala HMP45ASP	Co-located sensor comparison	Vaisala HMI41	Semiannually	See SOP in Appendix B
Precipitation	ETI NOAH II	Volumetric drip comparison	Nova Lynx 260-2595 Tipping Bucket Rain Gauge Calibrator	Semiannually	See SOP in Appendix B
Evaporation	Nova Lynx 255-100	Water height comparison	Precision Tape Measure	Semiannually	See SOP in Appendix B

C1.3 Corrective Actions

All deficiencies identified during audits and site visits will be recorded and reported to the project manger no later than seven working days of discovery. Corrective actions to rectify deficiencies will be addressed and documented in a Corrective Action Form (see Appendix

B) and on the audit reports. Corrective actions will also be discussed in the annual data reports.

Based on the review of the systems audit, it may be necessary to revise this QAPP. The QAPP revisions will address any project deficiencies stated in the system audit. The project manager and permitting manager will make any necessary changes and the revised QAPP will be submitted to ADEC for approval.

C1.4 QAPP Revisions

After submittal and approval, any needed revisions of the NDM QAPP will be brought to the attention of the HCG project manager. Appropriate actions will be taken on any needed revisions and a revised version of the QAPP will be submitted to ADEC and NDM.

C2. Reports to Management

In accordance with ADEC reporting guidelines, quarterly data summaries and annual data reports will be prepared by HCG and provided to NDM and ADEC. Two separate annual data reports will be prepared, one for each monitoring year. All quarterly data summaries and annual data reports will be submitted to ADEC after ADEC has received the QAPP.

Quarterly data summaries will be prepared by HCG in accordance with the format described in *PSD Ambient Air Quality & Meteorological Monitoring Quarterly Data Summary Format* (ADEC, March 2005) and provided to NDM and ADEC within 30 days after the completion of each calendar quarter.

The final annual data report will conform to format requirements in *PSD Quality Ambient Air Quality & Meteorological Monitoring Annual Data Report Format* (ADEC, March 2005) and be provided to NDM and ADEC within 90 days after completion of the monitoring period. This report will summarize the monitoring data for the entire period, including monthly, quarterly, and annual averages for all measured parameters. This report will also include the following:

- Data capture statistics for the meteorological sensors;
- Explanations for any missing or flagged data;
- Summaries of maintenance activities;
- Results of calibrations and audits;
- Raw data and calculations used for calibrations and audits; and
- Copies of site visit notes.

D. Data Validation and Usability

D1. Data Review, Validation, and Verification Requirements

D1.1 Data Review

As meteorological data are periodically received over the monitoring year, the data manager will review the incoming data and make comparisons to the standards discussed in Section B10.2 of this document. During each quarter, the data will be reviewed again by a certified staff meteorologist to ensure that the data are complete, accurate, and representative and that erroneous data have been removed in preparation for the final data report. All other documentation pertaining to this monitoring project (e.g., trip reports, audit and calibration data sheets) will be reviewed upon receipt to ensure that all forms are completed prior to acceptance and for further use in this project. Table D1 summarizes the data review for this monitoring project.

Table D1. Data Review List for the Pebble Project

Type of Data Generated	Method for Acceptance	Data Review	Review Frequency	Person Responsible for Data Review	Project Specific Calculations
Raw Data	Calibrated DAS	n/a	Every Work Day	Project and data manager	Delta T and Wind Sigma
QA Reviewed Data	Data Review	MS Excel and Access Databases screening for EPA PSD criteria	Each Work Day	Project and data manager	n/a
Quarterly Data Summary	HCG permitting manger review	MS Excel and Access Databases screening for EPA PSD criteria	Quarterly	Project and data manager	Quarterly data capture statistics
Annual Data Report	HCG permitting manger review	MS Excel and Access Databases screening for EPA PSD criteria	Annual	Project and data manager	Quarterly and annual data capture statistics

D1.2 Data Calculations

Meteorological data collected for this project will be used for air dispersion modeling. Atmospheric stability, commonly determined using the solar radiation-delta temperature (SRDT) method, will be calculated using the EPA approved AIRMET Program.

D2. Validation and Verification Methods

Data validation refers to the review process in which data are screened for errors and anomalies. All data for this meteorological monitoring program will be validated only after being screened by the criteria in *Meteorological Monitoring Guidance for Regulatory Modeling Applications,* Table 8-4 (EPA-454/R-99-005).

Semiannual audits and calibrations will be performed on the station to ensure that all sensors are operating within the tolerances suggested by the manufacturer and the EPA. During each site visit, the station operator will be responsible for recording any anomalies or significant events and bringing them to the attention of the data manager. Copies of the site visit memos will also be provided to the data manager.

For this project two types of wind sensors are being used to provide redundant data. The RM Young 05305-AQ wind sensor uses a combined propeller anemometer and vane assembly, and the Climatronics F-460 wind sensor uses a three cup-type anemometer with a separate vane-style wind direction sensor. The RM Young sensor can be somewhat less susceptible to rime ice build-up and is therefore used as a back-up wind measurement sensor. In cases when the Climatronics wind sensor data fails to meet the DQO goal of 90% quarterly data capture, the back-up RM Young wind data will be used, if deemed necessary and applicable. Both the primary and back-up wind sensors will have the same level of quality assurance checks as outlined in Sections B5 and B6.

The data manager will review data at least once each work day to check for irregularities in all measured parameters. Any suspicious data will be investigated.

D3. Reconciliation with User Requirements

The objective of this monitoring program is to collect surface meteorological data needed for engineering design and environmental purposes, including water balance studies, and for the preparation of the air quality construction permit applications for the mine, road, and port sites. Although the mine, road, and port facilities may not require a PSD permit, PSD-quality data will be collected to support the required computer-based dispersion modeling. HCG will conduct an annual or final review at the completion of the monitoring project and report the results obtained during the reporting period. These reports will be compared with the established DQOs to ensure that the scope of the project has been met.

The reconciliation of data for this project will be determined by the data validation and verification process as discussed in Section D2 of this document and based upon the five step Data Quality Assessment (DQA) plan recommended in *Guidance for Data Quality Assessments* (EPA QA/G-9):

1. A review of the DQOs and sampling design will be conducted by the permitting manager to assure meteorological outputs from this program are still applicable. If DQOs have not been developed, the permit manager will specify DQOs before evaluating the data. The permitting manager will also review the sampling design and data collection documentation for consistency with the DQOs.
2. A Preliminary Data Review will be conducted by the permitting manager. The manager will review QA reports, calculate basic statistics, and generate graphs of the data. This information will be used to determine data structure and identify patterns, relationships, or potential anomalies.
3. A statistical test will be selected that is most appropriate for summarizing and analyzing the data, based on the review of the DQOs, the sampling design, and the preliminary data review. The permitting manager will identify the key underlying assumptions that must hold for the statistical procedures to be valid.
4. Given the actual data and other information about the study, the permitting manager will evaluate whether identified assumptions will hold, or whether departures are acceptable.
5. Conclusions from the statistical calculations will be evaluated to determine if the monitoring design and its created data meet the required permits for the statistical test. This determination will be documented, as well as the inferences drawn as a result of these calculations. If the design is to be used again, an evaluation will be made on the performance of the sampling design.

If the preliminary data review reveals that data sets are inconsistent with the DQOs, or the underlying assumptions of the statistical test are not supported by the data and fail to meet the criteria/objectives of this monitoring project, then the permit manager and project manager will reconsider the project design as described in this QAPP.

APPENDIX B
STANDARD OPERATION PROCEDURES AND FORMS

APPENDIX B1
STANDARD OPERATION PROCEDURES

Calibration Procedure for Climatronics F460 Wind Speed and Wind Direction Sensors

1.0 Introduction

Calibration of Climatronics F460 type wind speed and wind direction sensors (hereafter referred to as F460 sensors) are calibrated at the factory before receipt. Therefore, the calibration schedule for an F460 sensor requires an initial calibration check, and calibrations every 6 months. Calibrations are also required immediately after any repair, rewiring, adjustment, or replacement of the sensor or any sensor components.

The calibration is comprised of the determination of sensor responses to known input values, maintenance and adjustment of the sensors responses if warranted, and the documentation of all adjustments and responses.

Items required for the calibration of an F460 are as follows:

1. RM Young 18801 (or similar model) anemometer drive
2. Climatronics F460 linearity test fixture
3. PC or similar display module
4. Tripod mounted, survey grade compass and/ or pre-determined bearings to landmarks.
5. F460 manual

The calibration will begin by filling out the first part of the wind speed and wind direction calibration forms, noting the time, date, calibrator, and any witnesses.

1.1 System Inspection

Before determining the initial response of a F460 inspect the cable, cups, vane, and bearings for damage, open the outer cuff of the sensor and look for condensation inside. Note these observations on the Wind Speed Calibration Form.

2.0 Wind Speed Calibration Procedures

2.1 Pre-adjustment System checks

A system response check is performed by the use of an RM Young 18801 (or similar model) anemometer drive. The cups are removed from the sensor shaft and the anemometer drive is attached. The sensor is then challenged at the speeds specified on the Wind Speed Calibration Form. The speeds measured by the datalogger for each specific revolution per minute (rpm) are compared to the calculated values. The equation for calculating wind speed as a function of anemometer drive rpm is given on the Wind Speed Calibration Form.

2.2 Maintenance and Adjustments

At this point the technician should review the performance of the sensor and determine what adjustments are required, if any. All basic maintenance should be performed before any serious adjustment of the sensor, or determination of a new multiplier and/or offset in the datalogger programming. All maintenance and adjustments should follow the guidelines presented by the manufacturer in the F460 instrument manual.

2.3 Post-Adjustment Checks

If any maintenance or adjustments were performed, the steps listed in Section 2.1 of this procedure should be repeated and recorded on the Wind Speed Calibration Form. Results of the post adjustment checks should be closely evaluated. If the output values do not closely match the expected values, perform troubleshooting, maintenance, and adjustments as needed to correct the sensor response. If the sensor is deemed un-repairable by the technician, it should be replaced as soon as possible from the stock of back-up sensors for the monitoring project.

3.0 Wind Direction Calibration Procedures

3.1 Sensor Orientation

After the system is inspected, a check of the wind vane orientation is performed. The two methods for an orientation check of the wind vane are as follows:

<u>Compass</u>

1. Determine declination for the area using a Geomag type program with the most recent models of the earth's magnetic field.
2. Use a clamp fashioned from a band clamp and rubber tubing to fix the wind vane in various directions. In medium to high winds a vane with the "tail" removed may have to be used as to not damage the wind vane.
3. Using a tripod mounted and leveled, survey grade compass align the compass so that it sights directly at the tail of the wind vane.
4. Obtain readings in each of the four quadrants of the compass.
5. Record the readings from the datalogger and the compass on the Wind Direction calibration form.

<u>Landmark</u>

1. Obtain a GPS point directly under the wind direction sensor.
2. Using a mapping program (eg: TOPO!, allTOPO, or similar) with USGS datasets as its base files, obtain bearings to nearby defined landmarks.
3. Clamp and site the vane tail at the appropriate landmark and record the reading from the datalogger.

3.2 System Linearity Check

Using a Climatronics F460 linearity test fixture test the sensor at 30° intervals. Record the readings from the datalogger at each interval on the Wind Direction Calibration Form and compare to the expected values. If possible, check the linearity of the instrument by fitting a curve and checking the slope, and intercept of the Y = X line. Check to see if the accuracy of the instrument is no more than ± 5° (accuracy) and ≤ 3° mean absolute error (linearity). Mean absolute error is calculated by the the following equation: equation.

$$\sum \frac{|X|}{n}$$

Were *X* is the precision of the instrument at any given degree, and *n*, is the number of measurements taken.

3.3 Maintenance and Adjustment

At this point the technician should review the performance of the sensor and determine what adjustments are required, if any. All basic maintenance should be performed before any serious adjustment of the sensor, or determination of a new multiplier and/ or offset in the datalogger programming. All maintenance and adjustments should follow the guidelines presented by the manufacturer in the F460 instrument manual. If the orientation was incorrect, the alignment of the cross arm will need to be adjusted following the linearity check.

3.4 Post Adjustment Checks

After all maintenance and adjustments have been made, the steps listed in Sections 3.2 and 3.1 of this document should be repeated, respectively. All results should be recorded On the Wind Direction Calibration Form. Results of the post adjustment checks should be evaluated. If the output values do not closely match the expected values, perform troubleshooting, maintenance, and adjustments as needed to correct the sensor response. If the sensor is deemed un-repairable by the technician, it should be replaced as soon as possible from the stock of back-up sensors for the monitoring project.

4.0 Conclusion

At the conclusion of the calibration, complete all calibration forms noting any adjustments made, maintenance performed, and corrective actions taken, if any. Note the specific time which the calibrations for the wind speed and direction sensors began and ended. Sign and date the calibration form under any comments made.

Audit Procedure for Wind Speed and Wind Direction Sensors

1.0 Wind Speed

The required instruments to complete a wind speed audit are a torque watch, and anemometer drive.

The audit procedure is as follows: A system response check is performed by the use of an RM Young 18801 (or similar model) anemometer drive. The cups are removed from the sensor shaft and the anemometer drive is attached. The sensor is then challenged at the speeds specified on the Wind Speed Audit Form. The speeds measured by the datalogger for each specific rpm are compared to the calculated values. The equation for calculating wind speed as a function of anemometer drive rpm is given on the Wind Speed Audit Form. The absolute difference from expected values is then calculated to see if the values agree within ±0.5 mph or 5% of observed.

The starting torque should be measured with a torque watch, and recorded on the Wind Speed Audit Form. If the sensor starting torque is above 0.0049 oz-in the bearings may need to be cleaned, oiled, or replaced.

2.0 Wind Direction

The process for auditing a wind direction sensor is described below:

<u>Compass</u>

1. Determine declination for the area using a Geomag type program with the most recent models of the earth's magnetic field.
2. Use a clamp fashioned from a band clamp and rubber tubing to fix the wind vane in various directions. In medium to high winds a vane with the "tail" removed may have to be used as to not damage the wind vane.
3. Using a tripod mounted and leveled, survey grade compass align the compass so that it sights directly at the tail of the wind vane.
4. Obtain readings in each of the four quadrants of the compass.
5. Record the readings from the datalogger and the compass on the Wind Direction calibration form.

<u>Landmark</u>

4. Obtain a GPS point directly under the wind direction sensor.
5. Using a mapping program (eg: TOPO!, allTOPO, or similar) with USGS datasets as its base files, obtain bearings to nearby defined landmarks.
6. Clamp and site the vane tail at the appropriate landmark and record the reading from the datalogger.

2.1 System Linearity Check

Using a linearity test fixture appropriate for the sensor, test the sensor at 30° intervals. Record the readings from the datalogger at each interval on the Wind Direction Audit Form and compare to the expected values. If possible, check the linearity of the instrument by fitting a curve and checking the slope, and intercept of the Y = X line. Check to see if the accuracy of the instrument is no more than ± 5° (accuracy) and ≤ 3° mean absolute error (linearity). Mean absolute error is calculated by the equation 1.0.

$$\sum \frac{|X|}{n}$$

Were *X* is the precision of the instrument at any given degree, and *n*, is the number of measurements taken.

Calibration Procedure for MetOne 062 Temperature Sensors

1.0 Introduction

MetOne 062 temperature sensors (hereafter referred to as temperature sensors) are calibrated at the factory before receipt. Therefore, the calibration schedule for a temperature sensor requires an initial calibration check, and calibrations every six months. Calibrations are also required immediately after any repair, rewiring, adjustment, or replacement of the sensor or any sensor components.

Equipment required for temperature sensor calibration is as follows:

1. Calibrated, certified, NIST traceable thermometer.
2. Thermal mass unit and or ice, warm, and hot water bath.
3. PC or similar display module.
4. MetOne 062 manual

The calibration should start by completing the top of the Temperature Sensor Calibrations Form.

1.1 System Inspection

Before determining the initial response of the temperature measurement system, inspect the signal cable and sensor for signs of damage and wear. Note these observations in the Temperature Sensor Calibrations Form.

2.0 Pre-adjustment Calibration Procedures

2.1 System Response Check

The system response check is performed by comparing the sensor response with that of a calibrated NIST traceable thermometer for at least three different temperatures. The ideal temperatures to compare the sensors at are cold, warm , and hot. The cold, warm, and hot temperatures should be about 0˚C, 15-25˚C, and 30-40˚C, respectively. These temperatures can be obtained through the use of three small insulated thermoses. An ice bath should be used for the cold temperature range. For the warm and hot temperatures warm and hot water should be used. The thermometer and temperature sensor should be collocated as closely as possible by taping the sensors together. After allowing time for the temperature readings to stabilize, the technician will record the calibration and datalogger values on the Temperature Sensor Calibration Form. If possible, check the linearity of the instrument by fitting a curve and checking the slope, and intercept of the Y = X line. Check to see if the accuracy of the instrument is no more than ± 0.5° (accuracy) and no more than ± 0.1˚ for temperature difference between matched sensors in a delta temperature measurement system. Mean absolute error is

calculated by the equation 1.0. Were *X* is the precision of the instrument at any given degree, and *n*, is the number of measurements taken.

$$\sum \frac{|X|}{n}$$

3.0 Maintenance and Adjustments

After performing all system inspections and calibration checks, the results should be reviewed to determine what maintenance and adjustments are needed, if any. Maintenance procedures should follow the manufactures recommendations in the manual provided by the manufacturer. Since a true calibration of the sensor cannot be performed unless the sensor is checked across its full range, a sensor not conforming to the calibrated NIST thermometer will most likely need to be replaced and sent back to the factory for a true calibration.

4.0 Post-adjustment Checks

If maintenance or adjustments were made, the steps listed in Section 2.0 should be repeated and the results recorded in the Temperature Sensor Calibration Form. If the outputs do not agree within the specified limits troubleshooting, maintenance, and adjustments should be performed and noted.

5.0 Conclusion

When the instrument provides the proper response to the expected calibration values, complete the calibration form noting any adjustments, maintenance or repairs made. Sign and date the calibration form underneath any notes made in the comments section.

Audit Procedure for Temperature Sensors

The temperature sensors should be removed from the aspirators and checked at three temperature points. The system response check is performed by comparing the sensor response with that of a calibrated NIST traceable thermometer for at least three different temperatures.

The ideal temperatures to compare the sensors at are cold, warm, and hot. The cold, warm, and hot temperatures should be about 0˚C, 15-25˚C, and 30-40˚C, respectively. These temperatures can be obtained through the use of three small insulated thermoses. An ice bath should be used for the cold temperature range. For the warm and hot temperatures warm and hot water should be used. The thermometer and temperature sensors should be collocated as closely as possible by taping the sensors together. Agitate each thermos to equilibrate the medium and remove any local temperature gradients, then record the audit sensor and datalogger values on the Temperature Sensor Audit Form.

The auditor should then compare all values recorded for the temperature sensors to the standards listed on the Temperature Sensor Audit Form. The standard for temperature sensors is ±0.5˚ of observed, and ±0.1˚ for temperature difference between matched sensors in a delta temperature measurement system.

Field Calibration Check for a Li-Cor LI200X Pyranometer

1.0 Introduction

LiCor LI200X pyranometers (hereafter referred to as pyranometers) are calibrated at the factory before receipt. Therefore, the calibration schedule for a pyranometer requires an initial calibration check, and calibrations every 6 months. Calibrations are also required immediately after any repair, rewiring, adjustment, or replacement of the sensor or any sensor components.

True calibration of a pyranometer is only accomplished in full mid-summer sun, on a perfectly clear day. This calibration should also last 2 full diurnal cycles. Since these conditions are rarely possible to meet in Alaska calibration field checks rather than true calibrations of pyranometers are performed.

A field calibration check is comprised of the comparison of the pre-adjustment responses to the responses obtained from a collocated, calibrated NIST traceable pyranometer, adjusting or performing needed maintenance on the pyranometer, and documentation of all collected data and adjustments made.

Equipment required for calibration is as follows:

1. Calibrated NIST traceable pyranometer.
2. Datalogger capable of the same scan and averaging frequency as the datalogger being used on-site.
3. All associated instrument manuals.

The calibration should be started by completing the top of the Solar Radiation Sensor Calibration Form.

1.1 System Inspection

Before determining the initial response of the solar radiation system, inspect the signal cable and pyranometer. Check the cable for signs of wear. Check that the pyranometer is level and free of dust. Record these findings in the Solar Radiation Sensor Calibration Form.

2.0 Pre-adjustment Systems Check

This check requires that the solar radiation sensor is in it's normal operating mode. The first part of the check consists of totally covering the sensor to exclude all light. Observe and record the output from the datalogger (which should be approximately zero) in the Solar Radiation Sensor Calibration Form. Next check the ambient light condition output for the sensor and calibration sensor. Record these values in the Solar Radiation Sensor Calibration Form.

Pre-adjustment Collocated Transfer Standard (CTS) Check

Set-up and level the CTS as near as practical to the site pyranometer. Record the concurrent values for the site and CTS pyranometer. Ideally, the CTS should be collecting data for the entire time the technician is on-site. These data should be collected at the same scan rate, and averaged at the same interval as the site pyranometer. Ideally a full diurnal cycle of concurrent readings from the site pyranometer and CTS should be taken.

In practice, the calibration technicians time on-site is limited due to the remoteness and access of monitoring sites in Alaska. Therefore, at least four averaging periods of the site and CTS should be used. That is, if the site datalogger is set to record hourly averages of solar radiation data, four hours of data should be taken form the site datalogger and the CTS. Record the solar radiation data, averaging interval, and all other pertinent information in the Solar Radiation Sensor Calibration Form. If possible check the linearity of the instrument by fitting a curve and checking the slope, intercept, and R^2 value of the Y = X line.

3.0 Maintenance and Adjustments

At this point in the field calibration check the technician should review the results of the system inspection, system check, and CTS check to determine if the sensor is operating within its acceptable limits, and establish what maintenance and adjustments are required, if any. Maintenance procedures should follow the manufactures recommendations in the manual provided by the manufacturer. Any maintenance and adjustments performed should be noted in the Solar Radiation Sensor Calibration Form.

4.0 Post-adjustment Checks

If any maintenance or adjustments were performed, the steps listed in Sections 3.0 and 4.0 of this procedure should be repeated and all data noted in the Solar Radiation Sensor Calibration Form. The results of the post-adjustment checks should be evaluated and noted. If the results do not agree within the specified limits troubleshooting, maintenance, and adjustments should be performed and noted. If the site pyranometer cannot be calibrated properly the unit may have to be replaced and sent back to the factory for repair.

5.0 Conclusion

Upon completion of the field calibration check, the Solar Radiation Sensor Calibration Form should be completed. Any adjustments, maintenance or repairs made should be noted. Sign and date the calibration form underneath any notes made in the comments section.

Solar Radiation Sensor Audit Procedure

Performance audits of a solar radiation system require a separate datalogger and a calibrated, NIST traceable pyranometer to serve as a collocated transfer standard (CTS). Procedure for the solar radiation system audit is as follows:

1. Set-up and level the CTS as near as practical to the site pyranometer.

2. Fill in the information of the top portion of the Solar Radiation Audit Form.

3. Record concurrent values for the site and CTS pyranometers for at least four of the site averaging intervals (generally 4 hours).

Ideally a full diurnal cycle of concurrent readings from the site pyranometer and CTS should be taken. However, In general practice the auditors time on-site is limited due to the remoteness and access of monitoring sites in Alaska. Therefore, at least four averaging periods of the site and CTS should be used. That is, if the site datalogger is set to record hourly averages of solar radiation data, four hours of data should be taken form the site datalogger and the CTS. Record the solar radiation data, averaging interval, scan rate, and all other pertinent information in the Solar Radiation Sensor Audit Form.

Calculated the percent difference according to the following equation and record the results in the Solar Radiation Sensor Audit Form.

$$\textit{Percent Difference} = \frac{\textit{(Observed value) - (Audit Value)}}{\textit{(Audit Value)}}$$

If possible check the linearity of the instrument, as compared to the CTS by fitting a curve and checking the slope, and intercept, of the Y = X line. To pass the audit the measures values should be within ±5% of observed (slope) and ±10 Wm^{-2} (intercept).

Calibration Procedure for Vaisala HMP- 45 Type Relative Humidity Sensors

1.0 Introduction

Vaisala HMP-45 type relative humidity sensors (hereafter referred to as relative humidity sensors) are calibrated at the factory before receipt. Therefore, the calibration schedule for a relative humidity sensor requires an initial calibration check, and calibrations every 6 months. Calibrations are also required immediately after any repair, rewiring, adjustment, or replacement of the sensor or any sensor components.

Equipment required for relative humidity sensor calibration is as follows:

1. Calibrated, certified, NIST traceable relative humidity sensor.
2. PC or similar display module.
3. Vaisala HMP-45 type sensor manual

The calibration should be started by completing the top of the Relative Humidity Sensor Calibrations Form.

1.1 System Inspection

Before determining the initial response of the relative humidity measurement system, inspect the signal cable and sensor for signs of damage and wear. Open the sensor cover to look for signs of water condensation on the circuit board. Note these observations in the Relative Humidity Sensor Calibrations Form.

2.0 Pre-Adjustment Sensor and System Check

The system and sensor check of a relative humidity sensor is performed by comparing the sensor response with that of a calibrated NIST traceable relative humidity sensor such as a Vaisala HMI-41, to serve as a collocated transfer standard (CTS). Collocate the CTS as near to the site remative humidity sensor as possible. For aspirated temperature measurements, the sensor should be collocated inside, or just outside the bottom of the aspirator to receive the same amount of airflow and solar shielding as the site relative humidity senor. Five concurrent, instantaneous readings should be recorded, at least minute apart. Record these values on the Relative Humidity Sensor Calibrations Form.

Next calculate the absolute percent difference for each values and record the results in the Relative Humidity Sensor Calibrations Form. These instantaneous values should agree with the values from the CTS within ±5%.

Calculate the dew point temperature for each of the five points taken. Dew point temperature or T_d should be calculated according to the following equation:

Note: this equation is only valid for the following conditions:

0 °C < T < 60 °C
0.01 < RH < 1.0
0 °C < T_d < 50 °C

Where:

T = temperature in degrees Celsius
RH = is the relative humidity as a fraction (not percent)
T_d = the dew point temperature to be calculated

The formula is:

$$T_d = \frac{b\,\gamma(T, RH)}{a - \gamma(T, RH)}$$

where

$$\gamma(T, RH) = \frac{a\,T}{b + T} + \ln RH$$

and

a = 17.27
b = 237.7 °C

The recommended system accuracy for dew point temperature is ±1.5°C of observed

3.0 Maintenance and Adjustments

After performing all system inspections and calibration checks the results should be reviewed to determine what maintenance and adjustments are needed, if any. Maintenance procedures should follow the manufactures recommendations in the manual provided by the manufacturer. Since a true field calibration of the sensor can rarely be performed any sensor not conforming to the calibrated NIST relative humidity sensor will most likely need to be replaced and sent back to the factory for a true calibration.

4.0 Post-adjustment Checks

If maintenance or adjustments were made, the steps listed in Section 2.0 of this document should be repeated and the results recorded in the Relative Humidity Sensor Calibrations Form. If the outputs do not agree within the specified limits troubleshooting, maintenance, and adjustments should be performed and noted.

5.0 Conclusion

When the instrument provides the proper response to the expected calibration values, complete the calibration form noting any adjustments, maintenance or repairs made. Sign and date the calibration form underneath any notes made in the comments section.

Relative Humidity Sensor Audit Procedure

Equipment needed for a relative humidity sensor audit includes a calibrated, NIST traceable, Vaisala HMI-41 or similar type relative humidity and temperature probe. This probe will serve as a collocated transfer standard (CTS).

The process for relative humidity as dew point audit procedure is as follows:

Collocate a calibrated NIST traceable relative humidity sensor such as a Vaisala HMI-41. Collocate the CTS as near to the site relative humidity sensor as possible. For aspirated temperature measurements, the sensor should be collocated inside, or just outside the bottom of the aspirator to receive the same amount of airflow and solar shielding as the site relative humidity sensor.

After the CTS has been given ample time to equilibrate five concurrent, instantaneous readings should be recorded, at least minute apart. Record these values on the Relative Humidity Sensor Audit Form.

Calculate the dew point temperature for each of the five points taken. Dew point temperature or T_d should be calculated according to the following equation:

Note: this equation is only valid for the following conditions:

0 °C < T < 60 °C
0.01 < RH < 1.0
0 °C < T_d < 50 °C

Where:

T = temperature in degrees Celsius
RH = is the relative humidity as a fraction (not percent)
T_d = the dew point temperature to be calculated

The formula is:

$$T_d = \frac{b\,\gamma(T, RH)}{a - \gamma(T, RH)}$$

where

$$\gamma(T, RH) = \frac{a\,T}{b + T} + \ln RH$$

and

a = 17.27
b = 237.7 °C

The recommended system accuracy for dew point temperature is ±1.5°C of observed.

Calibration Procedure for an ETI NOAH II Precipitation Gauge

1.0 Introduction

All ETI NOAH II precipitation gauges (hereafter referred to as precipitation gauges) are calibrated at the factory before receipt. Therefore, the calibration schedule for a precipitation gauge requires an initial calibration check, and calibrations every 6 months. Calibrations are also required immediately after any repair, rewiring, adjustment, or replacement of the sensor or any sensor components.

Equipment required for precipitation gauges calibration is as follows:

1. NovaLynx 260-2595 Tipping Bucket Rain Gauge Calibrator or large graduated cylinder.
2. PC or similar display module with P7GACOMM
3. ETI NOAH II manual

The calibration should be started by completing the top of the Precipitation Gauge Calibrations Form.

1.1 System Inspection

Before determining the initial response of the precipitation measurement system, inspect the signal cable and sensor for signs of damage and wear. Note these observations in the Precipitation Gauge Calibrations Form.

2.0 Pre-Adjustment Checks

2.1 System Check

To ensure that the weight measurement assembly (WMA) is functioning, slowly pour an initial amount of water into the gauge and check for a response from the datalogger.

2.2 Gauge Check

A calibration is performed by inputting known amounts of water into the gauge using a NovaLynx 260-2595 Tipping Bucket Rain Gauge Calibrator or large graduated cylinder and checking the system response. Water is usually inputted into the gauge 800mL at a time, across the full range (4-12” liquid in gauge).

Water should be delivered to the gauge slowly, and poured onto the side of the gauge to buffer the flow. This will ensure that the sensitive load cell in the WMA does not become damaged.

After each bottle of water is added to the gauge, the measurement system should be given ample time to read. This value should be noted in the Precipitation Gauge Calibrations Form. The values should agree within ±10% of the expected. If possible check the linearity of the instrument by fitting a curve and checking the slope and intercept of the Y = X line.

3.0 Maintenance and Adjustments

After performing all system inspections and calibration checks the results should be reviewed to determine what maintenance and adjustments are needed, if any. Maintenance procedures should follow the manufactures recommendations in the manual provided by the manufacturer. Due to limited time and marginal weather in the field a true field calibration of the sensor can rarely be performed. Therefore, any sensor not conforming to within ±10% of the expected values will most likely need to be replaced and sent back to the factory for a true calibration.

4.0 Post-adjustment Checks

If maintenance or adjustments were made, the steps listed in Section 2.0 should be repeated and the results recorded in the Precipitation Gauge Calibrations Form. If the outputs do not agree within the specified limits troubleshooting, maintenance, and adjustments should be performed and noted.

5.0 Conclusion

When the instrument provides the proper response to the expected calibration values, complete the calibration form noting any adjustments, maintenance or repairs made. Sign and date the calibration form underneath any notes made in the comments section.

Audit Procedure for an ETI NOAH II Precipitation Gauge

An audit of an ETI NOAH II precipitation gauge is performed by inputting known amount of water into the gauge using a NovaLynx 260-2595 Tipping Bucket Rain Gauge Calibrator or large graduated cylinder. Water is usually inputted into the gauge 800mL at a time, across the full range (4-12" liquid in gauge).

Water should be delivered to the gauge slowly, and poured onto the side of the gauge to buffer the flow. This will ensure that the sensitive load cell in the weight measurement assembly (WMA) does not become damaged. Ample time should be given for the gauge to calculate and read the delivered amount of liquid.

After each bottle of water is added to the gauge, the system measurement should be noted in the Precipitation Gauge Audit Form. The values should agree within ±10% of the expected. If possible check the linearity of the instrument by fitting a curve and checking the slope, intercept, and R^2 of the Y = X line.

Audit procedure is as follows:

1. Fill out the top of the Precipitation Gauge Audit Form noting the prevailing meteorological conditions.

2. Deliver water to the gauge in measured increments across the full range of the gauge, noting the volume delivered, expected and system response, and percent error.

3. Compare the error of the gauge to the limit of ±10%.

For the gauge to pass the audit each point taken must agree to the expected value within ±10%. The slope, intercept, and R^2 value for the Y = X line should also agree within ±10% of expected.

Calibration Procedure for a Nova Lynx 255-100 Evaporation Gauge

1.0 Introduction

All Nova Lynx 255-100 evaporation gauge (hereafter referred to as evaporation gauge gauges) are calibrated at the factory before receipt. Therefore, the calibration schedule for an evaporation gauge requires an initial calibration check, and calibrations every 6 months. Calibrations are also required immediately after any repair, rewiring, adjustment, or replacement of the sensor or any sensor components.

Equipment required for precipitation gauges calibration is as follows:

1. Large graduated cylinder or similar water delivery device
2. Ruler
3. PC or similar display module
4. Nova Lynx 255-100 manual

The calibration should be started by completing the top of the Evaporation Gauge Calibrations Form.

1.1 System Inspection

Before determining the initial response of the precipitation measurement system, inspect the signal cable and sensor for signs of damage and wear. Note these observations in the Evaporation Gauge Calibrations Form.

2.0 Pre-Adjustment Checks

2.1 System Check

To ensure that the float mechanism is functioning, slowly pour an initial amount of water into the gauge and check for a response from the datalogger.

2.2 Gauge Check

A calibration is performed by inputting known amounts of water into the gauge using a large graduated cylinder, measuring the height of the water in the evaporation pan, and checking the system response. Water is usually inputted into the gauge 800mL at a time, across the full range (3-9” liquid in gauge).

After each bottle of water is added to the gauge, the measurement system should be given ample time to read. This value should be noted in the Evaporation Gauge Calibrations Form. Check the linearity of the instrument by fitting a curve and checking

the slope and intercept of the Y = X line. These values should agree within ±10% of the expected.

3.0 Maintenance and Adjustments

After performing all system inspections and calibration checks the results should be reviewed to determine what maintenance and adjustments are needed, if any. Maintenance procedures should follow the manufactures recommendations in the manual provided by the manufacturer.

4.0 Post-adjustment Checks

If maintenance or adjustments were made, the steps listed in Section 2.0 should be repeated and the results recorded in the Evaporation Gauge Calibrations Form. If the outputs do not agree within the specified limits troubleshooting, maintenance, and adjustments should be performed and noted.

5.0 Conclusion

When the instrument provides the proper response to the expected calibration values, complete the calibration form noting any adjustments, maintenance or repairs made. Sign and date the calibration form underneath any notes made in the comments section.

Audit Procedure for a Nova Lynx 255-100 Evaporation Gauge

An audit of an Nova Lynx 255-100 evaporation gauge is performed by inputting known amount of water into the gauge using a large graduated cylinder or similar type of water delivery device. Water is usually inputted into the gauge 800mL at a time, across the full range (3-9" liquid in gauge).

Water should be delivered to the gauge slowly and ample time should be given for the gauge to read and calculate the delivered amount of liquid.

After each bottle of water is added to the gauge, the system measurement should be noted in the Evaporation Gauge Audit Form. Check the linearity of the instrument by fitting a curve and checking the slope and intercept of the Y = X line. These values should agree within ±10% of the expected.

Audit procedure is as follows:

4. Fill out the top of the Evaporation Gauge Audit Form noting the prevailing meteorological conditions.

5. Deliver water to the gauge in measured increments across the full range of the gauge, noting the level of water in gauge and system response.

6. Compare the linearity of the gauge to the limit of ±10%.

For the gauge to pass the audit the slope and intercept of the Y = X line should agree within ±10% of expected.

Systems Audit Procedures for the Pebble Project Meteorological Monitoring Program.

1.0 Introduction

A systems audit is an on-site inspection and review of the quality assurance system used for the total measurement system (sample collection, sample analysis, data processing, ect.) for each monitored parameter. Whereas, performance audits are quantitative appraisal, system audits are normally a qualitative appraisal. The standard operating procedures (SOP) in the projects analysis plan should be used as the basis for conducting a system audit. The purpose of a system audit is to determine whether or not the monitoring program has followed the SOP and quality control procedures and listed in the projects analysis plan. It also determines if the data generated are scientifically valid, defensible, and of specified accuracy and precision.

2.0 Audit Items

The following are typical items checked in a systems audit for a PSD Meteorological Monitoring Program:

1. Is the quality assurance organization operational

2. Are there written standard operation procedures (SOP) available for site operation and sampling, and are they being followed?

3. Are there written calibration procedures and schedules, including traceability documentation, and are they being followed?

4. Are there preventative maintenance procedures and are they being followed?

5. Are site logbooks, site checks forms, and other documentation being used and properly completed?

3.0 Audit Goals

The goal of a systems audit is to ass the overall operation of the quality assurance system. System audits generally entail the following procedures:

1. Preparing audit questionnaires for the monitoring site evaluations (F/ST9001.1) and for evaluation of the office activities related to the monitoring (F/ST9001.2).

2. Identifying deficiencies from previous audits and preparing a checklist covering these areas.

3. Arranging entrance interviews and briefing the site operator on the purpose and the scope of the systems audit.

4. Performing the systems audit.

5. Conducting exit interviews and debriefing on the system audit results

6. Preparing and submitting audit reports

7. Following up on report recommendations.

A systems audit will be conducted within 30 days of the commencement of the filed program in order to insure that all of the QA project plans specified procedures have been implemented. An early assessment is designed to prevent the accumulation of a large amount of questionable to invalid data bay quickly uncovering any discrepancies between the project plan and the actual monitoring effort. Thereafter, a systems audit will be conducted yearly.

APPENDIX B2

1.0 INTRODUCTION

This Health and Safety Plan is a job-specific document presenting a comprehensive plan for compliance with the Hoefler Consulting Group HSE program. Hoefler Consulting Group (HCG) prepared this plan for the Pebble Project Meteorological Monitoring Program.

The plan incorporates a specific breakdown of the project activities, the planned communication and interface provisions that will be followed for the project. The intent is to summarize the scope of work and the associated health and safety issues with a focus on the needs of field personnel and successful execution of the project.

The established procedures found in the Alaska Safety Handbook (ASH) and the safety manual, *Mineral Exploration in Western Canada* are available as reference documents for implementing best practices for all project work activity and pre-job planning. A Phase Hazard Analysis (PHA) addresses the progressive steps of the project plan and field operations. Changes to a work plan or scope, after the plan is developed, poses significant potential for health and safety related incidents.

ANY CHANGE OF CONDITIONS THAT AFFECT THE PLAN WILL REQUIRE A SAFETY "TIME OUT" TO ASSESS HOW THAT CHANGE WILL IMPACT THE JOB AS PLANNED. WHEN ADDITIONAL HAZARDS ARE INTRODUCED INTO A PLANNED PHASE, CONTROLS WILL BE DISCUSSED WITH ALL PARTIES TO ENSURE SAFE EXECUTION DURING THE SAFETY "TIME OUT."

2.0 SCOPE OF WORK

Two three-meter meteorological stations will be installed and operated at the Pebble Project site. A radio repeating tower is already operating at the project location. Work will include instrument installation, establishing the power supply, and start-up and operation of the monitoring stations. All components are designed for rapid installation of the system in the field.

3.0 PROJECT EXECUTION PLAN

3.1 Phase 1: Mobilization

Mobilization consists of staging all necessary tools and equipment to the site. All equipment and personnel will travel from the base camp to the site via helicopter or snow machine. Prior to commencement of installation, HCG personnel will undergo a site-specific orientation, including familiarization with site facilities and operations personnel. HCG staff will also ensure that the pilot and site manager are aware of their location in the field in the event radio contact is interrupted. A back-up plan for pick-up will be established prior to beginning field work each day.

3.2 Phase 2: Installation

HCG personnel will begin to install equipment upon arrival. Electrical power such as 120 VAC for light hand tools and 12 VDC will be established first. All instrument components are 12 VDC, including heaters, fans, data logger and the cell phone/modem system.

3.3 Phase 3: Operation

Following successful installation of the equipment, initial performance audits and calibrations will be conducted to ensure equipment is operating within EPA and ADEC guidelines. These procedures require approximately one full day of work to complete. Subsequently, the meteorological station will operate unattended for an extended period of time**.** Quarterly audits, calibration, and maintenance will be conducted by HCG staff.

3.4 Phase 4: Demobilization

Demobilization operations consist of packing all tools, safety gear and HCG-owned equipment for transport back to Anchorage. The work area will be cleared of all work-related debris and litter and will be left in an orderly fashion.

4.0 PROJECT SCHEDULE

Installation activities are to be conducted in October 2004 and system upgrades are scheduled to be made in November 2004. Quarterly audits, calibrations and maintenance are scheduled to occur in 2005.

5.0 HAZARD ASSESSMENT

5.1 Health and Safety Risks Identified

The health and safety risks identified for the four defined phases of the project are as follows:

Phase		Personnel	Equipment
Phase 1	Mobilization	Low	Low
Phase 2	Installation	Medium	Medium
Phase 3	Operation	Low	Medium
Phase 4	Demobilization	Low	Low

5.1.1 Phase Hazard Analysis: Phase 1

Project: Pebble Project Meteorological Monitoring

Date: November 2004

Location: Iliamna, Alaska

Phase: Mobilization

Overall Risk Rank: Low

Phase Description: Initial project mobilization of employees, tools, and equipment to installation site.

Activities include:

- Travel to Pebble Project site near Iliamna, Alaska, site-specific orientation, familiarization with site facilities and operations personnel.
- Transporting, lifting, and rigging of tools and equipment.

POTENTIAL HAZARDS		RANK
1.	Lifting hazards	Medium
2.	Muscle strains / overexertion / dehydration / fatigue / hypothermia	Low
3.	Slips or falls from ladder.	Low
4.	Cuts and lacerations-striking against objects, pinch points and protruding objects, trip hazards.	Low
5.	Negative wildlife encounters	Low

Recommended Controls:

1. Ensure crew members understand all project hazards, are familiar with specific lifting equipment used, and utilize proper personal lifting techniques. Follow lifting safe work practices and avoid unsafe work acts. Ensure employees get help to move heavier objects, and utilize move-smart techniques, as well as proper body motion-mechanics when performing physical lifting.

2. Warm up and stretch before lifting or pulling. Drink plenty of water throughout the day. Avoid excessive amounts of coffee, teas, colas, sodas, juices, etc. These liquids will not re-hydrate an individual as well as water. Be prepared for inclement weather. Proper clothing (layered) for outside work activities is essential, and should include at a minimum: thermal underwear, arctic coverall gear, gloves, face mask, heavy socks, appropriately rated cold weather footwear (winter months). Get help with awkward loads. Ensure that employees are given sufficient time to conduct activities at the work site. Do not increase speed of activities. Ensure that employees are given multiple breaks throughout the workday.

3. Ensure footwear is in good repair, and always ensure solid footing. Situate ladders or stepstools on level ground, and use caution when working off the ground. Pay attention to surroundings.

4. Wear proper PPE to prevent personal injury. Anyone working at height will be trained in fall prevention/protection and will be wearing fall protection. Employees are to familiarize themselves with the immediate work area for any given task. Ensure power tools and extension cords are good working order. Visually inspect the equipment before use.

5. Be alert to surroundings. Do not leave food sources out that can attract animals. Carry personal firearms and/or bear mace or be in the company of someone who has firearms and is trained in firearm use.

Note:
A change to a plan after the plan was developed is a major reason for health and safety incidents.

ANY CHANGE OF CONDITIONS THAT AFFECT THE PLAN WILL REQUIRE A SAFETY "TIME OUT" TO ASSESS HOW THAT CHANGE WILL IMPACT THE JOB AS PLANNED. WHEN ADDITIONAL HAZARDS ARE INTRODUCED INTO A PLANNED PHASE, CONTROLS WILL BE DISCUSSED WITH ALL PARTIES TO ENSURE SAFE EXECUTION DURING THE SAFETY "TIME OUT".

Inspections/Audits:
The crew supervisor will review the upcoming work on a daily basis and review a Safety Analysis Form outlining safety procedures, safety equipment usage and the possible hazards associated with the work planned that day. The material will be presented to the crew as a "Tool Box Safety Meeting" prior to the start of work that day.

Possible Crew Members: Dominic Shallies, Jared Cockman, Brent Veltkamp, Chris Lindsey, Eric Brudie, Steve Mackey

Emergency Action Plan:
Provide first aid. Immediately notify Northern Dynasty Mines officials of the situation.

Additional Comments/Changes:

5.1.2 Phase Hazard Analysis: Phase 2

Project:	Pebble Project Meteorological Monitoring
Date:	November 2004
Location:	Iliamna, Alaska
Phase:	Installation
Overall Risk Rank:	Medium
Phase Description:	The meteorological station tripods will be installed at pre-determined field locations. Power will be connected to the instrumentation.

Activities include:

- Installing towers

- Installing/securing a data logger/controller enclosure at ground level
- Connecting 12 VDC electrical power

POTENTIAL HAZARDS		RISK
1.	Lifting Hazards	Medium
2.	Muscle strains / overexertion / dehydration / fatigue / hypothermia	Medium
3.	Slips or falls from ladder.	High
4.	Cuts and lacerations-striking against objects, pinch points and protruding objects	Medium
5.	Electrocution while connecting power supply	Low
6.	Negative wildlife contacts	Low

Recommended Controls:

1. Ensure crew members understand all project hazards, are familiar with the specific lifting equipment used in installation, and utilize proper personal lifting techniques. Follow lifting safe work practices and avoid unsafe work acts. Ensure employees get help to move heavier objects, and utilize move-smart techniques, as well as proper body motion-mechanics when performing physical lifting.

2. Warm up and stretch before lifting or pulling. Drink plenty of water throughout the day. Avoid excessive amounts of coffee, teas, colas, sodas, juices, etc. These liquids will not re-hydrate an individual as well as water. Be prepared for inclement weather. Proper clothing (layered) for outside work activities is essential, and should include at a minimum: thermal underwear, arctic coverall gear, gloves, face mask, heavy socks, appropriately rated cold weather footwear (winter months). Get help with awkward loads. Ensure that employees are given sufficient time to conduct activities at the work site. Do not increase speed of activities. Ensure that employees are given multiple breaks throughout the workday.

3. Ensure footwear is in good repair, and always ensure solid footing. Situate ladders or step stools on level ground and use caution when working off the ground. Pay attention to surroundings.

4. Wear proper PPE to prevent personal injury. Anyone working at height will be trained in fall prevention/protection and will be wearing fall protection. Employees are to familiarize themselves with the immediate work area for any given task.

5. Ensure power tools and extension cords are good working order. Visually inspect the equipment before use.

6. Be alert to surroundings. Do not leave food sources out that can attract animals. Carry personal firearms and/or bear mace or be in the company of someone who has firearms and is trained in the use of firearms.

Note:
A change to a plan after the plan was developed is a major reason for health and safety incidents.

ANY CHANGE OF CONDITIONS THAT AFFECT THE PLAN WILL REQUIRE A SAFETY "TIME OUT" TO ASSESS HOW THAT CHANGE WILL IMPACT THE JOB AS PLANNED. WHEN ADDITIONAL HAZARDS ARE INTRODUCED INTO A PLANNED PHASE, CONTROLS WILL BE DISCUSSED WITH ALL PARTIES TO ENSURE SAFE EXECUTION DURING THE SAFETY "TIME OUT".

Inspections/Audits:
The crew supervisor will review the upcoming work on a daily basis and review a Safety Analysis Form outlining safety procedures, safety equipment usage and the possible hazards associated with the work planned that day. The material will be presented to the crew as a "Tool Box Safety Meeting" prior to the start of work that day.

Possible Crew Members: Dominic Shallies, Jared Cockman, Brent Veltkamp, Chris Lindsey, Eric Brudie, Steve Mackey

Emergency Action Plan:
Provide first aid. Immediately notify Northern Dynasty Mines officials of the situation.

Additional Comments/Changes:
Audits and calibrations are scheduled for the spring and fall. These tests, which will involve two HCG personnel, should take one working day to complete. Various personnel will be involved in these site visits.

5.1.3 Phase Hazard Analysis: Phase 3

Project: Pebble Project Meteorological Monitoring
Date: November 2004
Location: Iliamna, Alaska
Phase: Operation
Overall Risk Rank: Low/Medium
Phase Description: Following successful equipment setup, initial audits and calibrations will be conducted. These activities will take approximately one full work day to complete. Subsequently, the meteorological stations should operate unattended for an extended period of time.

Activities Include:

- Initial calibration and audits
- Periodic calibrations and audits

	POTENTIAL HAZARDS	RISK
1.	Lifting Hazards	Low
2.	Muscle strains / overexertion / dehydration / fatigue / hypothermia	Low
3.	Cuts and lacerations-striking against objects, pinch points and protruding objects	Low
4.	Electrocution	Low
5.	Negative wildlife contacts	Low

Recommended Controls:

1. Ensure crew members understand all project hazards, are familiar with the specific lifting equipment used in installation, and utilize proper personal lifting techniques. Follow lifting safe work practices and avoid unsafe work acts. Ensure employees get help to move heavier objects, and utilize move-smart techniques, as well as proper body motion-mechanics when performing physical lifting.

2. Warm up and stretch before lifting or pulling. Drink plenty of water throughout the day. Avoid excessive amounts of coffee, teas, colas, sodas, juices, etc. These

liquids will not re-hydrate an individual as well as water. Be prepared for inclement weather. Proper clothing (layered) for outside work activities is essential, and should include at a minimum: thermal underwear, arctic coverall gear, gloves, face mask, heavy socks, appropriately rated cold weather footwear (winter months). 5.1.4 Phase Hazard Analysis: Phase 4

Project: Pebble Project Meteorological Monitoring
Date: November 2004
Location: Iliamna, Alaska
Phase: Demobilization
Overall Risk Rank: Low
Phase Description: Demobilization consists of packing all tools, equipment and safety gear for transport back to Anchorage. The work area will be cleared of all debris and left in an orderly fashion.

Activities Include:

- Removal of all tools, and unused equipment and materials.
- Clean up and housekeeping at the job site and any other areas utilized as workspace or materials lay-down areas.
- Proper disposal of any waste materials generated during this installation.

	POTENTIAL HAZARDS	RISK
1.	Lifting Hazards	Low
2.	Muscle strains / overexertion / dehydration / fatigue / hypothermia	Medium
3.	Cuts and lacerations-striking against objects, pinch points and protruding objects	Low
4.	Electrocution while demobilizing system	Low
5.	Negative wildlife contacts	Low

1. Ensure crew members understand all project hazards, are familiar with the specific lifting equipment used in installation, and utilize proper personal lifting techniques. Follow lifting safe work practices and avoid unsafe work acts. Ensure employees get help to move heavier objects, and utilize move-smart techniques, as well as proper body motion-mechanics when performing physical lifting.

2. Warm up and stretch before lifting or pulling. Drink plenty of water throughout the day. Avoid excessive amounts of coffee, teas, colas, sodas, juices, etc. These liquids will not re-hydrate an individual as well as water. Be prepared for inclement weather. Proper clothing (layered) for outside work activities is essential, and should include at a minimum: thermal underwear, arctic coverall gear, gloves, face mask, heavy socks, appropriately rated cold weather footwear (winter months). Get help with awkward loads. Ensure that employees are given sufficient time to conduct activities at the work site. Do not increase speed of activities. Ensure that employees are given multiple breaks throughout the workday.

ANY CHANGE OF CONDITIONS THAT AFFECT THE PLAN WILL REQUIRE A SAFETY “TIME OUT” TO ASSESS HOW THAT CHANGE WILL IMPACT THE JOB AS PLANNED. WHEN ADDITIONAL HAZARDS ARE INTRODUCED INTO A PLANNED PHASE, CONTROLS WILL BE DISCUSSED WITH ALL PARTIES TO ENSURE SAFE

EXECUTION DURING THE SAFETY "TIME OUT".

Inspections/Audits:
The crew supervisor will review the upcoming work on a daily basis and review a Safety Analysis Form outlining safety procedures, safety equipment usage and the possible hazards associated with the work planned that day. The material will be presented to the crew as a "Tool Box Safety Meeting" prior to the start of work that day.

Possible Crew Members: Dominic Shallies, Jared Cockman, Brent Veltkamp, Chris Lindsey, Eric Brudie, Steve Mackey

Emergency Action Plan:
Provide first aid. Immediately notify Northern Dynasty Mines officials of the situation.

Additional Comments/Changes:

6.0 ADDITIONAL SAFETY CONSIDERATIONS

- Field crews must always work in pairs and carry a radio.
- No alcohol or illegal drug consumption is allowed.
- Those who carry epi-pens for allergic reactions are to advise NDM and other members of the field crew so that assistance can be provided if necessary.
- Be aware of the rules regarding the possession of firearms and/or bear mace when traveling to the project area. A weapon must be unloaded before boarding the helicopter and unloaded and securely stored while in camp. The name of the individual bringing a firearm into camp must be given to Richard Moses (NDM Site Manager or his designee) prior to arrival. Permission to carry bear mace must be obtained from the pilot before boarding the helicopter.
- Field crews need to understand the risk of extreme weather and the possibility of staying overnight in the field.

7.0 EMERGENCY CONTACTS & MEDICAL PROCEDURES

7.1 Northern Dynasty Emergency Contact Information

c/o Iliamna Weathered Inn #1 Roadhouse Strip or Box 124 Iliamna, AK 99606 Tel: (907) 571-1872 or 1774 Home: (907) 571-1872 Fax: (907) 571-1789 Email: richardm@hdgold.com	1020-800 West Pender St. Vancouver, B.C. Canada V6C 2V6 Tel: (604) 684-6365 Toll Free: 1-800-667-2114 Fax: (604) 662-8956

7.2 Local Emergency Medical Services

Iliamna Clinic — Located on the Roadhouse Strip
Telephone: (907) 571-1383

Rene (Health Aid) — Home Telephone: (907) 571-1323

7.3 INTERFACE DOCUMENT

HCG has developed an Interface Document (Table 7-1) that outlines the interface HCG field and office personnel. Serious incidents must be reported immediately, while less serious ones shall be reported within the shift in which the incident occurred. This will include the completion of all necessary forms and documentation.

Interface Document
Table 7-1

Activity	Primary HCG Contact	Secondary HCG Contact
Environmental Non-compliance	Steve Mackey (563-2129)	Al Trbovich (563-2140)
Environmental Incident Reporting	Steve Mackey (563-2129)	Al Trbovich (563-2140)
Unauthorized/unaccompanied individuals on site	Steve Mackey (563-2129)	Al Trbovich (563-2140)
Compliance Audits: Scheduling, developing, conducting	Steve Mackey (563-2129)	Al Trbovich (563-2140)
Emergency Reporting	Steve Mackey (563-2129)	Al Trbovich (563-2140)
Agency Reporting	Steve Mackey (563-2129)	Al Trbovich (563-2140)
Field Installation Activities	Steve Mackey (563-2129)	Al Trbovich (563-2140)

7.4 MEDICAL EMERGENCY PROCEDURES

(1) Contact Northern Dynasty Mines Base Camp in Iliamna by radio or telephone. Radio frequency being used is 151.625 MHz with a 123.000 MHz transmit and receive tone (private line).

(2) Contact Alaska State Troopers Dispatch: (907) 428-7200 (24 hrs/day).

In the event of a major emergency, the Alaska State Troopers will mobilize a response, including contacting the local State Trooper, medical, and rescue personnel.

Information to provide:

- Who you are
- Nature of emergency
- Your location
- Your company and contact number
- Number of victims
- Sex, age and vital signs of patients (if possible)
- Specific injuries

(3) Local emergency support in Iliamna and Newhalen:

- Iliamna State Trooper: (907) 571-1534
- Iliamna Clinic (Health Aid): (907) 571-1383
- Newhalen Clinic: (907) 571-1248
- Iliamna Air Taxi (has air Medivac capability): (907) 571-1245 / (907) 871-1445

PROJECT FORMS

Site Visit & System Check

Date: _____

Project Title: _____ **Project No.** _____

Name of Inspector: _____

Associated Company: _____

Sate Reason for visit: _____
_____
_____

_____

Check List

Tower:

- Check tower for stability, ensure that guy wires are taunt and all clamping hardware is in good condition.
- Check that all sensors are securely mounted to tower. This includes antennas and enclosures.
- Check for excessive ice build-up on tower and sensor mounts
- Check for loose instrument cables

Comments: _____

Sensors:

Wind Direction:

- Check to see if wind vane is moving freely or fluttering in wind.
- Check for excessive ice or snow build-up on vane and sensor if so clear the sensor.
- After clearing ice or snow, check to see if vane can move freely in all directions.

Wind Speed:

- Check to see that cups are spinning freely.
- Check for excessive ice or build-up on vane and sensor, if so clear the sensor.
- After clearing ice or snow, check cups to insure they spin with ease.
- Clear ice or snow off of wind sensor cross arm.

All other sensors:

- Check sensor housing or brackets for visible damage.
- Check all sensor connection and cables to ensure good connections and secured to tower.
- Clear any ice or snow from sensor brackets and mounts.
- Check each sensor mount to ensure the sensor is level and secure.

Corrective Action Plan

The corrective action plan is designed to address the many unexpected problems that may arise during the project duration. HCG personnel are instructed to immediately bring any major problems to the attention of the project supervisor. Since many individuals could become involved in the corrective action, the notification is best done by a standard corrective action form.

This Corrective Action Form exists in three parts to address and correct program that occur during routine operation or as a result of performance evaluation and technical systems audits. The three parts are listed below:

- Request for Assistance
- Proposed Corrective Action
- Results of Proposed Corrective Action

It is recommended that all personnel signing the form should feel free to attach other needed material. These forms are stored at the HCG office both in electric and paper format.

Hoefler Consulting Group

Training/Education/Experience:

- How is program staff trained?_____
- Who is responsible for training staff?

Does the operator have training manuals or other training related materials available for staff?

Yes
No

3.0 General Program Information

3.1 Monitoring Site Description

Monitoring Site Name:

Monitoring Site Location Description:

Indicated by Operator	Determined by Auditor

3.2 Monitoring Site Appearance and Safety

Does the site appear clean, organized and well maintained?	Yes No	Comments:
Does the site appear to be safe and reasonably hazard free?	Yes No	Comments:
Does the site have a shelter for operators?	Yes No	Comments:
Does the site have emergency equipment such as a first aid kit available?	Yes No	Comments:
Does the site have adequate measures to prevent human tampering?	Yes No	Comments:
Does the site have adequate measures to prevent damage from animals?	Yes No	Comments:

3.3 Monitoring Site Surroundings

- Indicate the population density type for the monitoring site.

	Type	Description
	Remote	No nearby development with no nearby population center.
	Rural	Limited development with nearby sparse population.
	Low Suburban	Light industrial development in low population center.
	High Suburban	Light industrial development in high population center.
	Urban	Heavy industrial development in high population center.

3.4 Monitoring Site Equipment Inventory

- List all parameters that are being monitored and their associated instrumentation at the site.

Parameter	Make	Model	Serial No.

- List all instrumentation used in support of the monitoring instrumentation.

Instrument	Make	Model	Serial No.

3.5 Meteorological Instrumentation Siting and Exposure (EPA-454/R-99-005)

Do all sensors appear to be clean, intact, in good condition and well maintained?	Yes No	Comments:
Are all sensors operational, online and reporting data?	Yes No	Comments

3.5.1 Tower

Do all obstructions exist below a 1:10 slope away from the tower base?	Yes No	Comments
Is the height of the tower 10 meters above the ground?	Yes No	Comments:
Is the tower stable and plumb?	Yes No	Comments:
Is the tower protected from lightning?	Yes No	Comments:

3.5.2 Wind Speed and Wind Direction

Is the horizontal distance between the instrument and any obstruction at least 10 times the height of the obstruction?	Yes No	Comments:
Is the instrument 1.5 times the height of the building above the roof or 10 meters above the ground?	Yes No	Comments:
Are the wind speed and wind direction sensors stable and plumb?	Yes No	Comments:
Is the distance of the sensor on the cross arm/mast at least twice the diameter of the tower?	Yes No	Comments:
Is the wind sigma theta collected according to EPA requirements?	Yes No	Comments:

3.5.3 Air Temperature, Air Temperature Difference, and Relative Humidity

Are the sensors mounted over open level ground at least 9 meters in diameter and at least 2 meters above ground?	Yes No	Comments:
Are the two temperature difference probes located at a height of 2 meters and 10 meters above the ground?	Yes No	Comments
Is the ground beneath the temperature sensor natural native material?	Yes No	Comments
Is the site free of any man-made features exist that could create bias temperature data (e.g. asphalt, concrete, exhaust plumes, etc.)?	Yes No	Comments:
Is the site free of any natural made features that could create bias temperature data (e.g. open water, sloping ridge, etc.)?	Yes No	Comments:
Are the temperature sensors protected from the influence of solar radiation?	Yes No	Comments:
Are the sensors located at least four times the distance from the height of the obstruction?	Yes No	Comments:
Are the sensors located at least 30 meters from large paved areas?	Yes No	Comments:
Are the temperature sensors used for differential measurements located in identical aspirated shields?	Yes No	Comments:

3.5.4 Solar Radiation

Is the instrument situated above the plane of any obstructions that could cast shadows on the instrument?	Yes No	Comments:
Is the sensor situated to the south of the tower in order to minimize obstruction from the tower?	Yes No	Comments:

3.5.5 EPA Recommended Instrument Resolutions

Parameter	Equipment Specifications	EPA Resolution Standard	Meets Standard?

3.5.6 Recommended Instrument Accuracy Standards

Parameter	Equipment Specifications	EPA Accuracy Standard	Meets Standard?

3.5.7 EPA Recommended Instrument Response Standards

Parameter	Equipment Specifications	EPA Response Standard	Meets Standard?
Wind Speed			
Threshold:			
Distance Constant:

Air Temperature (10 meter)			
Time Constant:			
Relative Humidity			
Time Constant:			
Range:			
Solar Radiation			
Time Constant:			
Operating Range:			
Spectral Response:			

3.6 Support Instrumentation and Equipment

Is the DAS well protected from the elements with adequate room for maintenance?	Yes No	Comments:
Is the DAS rated for operation in the expected local temperature range?	Yes No	Comments:
Are all sensor signal leads neatly and securely connected to the correct DAS channels?	Yes No	Comments:
Are all components of the DAS operational?	Yes No	Comments:
Is the communications equipment operating correctly?	Yes No	Comments:
Does the DAS system have a stable power supply?	Yes No	Comments:

Is the DAS properly grounded?	Yes No	Comments:
Is the DAS system protected from lightning?	Yes No	Comments:

4.0 Data Processing

4.1 Data Collection

Is the monitoring station polled on a regular basis?	Yes No	Comments:
Is the PM sample run date recorded?	N/A	Comments:
Is the PM sample start time and elapsed time recorded?	N/A	Comments:
Is the PM average flow rate recorded?	N/A	Comments:
Is each PM filter recovered after each run period?	N/A	Comments

- Indicate how the polled data are handled for data processing after being downloaded.

Are procedures in place for backing up raw data?	Yes No	Comments:

- How long are backup raw data files retained?
- How long are archived records retained?

Are hard copies of data being kept in case of computer failure?	Yes No	Comments:

4.2 Data and Sample Handling

Are written procedures for data handling available for the project?	Yes No	Comments:
Are filters properly secured once removed to prevent contamination or tampering?	N/A	Comments:

Are copies of the Site Check Forms being sent to the operator on a regular basis?	N/A	Comments:.
Are Chain-of-Custody forms being used to transmit materials, samples, and/or documents to and from the field?	N/A	Comments:
Are filters folded in half with collection surfaces in contact for transport to the lab?	N/A	Comments:
Are samples maintained in a secure location while awaiting shipment to the laboratory?	N/A	Comments:

- Diagram the data flow from monitoring equipment to submission of final report.

4.3 Data Validation

Are data validation procedures established and in use?	Yes No	Comments:

- Describe data validation procedure.

Are the individuals responsible for data collection separate from those responsible with data validation?	Yes No	Comments:

- Identify those responsible with data validation:

Name:
Position:
Affiliation:

- Identify how periods of missing or invalidated data are handled.

4.4 Data Reporting

Are quarterly and annual data reports being submitted for the site?	Yes No	Comments:
Is qualified staff prior to submittal of data reports making reviews of the report?	Yes No	Comments:

- Identify those person(s) responsible for review of data reports.

Name:
Position:
Affiliation:

4.5 Corrective Actions

Are procedures established for initiating corrective actions within the data processing steps?	Yes No	Comments:

- Describe procedures for tracking and closing corrective actions.

Data Capture (Section 4.5 EPA-454/R-99-005)

- Identify the desired data capture rate for the monitoring data.

Meteorological Monitoring Data Type	Capture Rate

Are the desired data capture rates being met for each data type?	Yes No	Comments:

5.0 Quality Assurance and Quality Control

5.1 Quality Assurance Program Plan

Has a quality assurance program plan (QAPP) been written that describes quality assurance procedures?	Yes No	Comments:
Is a copy of the plan available to field and data processing personnel?	Yes No	Comments:
Has the quality assurance plan been approved by the ADEC?	Yes No	Comments:

- Identify those person(s) responsible for updating the plan and the procedure for updating the plan.

Name:
Position:
Affiliation:

5.1.1 Quality Assurance Assessment Requirements (Section 8.0 EPA-454/R-99-005)

Have adequate audit procedures been identified within the quality assurance plan?	Yes No	Comments:
Does the plan adequately document the correct criteria for accuracy and precision?	Yes No	Comments:

- Indicate the project's correct precision and accuracy limits.

Parameter	***Precision Limit***	***Accuracy Limit***	***Reference***
DAS Time			
Wind Direction			
Wind Speed			
Air Temperature			
Air Temperature Difference			
Relative Humidity			
Solar Radiation			
Barometric Pressure			

5.2.1 Standard Operating Procedures

- Indicate the Standard Operating Procedures that have been developed for the program:

Standard Operating Procedures	
	Installation, Setup, and Checkout
	Site Operations and Calibrations
	Operational Checks and Preventive Maintenance
	Data Collection Protocols
	Data Validation Steps
	Data Archiving

5.2.2 Preventive Maintenance

Does a preventive maintenance program exist for the monitoring program and is the program being followed?	Yes No	Comments:

- Identify those responsible parties for preventive maintenance at the site.

Name:
Position:
Affiliation:

- Identify the preventative maintenance procedures conducted for the site.

5.2.3 Station Documentation

Is the Monitoring/QA plan comprehensive and reflective of the actual installation?	Yes No	Comments:
Does the station have an activity log?	Yes No	Comments:
Does the station have a Site Visit Log and Checklist Form?	Yes No	Comments:
Does the station have an adequate Calibration Report Forms and copies of previous calibrations?	Yes No	Comments:
Does the station have an adequate Operations Manual?	Yes No	Comments:

- Identify the operation manuals present on site.

Description

Are report forms and site logs properly completed and current?	Yes No	Comments:

6.0 Comments and Suggestions

Site Training Check list

This form should be included with the site visit memos. All training is site specific and is to be given by qualified HCG personal only.

Date of Training: _____

Station Name:_____ Project No._____

Name of Trainer: _____ Position: _____

Name of Trainee: _____ Position: _____

Nature of Training: _____

Is the trainee HCG personnel? If not specify associated company. Yes □ No □

Specify company name: _____ Position: _____

Site surveillances/maintenances visits:

- □ Has the specific monitoring project overview and objectives been discussed?
- □ Has site location and all safety concerns been discussed in detail?
- □ Has the scope of the site surveillances visit been discussed?
- □ Have all specific concerns pertaining to meteorological station been discussed.
- □ Has all site surveillance visit forms and filling procedures been discussed in detail?
- □ Have all site surveillances/maintenances visit task been clearly explained and demonstrate, including all equipment and senor operation, and safety practices pertaining to these tasks?
- □ Have all "as left" procedures been explained and demonstrated?

Audit and Calibration Visits:

- ☐ Has the specific monitoring project overview and objectives been discussed?
- ☐ Has the scope of the audit or calibration visit been discussed in detail?
- ☐ Have all specific concerns pertaining to meteorological station including any environmental safety concerns been discussed?
- ☐ Have all the audit or calibration forms, site visit documentation and filling procedures been discussed in detail?
- ☐ Have the functions and operations of each instrument located at the site been explained and demonstrated in detail?
- ☐ Have all audit or calibration task, tests, and recording techniques been clearly explained and demonstrated?
- ☐ Have all safety practices penetrating to the above task been clearly explained and demonstrated?
- ☐ Have all filling procedure and deadlines been discussed in detail?
- ☐ Have all "as left" procedures been explained and demonstrated?

APPENDIX C
STATEMENT OF QUALIFICATIONS

HOEFLER

CONSULTING GROUP

Air Quality Monitoring Services

Hoefler Consulting Group is an Anchorage-based consulting firm specializing in comprehensive environmental permitting and compliance services for Alaskan industries. Hoefler provides technical services supporting construction and operation of facilities in Alaska's unique physical, regulatory, and political environment. Hoefler is the leading air quality consulting firm in Alaska. The firm's staff of 40 professionals provides the following services from our Anchorage offices:

- PSD and non-PSD construction permitting
- Title V operating permitting
- Meteorological and ambient air quality monitoring programs
- Criteria pollutant, HAP, and greenhouse gas emission inventories
- Best available control technology demonstrations
- Air modeling compliance demonstrations
- Risk assessment
- Open burning approvals
- Certified opacity readings
- Source test supervision and support

Summaries of Experience for Key Personnel

ALAN M. TRBOVICH, CCM,

Vice President

Al Trbovich is a Certified Consulting Meteorologist and the Air Quality Team Leader of the Hoefler Consulting Group. He has 26 years of environmental permitting and regulatory compliance experience, and has been providing air quality services to his Alaskan clients throughout the state since 1998. Mr. Trbovich has extensive experience working with all facets of air permitting including construction ("PSD") and operating ("Title V") permitting, meteorological and ambient monitoring, compliance monitoring, source testing, and risk assessments. He is also a specialist in air quality modeling and has conducted ambient air quality and/or visibility modeling studies throughout Alaska. He has also lead numerous multi-disciplinary teams in preparing air permit applications, environmental impact statements, and other environmental studies. Mr. Trbovich holds B.S. and M.S. degrees in Meteorology from the University of Utah.

K. STEVEN MACKEY

Senior Project Manager

Steve Mackey is the Project Manger for the Air Quality Group at Hoefler Consulting group. He has over 20 years of air quality experience in air quality services project management as well as database development and management. His specialties include ambient air monitoring, meteorological monitoring, continuous emission monitoring systems (CEMS), source emissions measurement, and regulatory Compliance. Mr. Mackey holds B.S. degree in mechanical engineering from the University of Washington.

ERIC L. BRUDIE

Air Quality Consultant

Eric Brudie is an independent Air Quality Consultant that works with the Air Quality Group at Hoefler Consulting. He has over 22 years of air monitoring experience in air quality services. Mr. Brudie works with Hoefler Consulting as an independent contractor who specializes in conducting performance and systems audits of numerous PSD quality meteorological monitoring systems. His experiences include designee and operating numerous remote meteorological monitoring systems for the TAGS project, including the LNG terminal site 40-meter remote system. He functioned as a key team member in the preparation and agency approval of the Meteorological Monitoring & QA/QC Plan and the Application for Air Quality Control Permit to Operate with PSD Review for the proposed LNG liquefaction plant. Mr. Brudie holds a B.S. in Geological Engineering from the Colorado School of Mines.

JARED H. COCKMAN

Project Associate

Jared Cockman is a Project Associate with the Air Quality Group at Hoefler Consulting; He has over more than 4 years experience in air monitoring project support. Mr. Cockman holds an EPA Method 9 Visibility Certification for Alaska and his experiences include visible emissions monitoring, meteorological and ambient air quality monitoring, technical support for permit compliance, data management, management information systems, technical writing and editing, and document processing and production. Mr. Cockman holds a B.A. in English Literature from East Carolina University.

BRENT S. VELTKAMP

Associate Scientist

Brent Veltkamp is a Associate Scientist at Hoefler Consulting. He assists in field project support and meteorological monitoring site operations for Air Quality Group. He has over 12 years experience in environmental monitoring and remediation. His specialties include meteorological monitoring station installation and maintenance, maintenance of bioremediation systems, biological fieldwork and sampling techniques, wetland delineation, site assessment, and technical writing and editing. Mr. Veltkamp holds a BS in Biological Science from Colorado State University.

W. DOMINIC SHALLIES

Project Assistant/ Field Technician

Dominic Shallies is a Project Assistant at Hoefler Consulting. He assists in field project support and meteorological monitoring site operations for Air Quality Group. He has over 3 years experience in environmental monitoring and meteorological data collection. His specialties include PSD quality meteorological monitoring station installation and operation, data management, site assessment, and technical writing and editing. Mr. Shallies holds a BS in Environmental Science from the University of Alaska Southeast.

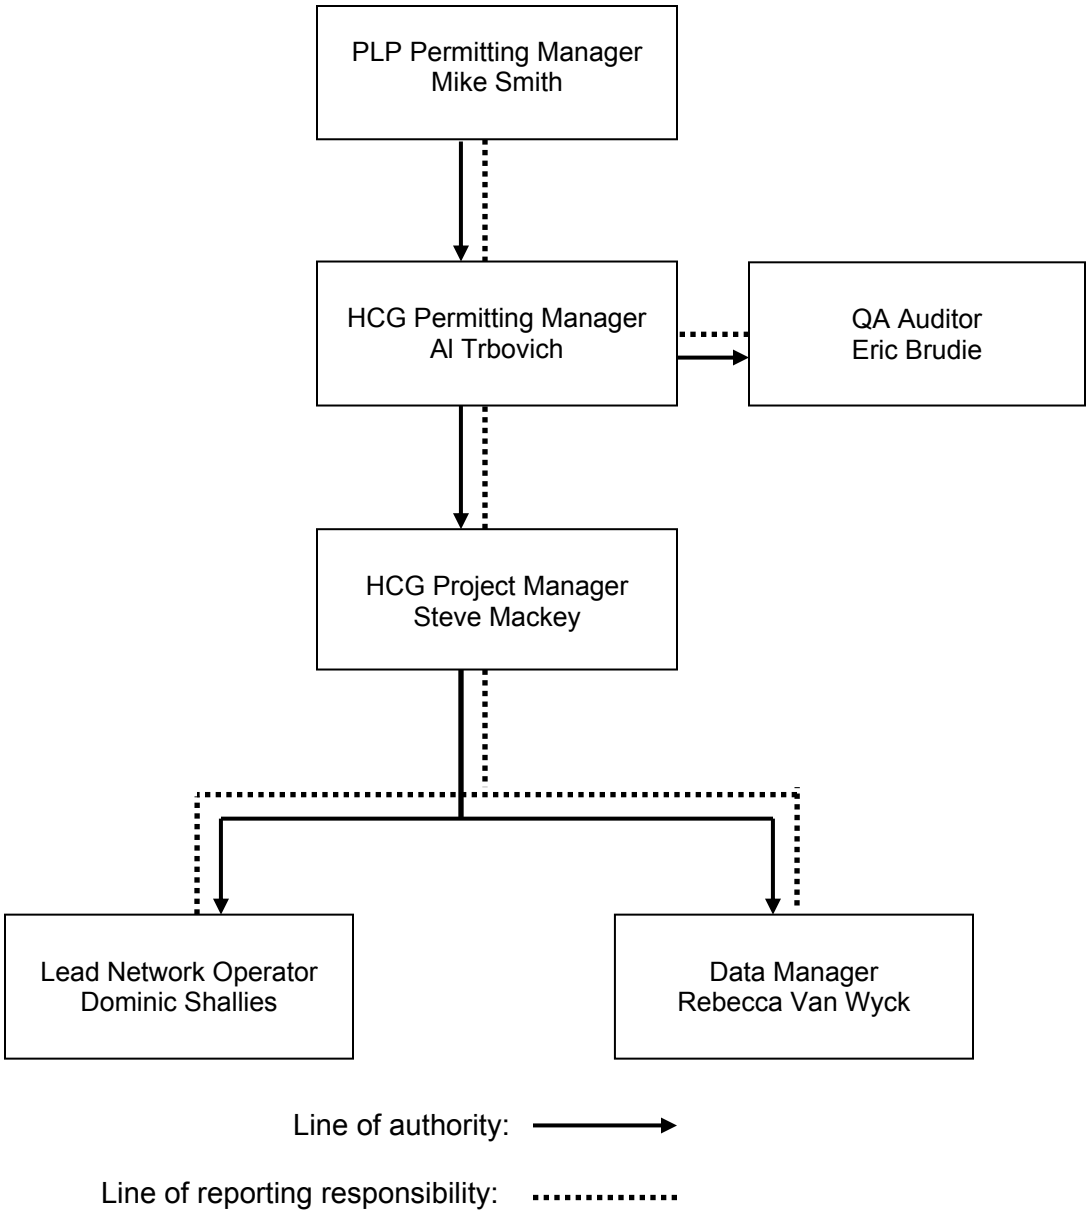
A4. Project/Task Organization

On behalf of The Pebble Limited Partnership (PLP), care of Pebble Mines Corp., its general partner, HCG Inc., dba Hoefler Consulting Group will assist in the installation, operation, and maintenance of meteorological monitoring stations for the Pebble Project located near Iliamna, Alaska. Figure A1 provides the organization plan for this project. The key personnel involved with this project and their respective responsibilities are summarized in Table A2. HCG will be responsible for all aspects of air monitoring, database management, and reporting.

Table A2. Pebble Project Meteorological Monitoring Program Key Individuals and Responsibilities

Key Individual	Responsibilities
PLP Permitting Manager	Mike Smith is the permitting manager for the Pebble Project and is responsible for complete program oversight.
HCG Permitting Manager	Al Trbovich is responsible for coordinating the meteorological monitoring program with PLP air permitting requirements.
HCG Project Manager	Steve Mackey is responsible for management of the technical staff conducting the PLP meteorological monitoring program and ensuring that the project is completed within established schedules and budgets.
Quality Assurance Auditor	Eric Brudie is responsible for auditing the validity and accuracy of reported information and coordinating follow-up activities to ensure a defensible data set.
Lead Network Operator	Dominic Shallies is responsible for installation and routine operation of the monitoring stations.
Data Manager	Rebecca Van Wyck is responsible for maintaining the project databases for all field data and for preparing data reports.

Figure A1. Pebble Project Meteorological Monitoring Program Organizational Chart



A5. Problem Definition/Background and Project Objective

The Pebble Project is a proposed mine for gold, copper, molybdenum, and silver located in southwestern Alaska, north of Lake Iliamna. PLP is conducting baseline environmental studies at the Pebble Project, including meteorological monitoring to support air permitting, environmental studies, and mine design objectives. At least two years of meteorological monitoring is anticipated with a primary objective of collecting meteorological data for supporting future air permit applications required for mining activities, construction and/or roadwork at the proposed mine and port sites.

The meteorological data will be collected in accordance with Prevention of Significant Deterioration (PSD) permit requirements and guidance. While construction of the mine and port infrastructure may not require a PSD permit, the PSD-quality meteorological measurements may also be used for air dispersion modeling required for minor permitting.

A6. Project/Task Description

This study will provide at least two years of representative surface meteorological observations for use in air quality dispersion modeling in support of the Pebble Project. The meteorological monitoring program will include seven PSD-quality stations. Four stations are located in the deposit area, approximately 17 miles northwest of Iliamna and three stations are located in the proposed port area, approximately 52 miles east of Iliamna. The stations are named as follows:

Deposit Area Stations

- Pebble 1 station
- Pebble 4 station
- Pebble 5 station
- Pebble 6 station

Proposed Port Area Stations

- Pebble Port station
- Williamsport station
- North Head station

The study will collect at least two years of meteorological data at the Pebble 1, Pebble 4 and Pebble Port stations. The study will also provide at least one year of meteorological monitoring at the Pebble 5, Pebble 6, Williamsport, and North Head stations.

Three other non-PSD meteorological monitoring stations, known as the Pebble 2, Pebble 3, and Pebble 5A stations have been or will be operated in the Pebble area to collect data for

mine design purposes. These non-PSD stations are not included as part of this QAPP because these stations are not intended to provide data for air dispersion modeling.

Table A3 lists the meteorological parameters to be measured and the frequency at which samples will be collected and recorded.

Table A3. Meteorological Monitoring Measurement Parameters

Parameter	Units	Sampling Frequency	Sample Averaging
Wind speed	meters/second (m/s)	1-second	1-hour
Wind direction	Degrees (°)	1-second	1-hour
Temperature 2-meters	degrees Celsius (°C)	1-second	1-hour
Temperature 10-meters	degrees Celsius (°C)	1-second	1-hour
Vertical temperature difference (ΔT)	degrees Celsius (°C)	1-second	1-hour
Relative Humidity	percent (%)	1-second	1-hour
Solar radiation	Watts per square meter (W/m^2)	1-second	1-hour
Barometric pressure	millibar (mb)	1-second[1]	N/A[1]
Precipitation[3]	Millimeters (mm)	N/A[2]	N/A[2]
Evaporation[3]	Millimeters (mm)	1 second	1 minute

1 Instantaneous pressure measurements are sampled once per hour.
2 Instantaneous precipitation measurements are collected by the datalogger and subsequently summed on an hourly basis.
3 Not measured at the Pebble Port, Williamsport, or North Head stations.

The meteorological monitoring sites for the Pebble Project were selected in a manner consistent with PSD criteria for surface meteorological data collection. Figure A2 shows a map of the PLP meteorological monitoring sites located in southwest Alaska. On May 24, 2005, the proposed monitoring sites were visited by Alan Schuler and Gerry Guay of Alaska Department of Environmental Conservation (ADEC), Natasha Greaves and Rob Wilson of the United States Environmental Protection Agency (EPA) Region 10, and Al Trbovich and Steve Mackey of HCG. On this date, all parties concurred that the Pebble 1, Pebble 4, and Pebble Port sites are the best available locations for carrying out meteorological monitoring representative of the areas proposed for development. Greater details of the monitoring site locations and the proximity of the study areas within defined Alaska land use boundaries are provided in Sections B1 and B9, respectively.

The Pebble Project Meteorological Monitoring Program is expected to run at least from August 1, 2005 to December 31, 2008. In 2007 the Pebble Project Meteorological Monitoring Program was changed to a calendar year monitoring year. Annual Data Reports for the Pebble 1 and Pebble Port stations were submitted for the 2005-2006 monitoring year (August 1, 2005 through July 31, 2006). Following the monitoring year change, annual data reports were submitted for the Pebble 1 and Pebble Port stations for the 2006 monitoring year (January 1, 2006 through December 31, 2006) and for the Pebble 1, Pebble 4, and Pebble Port stations for the 2007 monitoring year (January 1, 2007 through December 31, 2007). Annual data reports for all seven PSD stations will be submitted for the 2008 monitoring year (January 1, 2008 through December 31, 2008). Quarterly data summary reports will be submitted no later than 30 days upon the completion of the monitoring quarter and the annual data report will be submitted no later than 90 days upon completion of the monitoring year. Quality assurance audit reports will be included in the annual data report. For purposes of data reporting, the three calendar years of monitoring will be split into monitoring quarters A through D as follows:

2006 Monitoring Year
Pebble 1, Pebble Port

Monitoring Quarter A	Jan/Feb/Mar 2006
Monitoring Quarter B	Apr/May/Jun 2006
Monitoring Quarter C	Jul/Aug/Sep 2006
Monitoring Quarter D	Oct/Nov/Dec 2006

2007 Monitoring Year
Pebble 1, Pebble 4, Pebble Port

Monitoring Quarter A	Jan/Feb/Mar 2007
Monitoring Quarter B	Apr/May/Jun 2007
Monitoring Quarter C	Jul/Aug/Sep 2007
Monitoring Quarter D	Oct/Nov/Dec 2007

2008 Monitoring Year
Pebble 1, Pebble 4, Pebble 5
Pebble 6, Pebble Port, North Head, Williamsport

Monitoring Quarter A	Jan/Feb/Mar 2008
Monitoring Quarter B	Apr/May/Jun 2008
Monitoring Quarter C	Jul/Aug/Sep 2008
Monitoring Quarter D	Oct/Nov/Dec 2008

Personnel working on this project will be selected by the HCG project manager and will be fully qualified, trained, and capable of their assigned tasks. Work schedules will be determined by the HCG project manager and will include:

(a) daily data reviews
(b) site visits every four to eight weeks
(c) semiannual audits and audit reports
(d) quarterly data summaries
(e) annual data reports
(f) as needed maintenance and corrective actions.

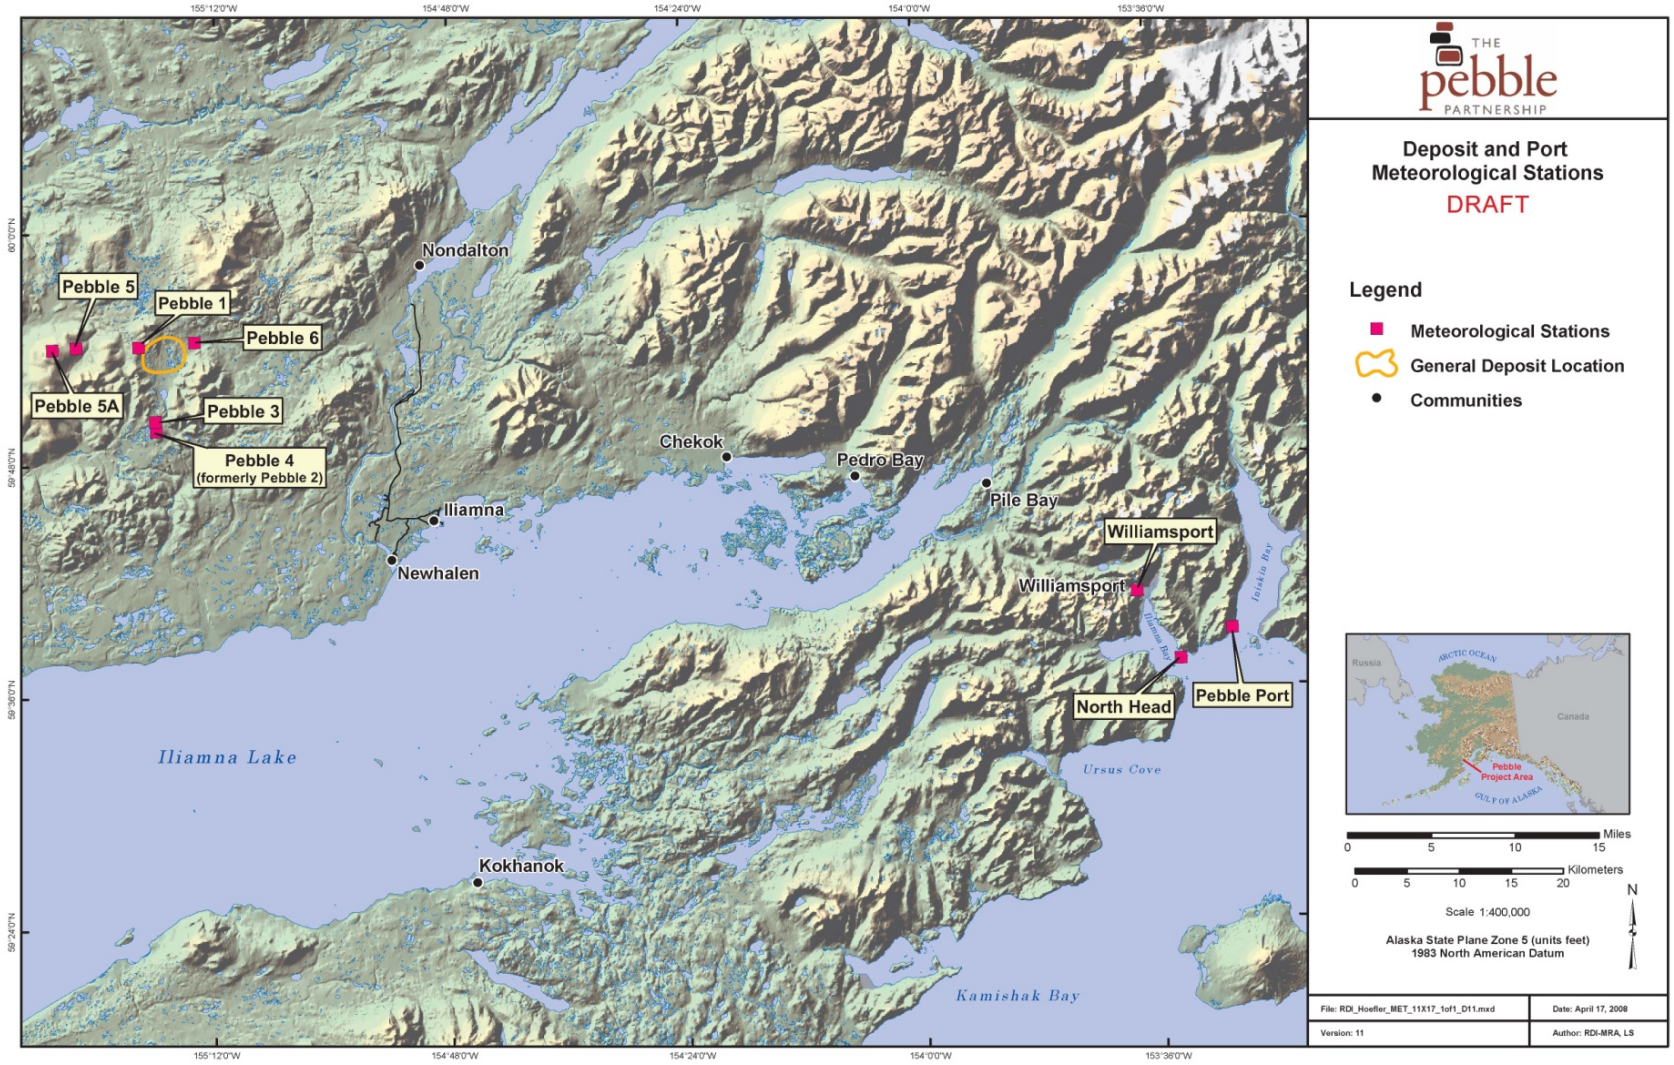
Table A4 provides a provisional work schedule for this monitoring project.

Table A4. Pebble Project Meteorological Monitoring Program Work Schedule

Scheduled Activity	Date
Station Site Selection Visit	May 24, 2005
Installation of Pebble 1 and Pebble Port Stations	June 2005
Training of Station Operators	June 2005
Pebble 1 and Port PSD Station Initial Systems/Performance Audit and Calibrations	June 11 and June 25, 2005
Start of Validated Data at Pebble 1 and Pebble Port stations[1]	August 1, 2005
Beginning of 2006 Monitoring Year	January 1, 2006
Semiannual Performance Audit and Calibrations	January 15-16, 2006
Pebble 4 Station Installation	June 3-10, 2006
Annual Systems/Performance Audit and Calibrations	July/August 2006
End of 2006 Monitoring Year	December 31, 2006
Beginning of 2007 Monitoring Year	January 1, 2007
Semiannual Performance Audit and Calibrations	January/February 2007
Pebble 5 Station Installation	June 2007
Williamsport Station Installation	July 2007
Annual Systems/Performance Audit and Calibrations	August/September 2007
Pebble 6 Station Installation	August 2007
North Head Station Installation	September 2007
End of 2007 monitoring Year	December 31, 2007
Beginning of 2008 Monitoring Year	January 1, 2008
Semiannual Performance Audit and Calibrations	February-April 2008
Annual Systems/Performance Audit and Calibrations	August/September 2008
End of 2008 Monitoring Year	December 31, 2008

[1] Monitoring year scheduled was changed to a calendar year system beginning in 2006.

Figure A2. Pebble Project Area Map



A7. Quality Objectives and Criteria for Measurement of Data

Measurement Quality Objectives (MQOs) and acceptance criteria for the project are defined by the MQOs as prescribed in *EPA Meteorological Monitoring Guidance for Regulatory Modeling Applications,* Sections 3 and 5 (EPA-454/R-99-005), and by the guidelines defined in *EPA Requirements for Quality Assurance Project Plans* Chapter 3, Section A7 (EPA QA/R-5).

Data completeness is a measure of the amount of data actually collected compared with the amount of data that could have been collected, expressed as a percentage. Data completeness for the meteorological sensors is calculated by dividing the number of valid hours of data by the total number of hours during the monitoring period. The Data Quality Objective (DQO) for data completeness during this monitoring project is 90 percent data capture per quarter for every parameter listed in Table A5.

DQOs for the detection capabilities of the meteorological sensors are defined in terms of measurement resolution. The resolution DQOs for this project have been set equal to those put forth in *Meteorological Monitoring Guidance for Regulatory Modeling Applications* Section 5.1 (EPA-454/R-99-005), and are presented in Table A5.

Accuracy is a measure of the proximity of the measurements and the true value. Accuracy includes components of both random error and systematic error associated with instrumental bias. Accuracy will be assessed during performance audits. The accuracy DQOs for the meteorological sensors are presented in Table A5, and have been set equal to those recommended in *Meteorological Monitoring Guidance for Regulatory Modeling Applications,* Section 5.1 (EPA-454/R-99-005).

Detectability, method/comparability, and representativeness are determined by the siting and exposure of the meteorological tower and sensors. The space-time domain and aspects for this specific application--as prescribed in *Meteorological Monitoring Guidance for Regulatory Modeling Applications,* Section 3.1.1 Objective for Siting (EPA-454/R-99-005)--have been considered for each measurement parameter.

Meteorological data collected at this station will be examined and compared to nearby National Weather Service locations (e.g. Iliamna) to ensure that data are consistent with current and historical conditions in the area

Table A5. Summary of DQOs for the Pebble Project Meteorological Monitoring Program

Meteorological Parameter/ Manufacturer and Model	Measurement Method	Manufacturer Specified Accuracy	EPA Required Accuracy[1]	EPA Required Resolution[1]	Detectability/ Data Completeness[1]
Wind Speed (Climatronics F460)	Three-cup anemometer	± 0.07 m/s or ± 1%	± 0.2 m/s or ± 5%	0.1 m/s	90% per monitoring quarter
Wind Direction (Climatronics F460)	Light-weight vane	± 2 degrees	± 5 degrees	1.0 degree	90% per monitoring quarter
Wind Speed (RM Young 05305-AQ)	Light-weight propeller	± 0.2 m/s	± 0.2 m/s or ± 5%	0.1 m/s	90% per monitoring quarter
Wind Direction (RM Young 05305-AQ)	Light-weight vane	± 3 degrees	± 5 degrees	1.0 degree	90% per monitoring quarter
Ambient Temperature & Vertical Temperature Difference (Met One 062MP)	Solid state Thermistor	± 0.05°C	± 0.5°C (Ambient Temperature), ± 0.1°C (Temperature Difference)	0.1°C (Ambient Temperature), 0.02°C (Temperature Difference)	90% per monitoring quarter
Barometric Pressure (Vaisala PTB101B)	Silicon capacitive sensor	± 0.3 mb	± 3 mb	0.5 mb	90% per monitoring quarter
Relative Humidity (Vaisala HMP45C)	Thin-polymer capacitor	± 2% (0-90% range) ± 3% (90-100% range)	± 1.5°C	0.1°C	90% per monitoring quarter
Solar Radiation (Licor LI200X)	Silicon photovoltaic detector	± 5%	± 5%	10 W/m^2	90% per monitoring quarter
Precipitation (ETI NOAH II)	Water pressure	± 0.25 mm	± 5 mm	0.3 mm	90% per monitoring quarter
Evaportation (Nova Lynx 255-100)	Float mechanism/ sensor	± 0.25%	n/a[3]	n/a[3]	90% per monitoring quarter

[1] Referenced in *Meteorological Monitoring Guidance for Regulatory Modeling Applications* (EPA-454/R-99-005).
[2] Values are given in terms of dew point temperature in guidance document (EPA-454/R-99-005).
[3] n/a = not applicable.

A8. Training and Certifications

The Pebble Project meteorological monitoring sites require no specific mandated training requirements as stated in *EPA Requirements for Quality Assurance Project Plans* Section A8 (EPA QA/R-5). However, a site-specific health and safety plan was developed in accordance with both HCG and PLP standards. Site-specific training for this project covers activities performed in the field and includes record keeping practices. All HCG and PLP field personnel will attend annual site safety and logistics meetings hosted by PLP. HCG field technicians for this project will receive training on the operation and maintenance of the meteorological sensors and related equipment. Training will be conducted by the HCG project manager or his designees. Site-specific training checklists and site visit memos will document the specific training received by each Field Technician (Appendix B). These documents will be filed and maintained in the project files.

All personnel working on any element of this project will have their qualifications reviewed and will be determined to have sufficient experience and knowledge in both meteorological monitoring and data processing. Experience and qualifications of key project participants are presented in Appendix D.

A9. Documents and Records

Documentation and records for this project will include equipment calibration and maintenance records, documentation of quality control/quality assurance activities, routine monitoring data, corrective action and resolution forms, any QAPP revision documentation, and records of HCG field activities (i.e. site visit memos). Appendix B includes example data sheets for the monitoring project. All hard-copy documentation will be stored at the HCG Anchorage office and retained for a period of at least five years from the completion of the project. Electronic data will be stored on various media with full project backups. In addition to any written reports, electronic data collected for this project and data transferred to electronic format will be provided to PLP via CD-ROM or e-mail. Both the original comma delimited raw text file and a spreadsheet format file will be provided.

The final annual reports will be submitted to ADEC and PLP in both hard copy and electronic (PDF) format within 90 days of the conclusion of the monitoring program. Validated data will be submitted to ADEC in the same formats. The annual report will include a brief discussion of any monitoring phenomena, observable trends, quarterly and annual averages for all the measured parameters, statistical summaries for each collected parameter, and wind rose graphics. The reports will also contain any additional documentation, including but not limited to equipment calibration and maintenance records, documentation of quality control/quality assurance activities, routine monitoring data, project data reports, corrective action records, and records of field activities. See Section C for an outline of the annual report.

In accordance with ADEC reporting guidelines, quarterly data summaries and annual data reports will be prepared by HCG and provided to PLP and ADEC. The annual data report will be prepared by HCG in accordance to the requirements set forth in *PSD Quality Ambient Air Quality & Meteorological Monitoring Annual Data Report Format* (ADEC, October 2006). In addition, quarterly data summaries will be prepared by HCG in accordance with the format described in *PSD Quality Ambient Air Quality & Meteorological Monitoring Quarterly Data Summary Format* (ADEC, April 2008) and provided to PLP and ADEC within 30 days after the completion of each calendar quarter.

B. Measurement and Data Acquisition

B1. Sampling Process Design

The identified objectives of the Pebble Project Meteorological Monitoring Program are:

- Collect meteorological data necessary to support air permit applications
- Collect data for other environmental purposes (baseline, NEPA)
- Collect data for engineering design of mine and port facilities

To accomplish the monitoring objectives, baseline meteorological monitoring is being performed in both the deposit area (four stations) and near the proposed port site (three stations). The monitoring study is comprised of seven PSD quality meteorological monitoring stations, each of which will collect hourly meteorological monitoring data over a period of at least two years. The seven PSD stations are designed and operated to meet the data quality objectives previously outlined in Section A7 of this QAPP.

B1.1 Monitoring Site Locations

The Pebble Project area is located near Iliamna in southwestern Alaska. The four deposit area stations are located approximately 17 miles northwest of Iliamna and the three port stations are located approximately 52 miles east of Iliamna on Iliamna Bay and Iniskin Bay. The specific station locations are shown in Figure A2.

The meteorological monitoring program consists of a total of seven PSD quality meteorological monitoring stations named as follows:

Deposit Area Stations

- Pebble 1 station
- Pebble 4 station
- Pebble 5 station
- Pebble 6 station

Proposed Port Area Stations

- Pebble Port station
- Williamsport station
- North Head station

Additional non-PSD meteorological monitoring stations are being used to collect data for mine design purposes. One of these non-PSD station was initially located at the Pebble 4 station site from October 2004 through November 2005, and was called the “Pebble 2” station. During November 2005, the Pebble 2 station was relocated 0.6 miles north and

renamed “Pebble 3”. Another non-PSD station, Pebble 5A, was installed on Koktuli Ridge during June 2007. Table B1 provides a summary of the location, purpose, and measurement parameters of PSD and non-PSD meteorological monitoring stations for the Pebble Meteorological Monitoring Program. Throughout the remainder of this QAPP, emphasis will be placed on the locations and operation of the PSD meteorological monitoring stations only, because the primary purpose of these stations is to provide measurements for air dispersion modeling and air permit applications.

Figure B1 shows a map of the meteorological stations adjacent to the Pebble Project deposit location, approximately 17 miles northwest of Iliamna, Alaska. Figures B2 through B5 provide higher resolved maps of the Pebble 1, Pebble 4, Pebble 5, and Pebble 6 station locations. The Pebble 1 station is located at a northern edge of a hilltop at 1,600 feet above sea level and overlooks a basin to the west where the Pebble Project ore body is located. The Pebble 4 station is located at 1,200 feet above sea level and overlooks the Pebble 3 station (at 1,000 feet above sea level) and the drainage of Frying Pan Lake. The Pebble 5 station is located at 1,400 feet above sea level in the North Fork Koktuli Basin. The Pebble 6 station is located at 800 feet above sea level 5 km east of the Pebble 1 station in the Upper Talarik Basin.

Figures B6 and B7 are photos of the Pebble 1 station and the surrounding area in the four cardinal directions, respectively. Figures B8 and B9 provide photos of the Pebble 4 station and the surrounding area in the four cardinal directions. Figures B10 and B11 provide photos of the Pebble 5 station and the surrounding area in the four cardinal directions. Figures B12 and B13 provide photos of the Pebble 6 station and the surrounding area in the four cardinal directions. Despite the relatively low elevation of the sites, all of the meteorological stations sit above tree line and are free of natural and man-made obstructions.

Figure B14 is a map of the proposed port area stations. Figure B15 and B16 are photos of the Pebble Port station and the surrounding area in the four cardinal directions, respectively. The Pebble Port station overlooks the western shores of Iniskin Bay at the site of the proposed Pebble Project shipping port. Figures B17 and B18 are photos of the Williamsport station and the surrounding area in the four cardinal directions respectively. The Williamsport station is located in the northern part of Iliamna Bay where Williams Creek meets the bay. Figures B19 and B20 are images of the North Head station and the surrounding area in the four cardinal directions. The North Head station overlooks the eastern shore of Southern Iliamna Bay.

Table B1. Summary of Pebble Project Meteorological Stations

Station Name	Purpose/ Function[1]	Station Coordinates and Elevation	Monitoring Period	Measured Meteorological Parameters
Pebble 1	PSD quality meteorological monitoring for proposed mine site	59° 54' N 155° 20' W 1,600 feet	Aug. 1, 2005 – Dec. 31, 2008	Wind speed Wind direction Wind sigma Temperature ∆ Temperature Solar radiation Barometric pressure Precipitation Evaporation
Pebble 2	Non-PSD meteorological monitoring at the proposed mine tailings storage facility site	59° 50' N 155° 18' W 1,200 feet	Jan. 2005 – Nov. 2005	Wind speed Wind direction Wind sigma Temperature Precipitation Evaporation
Pebble 3	Non-PSD meteorological monitoring at the proposed mine tailings storage facility site	59° 50' N 155° 18' W 1,000 feet	Nov. 2005 – July 2008	Wind speed Wind direction Wind sigma Temperature Precipitation
Pebble 4	PSD quality meteorological monitoring at the proposed mine tailings storage facility site	59° 50' N 155° 18' W 1,200 feet	Jan. 1, 2007 – Dec. 31, 2008	Wind speed Wind direction Wind sigma Temperature ∆ Temperature Solar radiation Barometric pressure Precipitation Evaporation
Pebble 5	PSD quality meteorological monitoring at the proposed mine tailings storage facility site	59° 54' N 155° 26' W 1,400 feet	Jan. 1, 2008 – Dec. 31, 2008	Wind speed Wind direction Wind sigma Temperature ∆ Temperature Solar radiation Barometric pressure Precipitation Evaporation

[1]Each PSD station measures winds at approximately 10-meters height and is operated in accordance to *Meteorological Monitoring Guidance for Regulatory Modeling Applications* (EPA-454/R-99-005). Non-PSD stations measure wind at 3-meters height and are operated primarily for engineering design.

Table B1 (Continued). Summary of Pebble Project Meteorological Stations

Station Name	Purpose/ Function[1]	Station Coordinates and Elevation	Monitoring Period	Measured Meteorological Parameters
Pebble 5A	Non-PSD meteorological monitoring at the proposed mine tailings storage facility site	59° 54' N 155° 29' W 2,300 feet	Aug. 1, 2007 – Dec. 31, 2008	Wind speed Wind direction Wind sigma Temperature Δ Temperature
Pebble 6	PSD quality meteorological monitoring for proposed mine site	59° 54' N 155° 12' W 800 feet	Jan. 1, 2008 – Dec. 31, 2008	Wind speed Wind direction Wind sigma Temperature Δ Temperature Solar radiation Barometric pressure Precipitation Evaporation
Pebble Port	PSD quality meteorological monitoring at a proposed port site	59° 39' N 153° 28' W 40 feet	Aug. 1, 2005 – Dec. 31, 2008	Wind speed Wind direction Wind sigma Temperature Δ Temperature Solar radiation Barometric pressure
Williamsport	PSD quality meteorological monitoring at a proposed port site	59° 41' N 153° 38' W 40 feet	Jan. 1, 2008 – Dec. 31, 2008	Wind speed Wind direction Wind sigma Temperature Δ Temperature Solar radiation Barometric pressure
North Head	PSD quality meteorological monitoring at a proposed port site	59° 37' N 153° 34' W 90 feet	Jan. 1, 2008 – Dec. 31, 2008	Wind speed Wind direction Wind sigma Temperature Δ Temperature Solar radiation Barometric pressure

[1]Each PSD station measures winds at approximately 10-meters height and is operated in accordance to *Meteorological Monitoring Guidance for Regulatory Modeling Applications* (EPA-454/R-99-005). Non-PSD stations measure wind at 3-meters height and are operated primarily for engineering design.

B2. Sampling Methods Requirements

Measurements will be performed using appropriate monitoring methods to ensure that the data are representative of actual conditions. The following sections address the methods to be used throughout the Pebble Project meteorological monitoring program, instrument installation, and the operational environment of the instruments.

B2.1 Reference and Equivalent Methods

Sensors for the measurement of wind speed, wind direction, ambient temperature, vertical temperature difference, barometric pressure, relative humidity, solar radiation, precipitation, and evaporation will be used to collect meteorological data. Table B2 lists the sensors that will be used, in addition to the manufacturers' specifications and the recommended performance specifications stated in *Meteorological Monitoring Guidance for Regulatory Modeling Applications* (EPA-454/R-99-005). These sensors will be continuously operated throughout this meteorological program.

Ambient temperature sensors will be mounted at 2 and 10 meters above ground level and used to measure vertical temperature difference, ΔT ("Delta T"). Two collocated wind speed and wind direction sensors will be mounted at 10 meters above ground level. The two wind measurement systems will include: (1) Climatronics F460 sensors as the primary wind sensors, and (2) RM Young 05305-AQ wind monitors as the secondary or back-up wind sensors. These dual wind sensors will provide redundancy in the case of data loss. Solar radiation, relative humidity, and barometric pressure measurements will be measured at 4, 2, and 1.5 meters above ground level, respectively. At the Pebble 1, Pebble 4, Pebble 5, and Pebble 6 stations, the evaporation gauge will be mounted on a leveled deck and surrounded with fencing to avoid animal disturbance. The Pebble 1, Pebble 4, Pebble 5, and Pebble 6 station precipitation gauges will be mounted inside Wyoming-type (see Figure B4) and Alter Shield-type wind screens to prevent blowing snow and excessive winds from causing spurious readings and to improve catch efficiency. Complete descriptions of sensor audit and calibration methods are located in Appendix C.

Table B3 lists the sampling and averaging times for all of the meteorological variables that will be collected throughout this project. Wind speed, wind direction, temperature, solar radiation, evaporation pan level, and relative humidity will be sampled every second, and will be used to determine the mean hourly values of the measured parameters. Discrete precipitation values will be recorded to the datalogger each time the precipitation sensor detects a signal, and subsequently processed to provide measurements of total precipitation per hour. In addition, instantaneous measurements of barometric pressure will be sampled once every hour.

Table B2. Summary of Meteorological Sensors and Performance Specifications

Meteorological Parameter	Measurement Method	Sensor Characteristics	Manufacturer Specification	Guidance Document
Wind Speed - Primary (Climatronics F460)	Three-cup anemometer	Max Operating Range	0 - 65 m/s	0 - 50 m/s
		Starting Speed	0.22 m/s	0.5 m/s
		Accuracy	± 0.07 m/s or 1%	± 0.2 m/s + 5%
		Temperature Range	-40 ºC to +60 ºC	Not Specified
		Distance Constant	Less than 4.0 m (13.1 ft)	5 m
		Measurement Resolution	0.01 m/s	0.1 m/s
Wind Direction - Primary (Climatronics F460)	Precision low-torque potentiometer	Azimuth	0 - 360º	Not Specified
		Starting Speed[1]	0.22 m/s	0.5 m/s
		Accuracy	± 2º	± 5º
		Damping Ratio[1]	>0.4	0.4 to 0.7
		Delay Distance	< 1 m (3.3 ft)	5 m
		Temperature Range	-40 ºC to +60 ºC	Not Specified
		Measurement Resolution	0.1º	1.0º
Wind Speed - Secondary (RM Young 05305-AQ)	Propeller type anemometer	Max Operating Range	0 - 40 m/s	0 - 50 m/s
		Starting Speed	0.4 m/s	0.5 m/s
		Accuracy	± 0.2 m/s or 1%	± 0.2 m/s + 5%
		Temperature Range	-50 ºC to +50 ºC	Not Specified
		Distance Constant	2.1 m	5 m
		Measurement Resolution	0.01 m/s	0.1 m/s
Wind Direction - Secondary (RM Young 05305-AQ)	Precision low-torque potentiometer	Azimuth	0 - 360º	Not Specified
		Starting Speed	0.5 m/s	0.5 m/s
		Accuracy	± 3º	± 5º
		Damping Ratio	>0.4	0.4 to 0.7
		Delay Distance	1.2 m	5 m
		Temperature Range	-50 ºC to +50 ºC	Not Specified
		Measurement Resolution	0.1º	1.0º
Ambient Temperature and Δ T Met One 062-MP	Solid state thermistor	Accuracy	± 0.05 ºC	± 0.1 ºC
		Time Constant	3.6 sec	1 min
		Temperature Range	-50 ºC to +50 ºC	-40 ºC to +60 ºC
Solar Radiation (Li-Cor LI200X)	Silicon photovoltaic detector	Accuracy	± 5 %	± 5 % of observed
		Time Constant	1 sec	5 sec
		Spectral Response[2]	400 nm to 1,100 nm	285 nm to 2,800 nm
		Temperature Range	-40 ºC to +65 ºC	-20 ºC to +40 ºC
Barometric Pressure (Vaisala PT101B)	Silicon capacitive absolute pressure sensor	Accuracy	± 0.5 mb	± 3 mb
		Temperature Range	-40 ºC to +60 ºC	Not specified
		Measurement Resolution	< 0.5 mb	0.5 mb
		Measurement Range	600 – 1,060 mb	Not specified

[1] At 10º initial angle of attack

[2] Guidance document allows photovoltaic pyranometers when data will be used to estimate stability.

Table B2 (Continued). Summary of Meteorological Sensors and Performance Specifications

Meteorological Parameter	Measurement Method	Sensor Characteristics	Manufacturer Specification	Guidance Document
Relative Humidity (Vaisala HMP45AC)	Capacitance change of a polymer thin film capacitor	Accuracy	± 2 % RH	± 1.5ºC [3]
		Time Constant	15 sec	30 min
		Temperature Range	-40 ºC to +60 ºC	-30 ºC to +30 ºC
		Measurement Resolution	0.1 % RH	0.1 ºC [3]
		Measurement Range	0-100% RH	-30 ºC to +30 ºC
Precipitation (ETI NOAH II)	Pressure of water column above a load cell mechanism	Accuracy	± .254 mm	± 0.5 mm
		Temperature Range	-30 ºC to +50 ºC	Not specified
		Measurement Resolution	± 0.254 mm	0.3 mm
		Measurement Range	0 to 12 in	Not specified
Evaporation (Nova Lynx 255-100)	Change in pressure head determined by float mechanism	Accuracy	± 0.25% over 10" range	Not specified
		Time Constant	1 sec	
		Temperature Range	0 ºC to 60 ºC	
		Measurement Resolution	1.0 mm	
		Measurement Range	3 to 10 in	

[3] Guidance document specifies values for dew point, not relative humidity.

Table B3. Sampling and Averaging Times for Meteorological Parameters

Meteorological Parameter	Sampling time	Averaging time
Wind Speed	1 sec	1 hr
Wind Direction	1 sec	1 hr
Wind Sigma	1 sec	1 hr
Temperature	1 sec	1 hr
∆ Temperature	1 sec	1 hr
Solar Radiation	1 sec	1 hr
Relative Humidity	1 sec	1 hr
Evaporation	1 sec	1 min
Precipitation[1]	n/a	n/a
Barometric Pressure[2]	1 hr	n/a

[1] Instantaneous precipitation measurements are collected by the datalogger and subsequently summed on an hourly basis.
[2] Instantaneous pressure measurements are sampled once per hour.

B2.2 Environmental Controls

Weatherproof enclosures and/or structures will be installed at each monitoring site for protection of the datalogger, batteries, modem, and barometric pressure sensor. Each monitoring station will be properly grounded to prevent damage from possible lightning strikes. To assure accurate temperature data, each temperature sensor will be mounted within identical fan-aspirated solar radiation shields.

B3. Sample Handling and Custody

Not applicable. No physical samples will be taken as part of this project.

B4. Analytical Methods Requirements

The meteorological sensors to be used for this project meet the specifications and recommendations in *Meteorological Monitoring Guidance for Regulatory Modeling Applications* (EPA-454/R-99-005) (see Table B2).

B5. Quality Control

Quality Assurance/Quality Control (QA/QC) procedures are required for this project to ensure that the collected meteorological data meet standards of reliability and accuracy. Quality control for this project will follow EPA PSD monitoring requirements presented in *Meteorological Monitoring Guidance for Regulatory Modeling Applications* (EPA-454/R-99-005) and *Ambient Monitoring Guidelines for Prevention of Significant Deterioration (PSD)* (EPA 450/4-87-007).

All monitoring equipment will be acquired from manufacturers whose equipment meets EPA meteorological monitoring guidelines. In no case will inferior equipment be used. The Critical Validation Criteria Table (Table B4) outlines criteria deemed critical to maintaining the integrity of a sample or group of samples. Data that do not meet each and every criterion on the Critical Validation Criteria Table will be invalidated unless compelling reason and justification exist for not doing so. The samples for which one or more of these criteria are not met are invalid unless proven otherwise. The cause for not operating in the acceptable range for each violated criteria will be investigated and future occurrences avoided reducing the likelihood that additional samples will be invalidated.

The QA/QC Operational Evaluations Table (Table B5) outlines criteria that are important for maintaining and evaluating the quality of the data collection system. Violation of a criterion or a number of criteria may be cause for invalidation of the data. The decision to invalidate data will consider other quality control information that may or may not indicate the data are acceptable. Therefore, a sample or group of samples for which one of these criteria is not met is suspect unless other quality control information demonstrates otherwise. The reason for not meeting the criteria will be investigated, mitigated, and/or justified.

The Systematic Issues Table (Table B6) outlines criteria important for the correct interpretation of the data but that do not usually impact the validity of a sample or group of samples. For example, data quality objectives are included in this table. Not meeting these data quality objectives does not invalidate any of the samples, but may impact the error rate associated with the attainment/non-attainment decision.

Table B4. Meteorological Sensors QA/QC Critical Validation Criteria

Meteorological Sensors Critical Validation Criteria			
Criteria	***Acceptable Range***	***Frequency***	***40 CFR Reference EPA QA Guidance***
Standard Reporting Units			
Wind speed	m/s	all data	EPA-454/R-99-005
Wind direction	0-360 degrees		
Temperature	Celsius		
Delta temperature	Celsius		
Barometric pressure	mb		
Solar radiation	W/m^2		
Equipment			
Wind speed sensor	Meets recommended specs in guidance	Purchase	EPA-454/R-99-005
Wind direction sensor			
Temperature sensor			
Delta temperature sensor

Thorough review of entire monitoring system (field, lab, data, ect.)	In compliance with approved QAPP	Once per year and less than 30 days within site start-up	EPA-454/R-99-005

B6. Instrument/Equipment Testing and Inspection/Maintenance

B6.1 Acceptance Testing

Prior to installation, all equipment will be visually inspected to ensure no physical damage exists. After installation, and prior to the beginning of the monitoring period, sensors will be calibrated according to the procedures stated in their respective operating manuals. Acceptance testing procedures will be documented on the appropriate calibration forms (provided in Appendix C). To ensure that the sensors continue to properly operate during the monitoring period, calibration checks of the instruments will be conducted semiannually as outlined in Section C1.1 of this QAPP.

B6.2 Site Surveillance and Equipment Inspection and Maintenance

HCG station operators will visit the monitoring station to inspect the condition of the monitoring equipment every 4 to 8 weeks and as needed. During each visit the following tasks will be conducted:

- Check the tower and sensors for signs of storm damage and/or vandalism;
- Observe the sensors to determine if the units appear to be operational;
- Verify that the wind speed and wind direction sensors are moving freely (which is especially important during periods of freezing rain or snow); and
- Clear snow, ice, or accumulated water from surfaces of sensors.

A check list is used to document work performed during the surveillance visits and will be filed with the site visit memo (Appendix B). In the event that station repairs or modifications become necessary, the HCG project manager will dispatch HCG field personnel to accomplish the necessary work. Table B7 is a list of spare parts for this project that will be stored at the HCG Anchorage office and, in some cases, on site to minimize periods of invalid data collection. HCG staff will review data from the stations at least once every work day to check that meteorological sensors and data acquisition are functioning properly.

B6.3 Preventive Maintenance and Corrective Actions

The procedures and schedule for preventive maintenance outlined in the standard operating procedure (SOP) will be followed for this monitoring program (Appendix C). As needed, the spare parts and/or sensors will be dispatched to the monitoring station for repair or sensor replacement by qualified HCG personnel (see Section A4, Organization Chart).

Table B7. List of Meteorological Equipment Spare Parts

Meteorological Parameter	Manufacturer	Model	Spare Parts
Wind Speed	Climatronics/ RM Young	F460/ 05305AQ	Extra sensor, cups[1], propeller[1], and bearings
Wind Direction	Climatronics/ RM Young	F460/ 05305AQ	Extra sensor, vane[1], and bearings
Ambient Temperature	Met One	062-MP	Spare sensor
Delta Temperature	Met One	062-MP	Pair of matched spare sensors
Barometric Pressure	Vaisala	PT101B	Spare sensor
Relative Humidity	Vaisala	HMP45AC	Spare sensor
Solar Radiation	Li-Cor	LI200X	Spare sensor
Precipitation	ETI	NOAH II	Spare sensor and recommended parts
Evaporation	NovaLynx	255-100	Spare sensor and recommended parts

[1] Stored at HCG Anchorage office and at the monitoring site.

B7. Instrument/Equipment Calibration and Frequency

B7.1 Calibration Frequency

Sensors will be calibrated according to the manufacturers' recommendations by HCG personnel immediately prior to the project start date and on a semiannual basis thereafter. Associated calibration forms, methodology, and calibration SOP are presented in Appendix C.

B7.2 Calibration Equipment

All instruments used for calibrating meteorological sensors will be traceable to a National Institute of Standards and Technology (NIST) transfer standard. Calibration certifications will remain on file at the HCG main office. Specific calibration equipment used, NIST traceability standards, equipment certification frequency, equipment accuracy, and calibration range for each meteorological parameter measured are provided in Table B8. The specifications stated in *Quality Assurance Handbook for Air Pollution Measurement Systems* (EPA-600/R-94/038c, September 1994) and *Meteorological Monitoring Guidance for Regulatory Modeling Applications* (EPA-454/R-99-005), for the calibration parameters are referenced in Table B8 to show compliance with EPA standards.

Table B8. List and Specifications for Calibration Equipment

Meteorological Instrument	Calibration Standard	Calibration Standard Characteristics	Manufacturer Specification	Guidance Document
Wind Speed (Climatronics F460 and RM Young 05305-AQ)	RM Young 18801 Anemometer Drive	Range of calibration	0 to 10,000 rpm	0, 2, 5, 10 m/s
		Range of standard	0 to 10,000 rpm	Not Specified
		Accuracy of standard	1.0 rpm	Not Specified
		Calibration Frequency[1]	annually	annually[2]
		NIST traceability method	via RM Young certification	Not Specified
Wind Direction (Climatronics F460 and RM Young 05305-AQ)	Climatronics F460/ RM Young linearity Test Fixture	Range of calibration	0 to 360º	
		Range of standard	0 to 360º	
		Accuracy of standard	0.75º	
		Calibration Frequency[1]	n/a	n/a
		NIST traceability method		
Ambient Temperature and Delta T (Met One 062-MP)	Control Company Traceable 4000 series thermometer	Range of calibration	-20º to 400º C	-40º to 60º C
		Range of standard	-50º to 150º C	Not Specified
		Accuracy of standard	± 0.001º C	± 0.1 ºC
		Calibration Frequency[1]	annually	annually[2]
		NIST traceability method	via Control Co. certification	Not Specified
Solar Radiation (LiCor LI200X)	Co-located Eppley PSP	Range of calibration[3]	0 to 2000 w/m^2	Not Specified
		Spectral Response[4]	285 to 2800 nm	285 to 2800 nm
		Accuracy of standard	± 0.5 %	± 5 % of observed
		Calibration Frequency[1]	annually	annually[2]
		NIST traceability method	To world radiometric reference via calibration with Eppley Cavity Pyrheliometer	To world radiometric reference
Barometric Pressure (Vaisala PT101B)	Co-located Pretel AltiPlus A2	Range of calibration	Ambient condition check (ACC)	ACC
		Range of standard	728 to 1050 mb	Not specified
		Accuracy of standard	± 1 mb	0.2 %
		Calibration Frequency[1]	annually	annually[2]
		NIST traceability method	via Chinook Engineering certification to Ruska Deadweight tester	Not specified
Relative Humidity (Vaisala HMP45AC)	Co-located Vaisala HMI41	Range of calibration	Ambient condition check (acc)	ACC
		Range of standard	0-100% RH	Not Specified
		Accuracy of standard	± 2 % RH	± 1.5ºC [5]
		Calibration Frequency[1]	annually	annually[2]
		NIST traceability method	via Vaisala Labs certification with Hyrgo M-3 dewpoint meter	Not specified
Precipitation (ETI NOAH II)	NovaLynx 260-2595 Tipping Bucket Rain Gauge Calibrator	Range of calibration	24.66 mm/hr	< 25.0 mm/hr
		Range of standard	0 to 940 ml	n/a
		Accuracy of standard	n/a	Not specified
		Calibration Frequency[1]		n/a
		NIST traceability method		
Evaporation (Nova Lynx 255-100)	Graduated Cylinder	Range of calibration	3"-9" of H_20 in gauge	Not specified
		Range of standard	n/a	
		Accuracy of standard		
		Calibration Frequency[1]		
		NIST traceability method		n/a

Note: All monitoring instrument calibrations performed every six months.
[1] Refers to calibration frequency of calibration standard/instrument.
[2] Guidance document specifies standard calibration per manufactures' specifications.
[3] Calibration range for solar radiation will be specific to the time and day of audit.
[4] Guidance document allows use of photovoltaic pyranometers when data will be used to estimate stability.
[5] Guidance document specifies values for dew point, not relative humidity.

B8. Inspection/Acceptance of Supplies and Consumables

All spare parts inventories will be kept up to date by the data manager. Each new spare part will be accepted with the same procedures mentioned in Section B6. Serial numbers for each spare sensor will be recorded by either the data manager or technicians and filed with the data manager. Upon deployment of a replacement part/sensor by site technicians, the make, model, and serial number will be recorded on a Site Visit and System Check form (see Appendix B) or an equivalent site visit memorandum. Each replacement sensor will be calibrated and a performance audit will be completed by technicians to ensure that the sensor is properly functioning. The make, model, and serial number of the removed sensor, as well as replacement sensor information, will also be recorded on the performance audit form provided in Appendix C.

Consumable supplies are not expected to be necessary for this project.

B9. Non-direct Measurements

B9.1 Climate History

The Iliamna airport provides the only known comprehensive climate data available near the Pebble Project area. The Pebble Project mine area stations are located approximately 17 miles northwest of the Iliamna airport and the Pebble Port station lies approximately 52 miles to the southeast. Figure B21 shows the daily extreme and average high and low temperatures recorded at Iliamna from November 10, 1939 through June 30, 2007. The mean temperature at Iliamna ranges from 3°C (37°F) in January to 30°C (56°F) in July. The record low of -44°C (-47°F) was measured on January 22, 1947 and the record high of 33°C (91°F) was measured on June 27, 1953.

Figure B22 shows the monthly mean precipitation for Iliamna compiled from measurements collected from November 11, 1939 through June 30, 2007. Iliamna experiences the most precipitation in August and September with monthly mean precipitation values of 4.62 inches (117 mm) and 4.32 inches (110 mm), respectively. April is typically the driest month and has a monthly mean of 1.08 inches (27 mm) of precipitation.

Figure B23 shows a wind rose based on data collected by the National Weather Service from January 1, 2005 to December 31, 2007 at the Iliamna airport. Prevailing winds typically blow from the north and east. Because the Pebble Project meteorological stations are positioned at significant distances away from the airport and sit at varying elevations relative to the Iliamna airport and each other, the monitoring sites are expected to experience somewhat different meteorological conditions.

Figure B21. Iliamna Daily Extreme and Average High and Low Temperatures

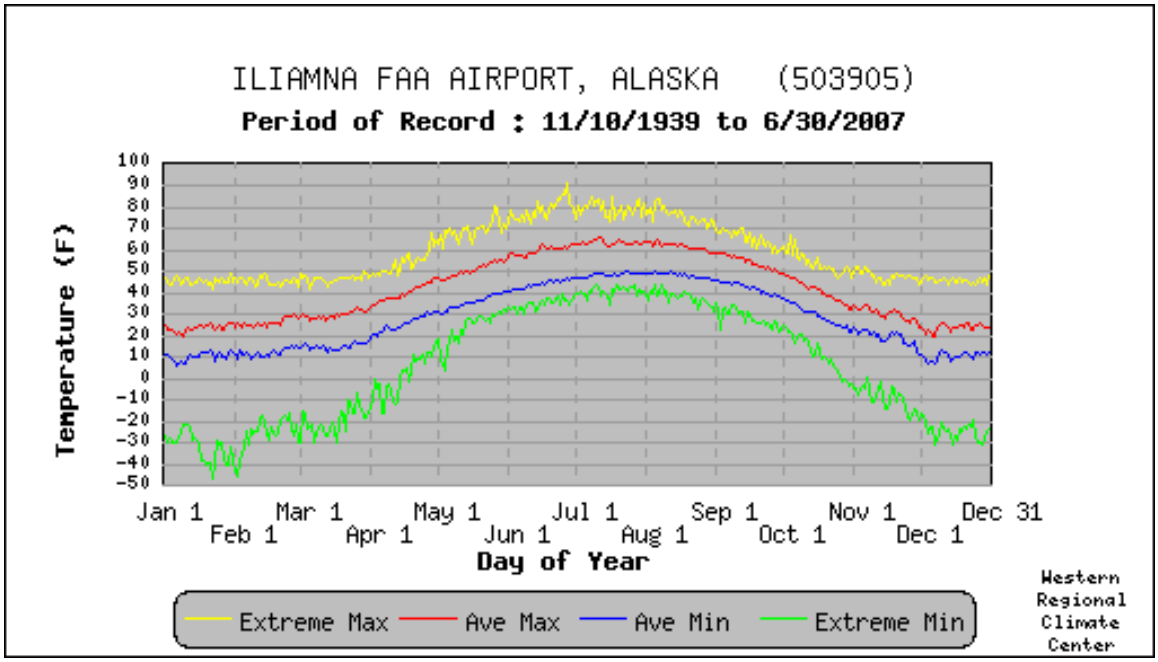

Figure B22. Iliamna Monthly Mean Precipitation

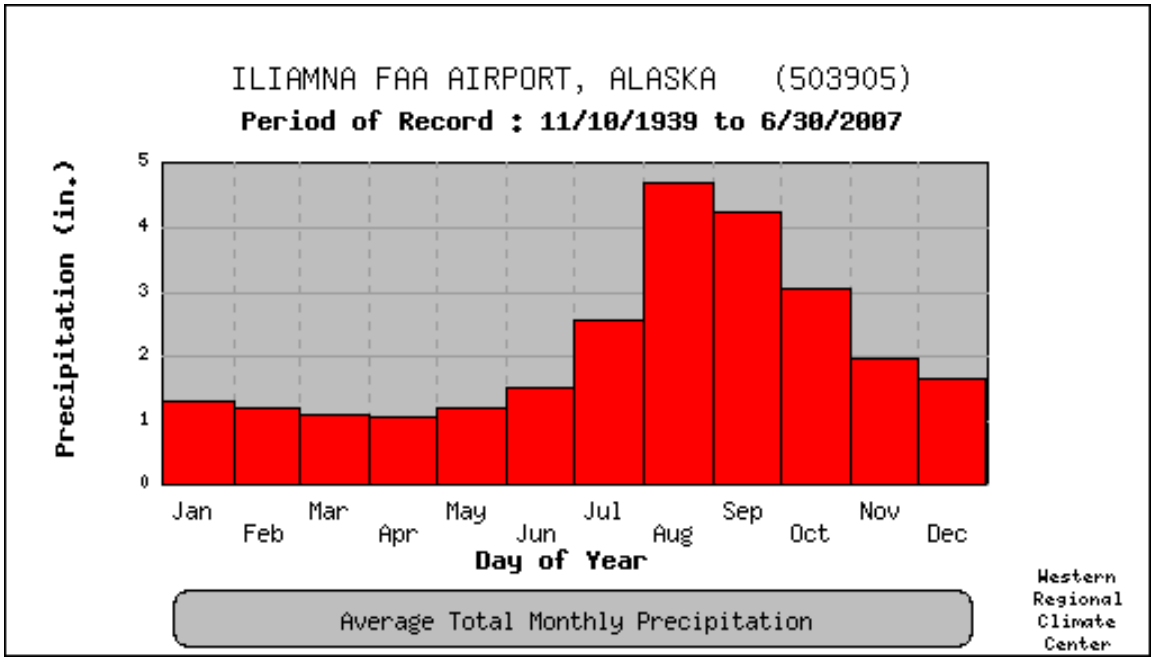

Figure B23. Iliamna Wind Rose

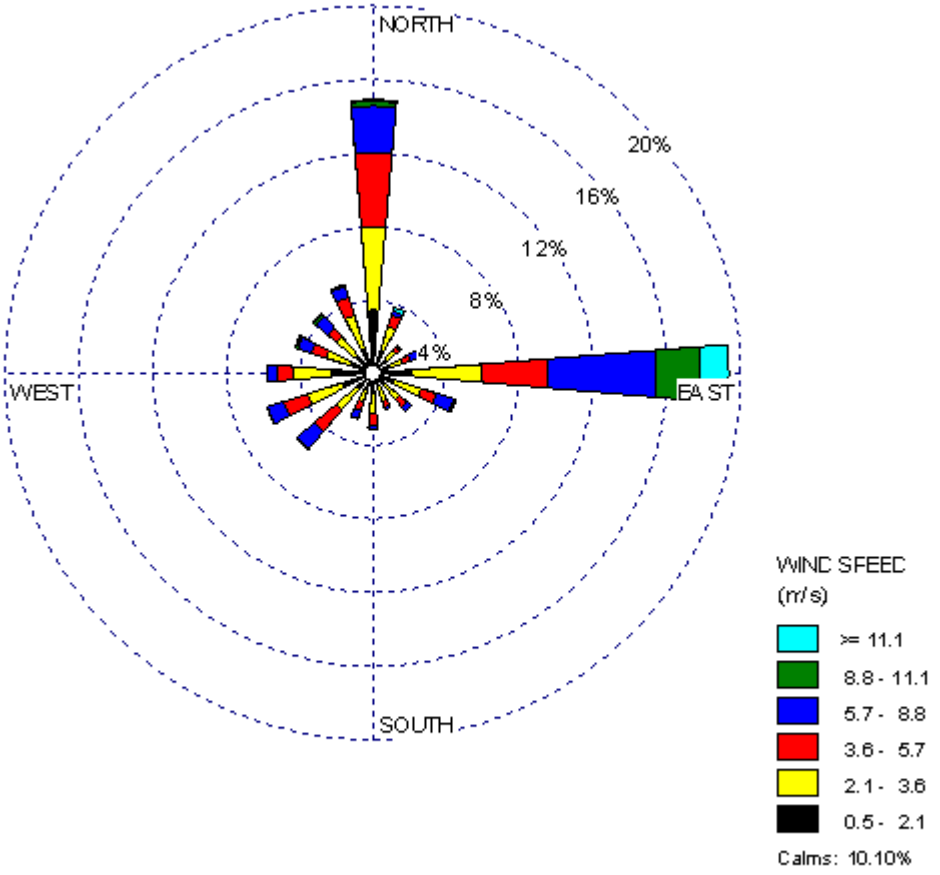
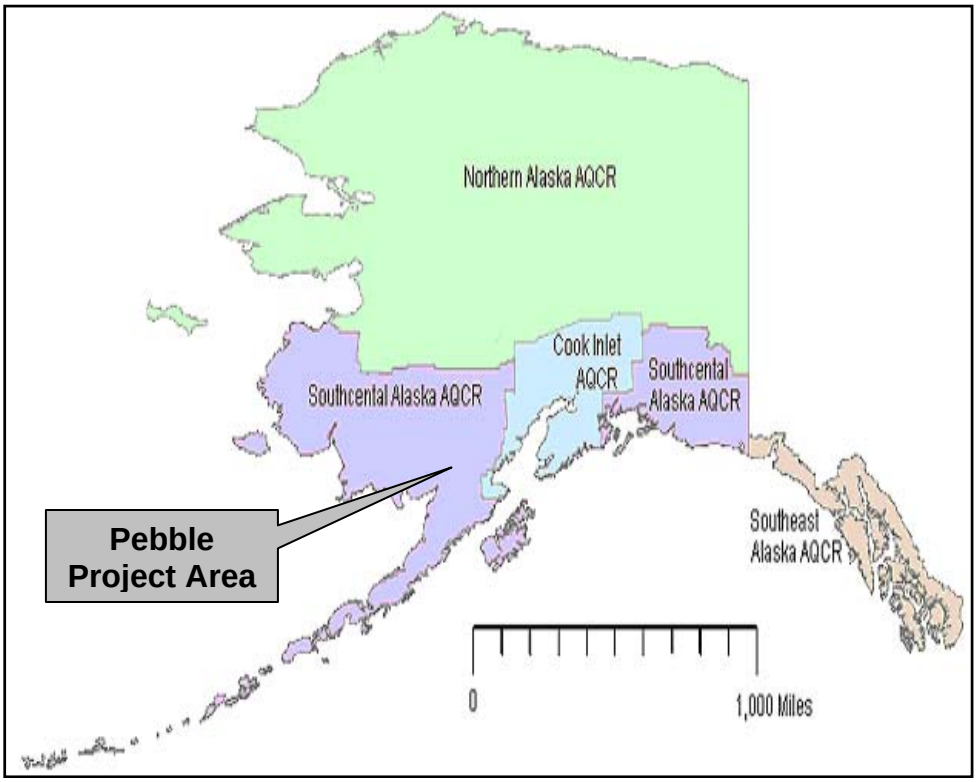


B9.2 Land Use

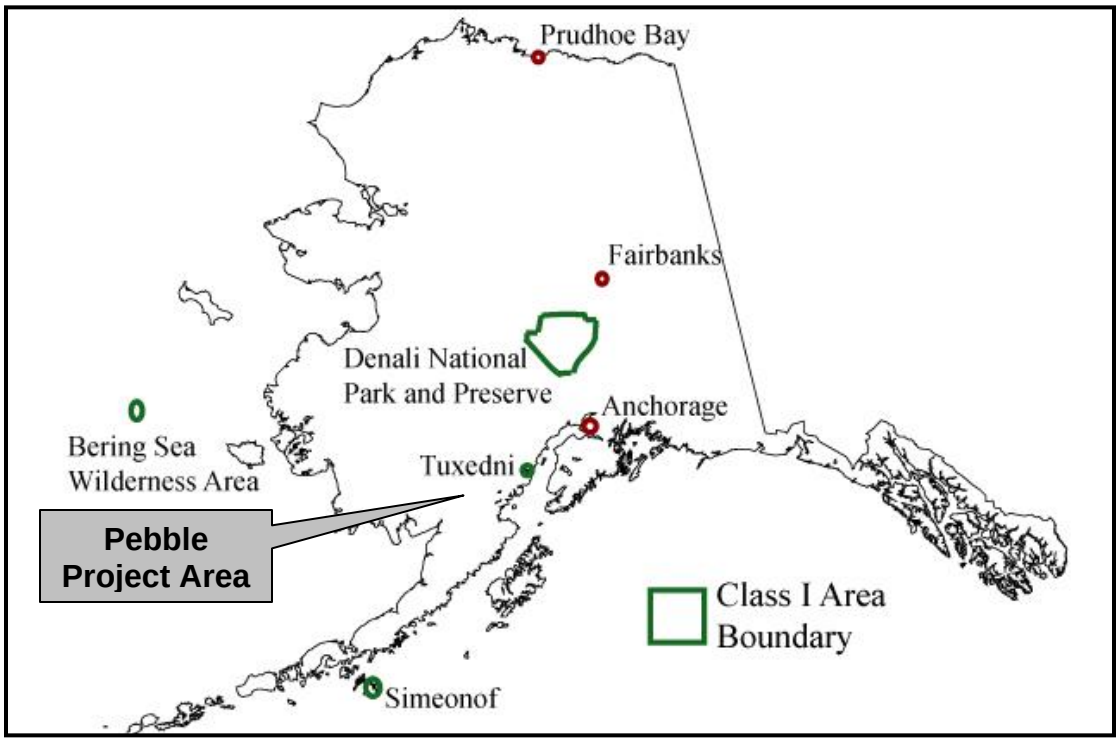
The Pebble Project study area is in a remote region of southwestern Alaska. The Pebble Port location lies within the boundaries of the Cook Inlet Air Quality Control Region (AQCR), as shown in Figure B24. The Pebble Project deposit area lies within the boundaries of the Southcentral AQCR, as shown in Figure B24.

Figure B24. Alaska Air Quality Control Regions



The map in Figure B25 displays the Class I areas in Alaska. The map reference to Denali National Park and Preserve is actually "Denali National Park including the Denali Wilderness but excluding the Denali National Preserve", as per 18 AAC 50.015. The Pebble Project area is within a Class II area and has been designated attainment or unclassifiable for all criteria pollutants. The Tuxedni Wilderness Area is the closest Class I area, and is approximately 50 miles away from the proposed Pebble Port site, and 90 miles away from the Pebble Project deposit area.

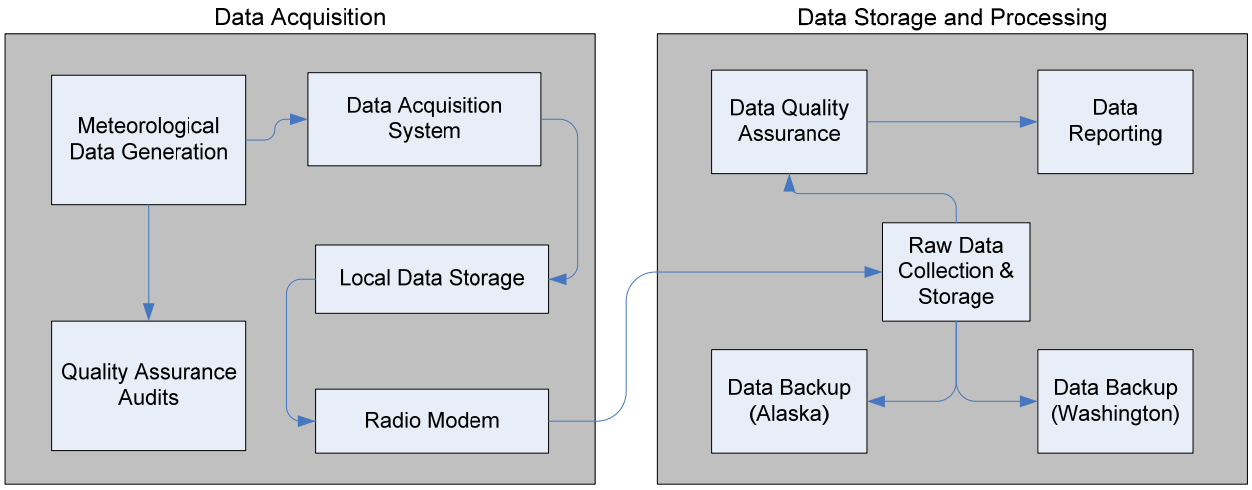
Figure B25. Alaska Class I Areas



B10. Data Management

The proper management of all data associated with this project is critical to assuring the quality and usability of the monitoring results. Therefore, procedures will be implemented to ensure adequate data acquisition, validation, transmission, reduction, reporting, and storage of electronic and hard copy data. Summaries of the procedures to be implemented in the field and in the laboratory for data management are provided in the following sections. Overall data processes illustrated in Figure B26.

Figure B26. Data Processes Flow Chart



B10.1 Data Acquisition

Data acquisition will include the daily collection of electronic data, the generation of hand-written or typed audit and calibration records, and the compilation of previously prepared records (e.g., NIST traceability records). Campbell Scientific CR1000 dataloggers will be used to collect and store the continuous meteorological data. Freewave wireless and SixNet telephone modems will be used to contact the stations remotely via a designated monitoring computer at the HCG Anchorage office. Station data will be downloaded on a daily basis. Field staff and the station auditor will generate written or typed records. These records will be kept according to the prescribed format. Additional records pertaining to this project that have been generated by other organizations will also be collected and stored at the HCG Anchorage main office as necessary.

B10.2 Data Validation

Meteorological data will be reviewed every work day by the HCG station operator or designated qualified personnel and screened using the recommended criteria in *Meteorological Monitoring Guidelines for Regulatory Modeling Applications* (EPA-454/R-99-005), Table 8-4. Site specific Microsoft Access databases and Excel spreadsheets will be used to store, review, and compare data to EPA critical criteria.

During each site visit, HCG Field Technicians will be responsible for verifying the condition of the monitoring site. All site visits will be documented by means of a site visit memo kept with the project files. Alternately, the site visit may be documented in a designated station log book. These field notes will include the following:

- Time, date, current meteorological conditions (e.g., temperature, barometric pressure, sky conditions), and personnel at the monitoring site;
- Activities completed during visit; and
- As-found and as-left observed conditions of monitoring site equipment.

Site audit and visit memo forms are found in Appendix C.

The data manager or their designee will review all records received from the field. Problems or irregularities in the records will be brought to the attention of HCG Field Technicians for further clarification. If the documentation is not sufficiently defensible, the affected data will be invalidated.

B10.3 Data Transmission

Meteorological data will be transmitted daily to the HCG Anchorage office. Collected data will be downloaded to HCG computers for daily data reviews and for data storage. Original forms, check lists, and other records will be stored upon receipt at the HCG main office until the end of the monitoring period. A description of the equipment implemented in the monitoring site telemetry is included in the above section B10.1.

B10.4 Data Reduction

All electronic calculations and statistical analyses will be performed using standard software packages (e.g., MINITAB, Excel, and WRPLOT view) that can be easily verified and audited. Preliminary data reduction to hourly data averages is performed by the datalogger.

B10.5 Data Reporting

Data generated for this project will be routinely summarized and presented to PLP as described in Section C2. Quarterly reports will be prepared and submitted to ADEC within 30 days of the completion of each monitoring quarter. Additionally, an annual data report will be prepared within 90 days upon completion of the monitoring year. The data will also be submitted to ADEC for review and approval in anticipation of using the meteorological data to meet the air dispersion modeling requirements for a minor source air construction permit application.

B10.6 Data Storage

All project documentation, records, data, and reports will be maintained at HCG for a period of at least five years from the completion of the project. Electronic data on the HCG servers are backed up at least once daily and will be archived at a minimum of two separate locations, as well as at the Washington site.

B10.7 Data Use in Modeling

The meteorological data collected during this project will be used for air dispersion modeling using EPA approved AERMOD and CALPUFF models.

C. Assessments and Oversight

C1. Assessments and Response Actions

Data Quality Assessments will be performed on all collected data. Data reviews will be conducted by HCG staff to determine whether the data are reasonable and representative through an independent audit program. Data that are determined to be unreasonable or unrepresentative will be identified, flagged, and discussed in the data reports. The independent audit program for the Pebble Project will consist of semi-annual performance audits and annual systems audits. The audits will be conducted by HCG staff and will be independent of the staff operating the monitoring network. In addition, audits will be conducted using equipment independent of that used for instrument calibrations. The auditor will use a pre-formatted audit form and follow established audit standard operating procedures provided in Appendix C.

C1.1 Performance Audits

Performance audits of the meteorological sensors will be conducted within thirty days of the project start, semi-annually thereafter, and within thirty days of project completion. Performance audits for meteorological sensors will be conducted by collocating independent meteorological sensors with those being used for the monitoring program. The audit sensors will be provided by the station auditor. Performance audits will serve the monitoring program with a measure of quality assurance for meteorological sensors and a means to produce a defensible data set. The performance audits will be conducted in accordance with the procedures outlined in *Meteorological Monitoring Guidance for Regulatory Modeling Applications,* Section 8 (EPA-454/R-99-005). The QA auditor will conduct the performance audits. An outline for the audit equipment and procedures on all meteorological sensors used for this study is listed in Table C1.

C1.2 Systems Audits

In the *Meteorological Monitoring Guidance for Regulatory Modeling Applications,* Section 8 (EPA-454/R-99-005), and *Ambient Monitoring Guidelines for Prevention of Significant Deterioration (PSD)*, Section 7 (EPA-450/4-87-007), EPA recommends that a systems audit be conducted to assess compliance with established regulations governing the collection, analysis, validation, and reporting of meteorological monitoring for PSD. A systems audit is an independent review of program procedures and files to assess conformance to established plans, SOPs, and protocols (see Appendix C). Systems audits for this project will be conducted no later than 30 days after project startup and annually thereafter. The systems audit will evaluate the complete measurement system from data collection through data reporting. The evaluation will also include all off-site data handling and evaluate the management process.

The systems audit is also an on-site qualitative review of the operational procedures of the monitoring program. The audit will ensure that all procedures for the monitoring program (field operations, data reporting, and data management) are being followed and that the data being collected meet the DQOs for the program as described in Section A7. Items reviewed during the systems audit include:

- Quality assurance procedures and documentation;
- Station installation and operation procedures;
- Calibration procedures and documentation for monitoring equipment;
- Documentation of log books and data sheets;
- Completion and documentation of on-site quality assurance procedures; and
- Review of prepared data sets.

After completion of the audit, a debriefing will be conducted with the participants to discuss preliminary audit results. The results of this audit will then be formally compiled in an audit report with observations of strengths and deficiencies, and recommendations for improvements. The audit report will be submitted by the auditor to the PLP and HCG project managers within 30 days. The HCG project manager will ensure that any necessary corrective actions are implemented in a timely manner. Audit forms and further information on system audits are provided in Appendix C.

Table C1. List of Performance Audit Equipment and Procedures

Meteorological Variable	Make/Model	Audit Method	NIST Traceable Audit Tool Used	Frequency of Audit	Procedure
Wind Speed	Climatronics F460/ RM Young 05305-AQ	Synchronous motor comparison	RM Young 18801 Anemometer Drive	Semiannually	See SOP in Appendix C
Wind Direction	Climatronics F460/ RM Young 05305-AQ	Fixed linearity test	Climatronics F460/ RM Young 05305 linearity test fixture	Semiannually	See SOP in Appendix C
Ambient Temperature and Delta T	Met One 062-MP	Co-located temperature immersion bath comparison	Control Company Traceable 4000 series thermometer	Semiannually	See SOP in Appendix C
Solar Radiation	Li-Cor LI200SZ	Co-located sensor comparison	Eppley Labs PSP	Semiannually	See SOP in Appendix C
Barometric Pressure	Vaisala PT101B	Co-located sensor comparison	Pretel Altiplus A2	Semiannually	See SOP in Appendix C
Relative Humidity	Vaisala HMP45ASP	Co-located sensor comparison	Vaisala HMI41	Semiannually	See SOP in Appendix C
Precipitation	ETI NOAH II	Volumetric drip comparison	Nova Lynx 260-2595 Tipping Bucket Rain Gauge Calibrator	Semiannually	See SOP in Appendix C
Evaporation	Nova Lynx 255-100	Water height comparison	Precision Tape Measure	Semiannually	See SOP in Appendix C

C1.3 Corrective Actions

All deficiencies identified during audits, site visits or during data review will be recorded and reported to the project manger no later than seven working days of discovery. Corrective actions to rectify deficiencies will be addressed and documented in a Corrective Action Form (see Appendix B) and on the audit reports. Corrective actions will also be discussed in the annual data reports.

C1.4 QAPP Revisions

Based on the review of the systems audit, it may be necessary to revise this QAPP. The QAPP revisions will address any project deficiencies stated in the system audit. The project manager and permitting manager will make any necessary changes and the revised QAPP will be submitted to ADEC for approval.

The PLP QAPP was first submitted to ADEC August 31, 2006. On December 15, 2006 ADEC provided comments in their report of the findings. In May 2008, the QAPP was revised to reflect the addition of the Pebble 5, Pebble 6, Williamsport, and North Head meteorological stations and to address the comments received from ADEC regarding their review of the QAPP.

C2. Reports to Management

Reports to management are summarized in Table C2. An annual data report will be prepared by HCG and provided to PLP and ADEC within ninety days after the completion of the one year monitoring period. The annual data report will follow the ADEC PSD Quality Monitoring Data Report guidelines. An electronic copy of the validated data in Excel spreadsheet format will be provided with the data reports. This annual report will include the following:

- Data capture statistics for the meteorological sensors;
- Explanations for any missing or flagged data;
- Summaries of maintenance activities;
- Results of calibrations and audits;
- Raw data and calculations used for calibrations and audits; and
- Copies of site visit notes.

The annual data report will follow the ADEC PSD Quality Monitoring Data Report guidelines. An electronic copy of the validated data in Excel spreadsheet format will be provided with the data reports.

Table C2. Summary of Reports to Management

Reports	Frequency	Content	Responsible Individual	Distribution
Quarterly Data Summaries	Quarterly	Accuracy Assessment Summary	Rebecca Van Wyck Data Manager (or others)	See Section A3. Distribution List
Performance Audit Reports	Semiannually	Accuracy Assessment Summary	Eric Brudie QA Auditor	See Section A3. Distribution List
Technical System Audit Report	Annually	Results of the system audit, required corrective actions if needed	Eric Brudie QA Auditor	See Section A3. Distribution List
QA Annual Report	Annually	Summarize data following ADEC format for Annual Reports	Rebecca Van Wyck Data Manager (or others)	See Section A3. Distribution List
Corrective Action Reports	As Needed	Summarizes corrective actions taken to restore station to compliant status	K. Steven Mackey, Project Manager (or others)	See Section A3. Distribution List
Response to Corrective Action Reports	As Needed	Reports the results of the corrective action taken	K. Steven Mackey, Project Manager	See Section A3. Distribution List

D. Data Validation and Usability

D1. Data Review, Validation, and Verification Requirements

D1.1 Data Review

All data review will be done in accordance with EPA method-specific procedures. Method specific data validation tables (Appendix B) shall serve as the basis for this data review. These method specific data validation tables state specific criteria for accepting, rejecting, or qualifying the monitoring data. As meteorological data are periodically received over the monitoring year, the data manager will review the incoming data and make comparisons to the standards discussed in Section B10.2 of this document. During each quarter, the data will be reviewed again by a certified staff meteorologist to ensure that the data are complete, accurate, and representative and that erroneous data have been removed in preparation for the final data report.

Any anomalies or significant events will be flagged and noted on appropriate checklists or in the station logbook. Any suspect data will be brought to the attention of the Project Manager as soon as possible.

All other documentation pertaining to this monitoring project (e.g., trip reports, audit and calibration data sheets) will be reviewed upon receipt to ensure that all forms are completed prior to acceptance and for further use in this project. Table D1 summarizes the data review for this monitoring project.

Table D1. Data Review List for the Pebble Project

Type of Data Generated	Method for Acceptance	Data Review	Review Frequency	Person Responsible for Data Review	Project Specific Calculations
Raw Data	Data Review	Method Specific Data Validation Tables	Daily	Project and data manager	Delta T and Wind Sigma
QA Reviewed Data	Data Review	Method Specific Data Validation Tables	Daily	Project and data manager	n/a
Quarterly Data Summary	HCG permitting manger review	Method Specific Data Validation Tables	Quarterly	Project and data manager	Quarterly data capture statistics
Annual Data Report	HCG permitting manger review	Method Specific Data Validation Tables	Annual	Project and data manager	Quarterly and annual data capture statistics

D1.2 Data Calculations

Meteorological data collected for this project will be used for air dispersion modeling. Atmospheric stability, commonly determined using the solar radiation-delta temperature (SRDT) method, will be calculated using the EPA approved AIRMET Program.

Data completeness for meteorological monitoring methods will be calculated assuming a minimum of 90 percent valid hourly average data to calculate quarterly average data completeness and a minimum of 90 percent quarterly data completeness for four consecutive quarters.

Quarterly data completeness (DC_i) will be determined using the following equation:

$$DC_i = \frac{h_v}{h_i} \times 100$$

Where:

h_v = number of hours of valid data actually collected
h_i = number of possible valid hours of data collection during the monitoring period

Vertical Temperature Difference and Wind Sigma will be computed by the datalogger. Wind Sigma will be calculated using the Yamartino method recommended in *Meteorological Monitoring Guidance for Regulatory Modeling Applications* (EPA-454/R-99-005) provided below:

$$\sigma_A = \sigma_\theta = \arcsin(\epsilon)\,[1 + 0.1547\ \epsilon^3]$$

Where:

$$\epsilon = \left[1 - \left(\overline{\sin(\theta_i)^2} + \overline{\cos(\theta_i)^2}\right)\right]^{\frac{1}{2}}$$

D2. Validation and Verification Methods

Data validation refers to the review process in which data are screened for errors and anomalies. All data for this meteorological monitoring project will be validated only after being screened by the criteria in Table 8-4 of *Meteorological Monitoring Guidance for Regulatory Modeling Applications,* (EPA-454/R-99-005) found in Table D2. All data is examined using a MS Excel Spreadsheet that screens for the EPS PSD criteria outlined in Table D2 and all flagged data is examined by the Project Manager and Data Manager and reported in the Annual Data Report.

Semiannual audits and calibrations will be performed on the station to ensure that all sensors are operating within the tolerances suggested by the manufacturer and the EPA. Equipment audits and calibrations are conducted using NIST traceable equipment to ensure that collected data is traceable to standards of acceptable quality. Station calibration and audit forms can be found in Appendix C. During each site visit, the HCG operator will be responsible for recording any anomalies or significant events and bringing them to the attention of the Data Manager. Copies of the site visit memos will be provided to the Data Manager.

Calibration and Audit Criteria can be found in Section B.5. Station calibration and audit forms can be found in Appendix C.

For this project two types of wind sensors are being used to provide redundant data. The RM Young 05305-AQ wind sensor uses a combined propeller anemometer and vane assembly, and the Climatronics F-460 wind sensor uses a three cup-type anemometer with a separate vane-style wind direction sensor. The RM Young sensor can be somewhat less susceptible to rime ice build-up and is therefore used as a back-up wind measurement sensor. In cases when the Climatronics wind sensor data fails to meet the DQO goal of 90% quarterly data capture, the back-up RM Young wind data will be used, if deemed necessary and applicable. Both the primary and back-up wind sensors will have the same level of quality assurance checks as outlined in Sections B5 and B6.

The Data Manager will review data daily to check for irregularities. Any suspicious data will be investigated using EPA PSD criteria identified in Table D2. Any invalidated data will be discussed in Quarterly and Annual Data Reports. Data validation tables are provided in Appendix B.

Table D2. EPA PSD Data Validation Criteria

Parameter	Flagging Criteria[1]
Wind Speed (10 meters)	Value is < 0 m/s, > 25 m/s
	< 0.1 m/s variation for 3 consecutive hours
	<0.5 m/s variation for 12 consecutive hours
Wind Direction (10 meters)	Value is < 0°, > 360°
	<1° variation over 3 consecutive hours
	< 10° variation over 18 consecutive hours
Temperature (2 and 10 meters)	> 5°C variation from previous hour
	< 0.5°C variation for 12 consecutive hours
	Value is > record high, < record low
Temperature Difference, ΔT	Value is > 0.8°C during the daytime
	Value is < -0.8°C during the night
	Value is > 5°C, < -3°C
Relative Humidity (Dew Point Temperature)[2]	Value is > ambient temperature
	> 5°C variation from previous hour
	< 0.5°C variation for 12 consecutive hours
	Equals ambient temperature for 12 consecutive hours
Solar Radiation	> 0 W/m^2 at night
	Greater than the maximum possible value for date and latitude
Barometric Pressure	> 1060 mb (sea level)
	< 940 mb (sea level)
	> 6 mb variation for 3 consecutive hours
Precipitation	> 25 mm in one hour
	> 100 mm in 24 hours
	< 50 mm in one month

[1]Flagging criteria are based upon Table 8-4 Suggested Data Screening Criteria in *Meteorological Monitoring Guidance for Regulatory Modeling Applications* (EPA-454/R-99-005).
[2]Guidance document provides values in terms of dew point temperature.

D3. Reconciliation with User Requirements

The objective of this monitoring program is to collect surface meteorological data needed for engineering design and environmental purposes, including water balance studies, and for the preparation of the air quality construction permit applications for the mine and port sites. Although the mine and port facilities may not require a PSD permit, PSD-quality data will be collected to support the required computer-based dispersion modeling. HCG will conduct an annual or final review at the completion of the monitoring project and report the results obtained during the reporting period. These reports will be compared to the established DQOs to ensure that the scope of the project has been met.

The reconciliation of data for this project will be determined by the data validation and verification process as discussed in Section D2 of this document and based upon the five step Data Quality Assessment (DQA) plan recommended in *Guidance for Data Quality Assessments* (EPA QA/G-9):

- A review of the DQOs and sampling design will be conducted by the permitting manager to assure meteorological outputs from this program are still applicable. If DQOs have not been developed, the permit manager will specify DQOs before evaluating the data. The permitting manager will also review the sampling design and data collection documentation for consistency with the DQOs.
- A Preliminary Data Review will be conducted by the permitting manager. The manager will review QA reports, calculate basic statistics, and generate graphs of the data. This information will be used to determine data structure and identify patterns, relationships, or potential anomalies.
- A statistical test will be selected that is most appropriate for summarizing and analyzing the data, based on the review of the DQOs, the sampling design, and the preliminary data review. The permitting manager will identify the key underlying assumptions that must hold for the statistical procedures to be valid.
- Given the actual data and other information about the study, the permitting manager will evaluate whether identified assumptions will hold, or whether departures are acceptable.
- Conclusions from the statistical calculations will be evaluated to determine if the monitoring design and its created data meet the required permits for the statistical test. This determination will be documented, as well as the inferences drawn as a result of these calculations. If the design is to be used again, an evaluation will be made on the performance of the sampling design.

If the preliminary data review reveals that data sets are inconsistent with the DQOs, or the underlying assumptions of the statistical test are not supported by the data and fail to meet the criteria/objectives of this monitoring project, then the permit manager and project manager will reconsider the project design as described in this QAPP.

1.0 INTRODUCTION

This Health and Safety Plan is a job-specific document presenting a comprehensive plan for compliance with the Hoefler Consulting Group HSE program. Hoefler Consulting Group (HCG) prepared this plan for the Pebble Project Meteorological Monitoring Program.

The plan incorporates a specific breakdown of the project activities, the planned communication and interface provisions that will be followed for the project. The intent is to summarize the scope of work and the associated health and safety issues with a focus on the needs of field personnel and successful execution of the project.

The established procedures found in the Alaska Safety Handbook (ASH) and the safety manual, *Mineral Exploration in Western Canada* are available as reference documents for implementing best practices for all project work activity and pre-job planning. A Phase Hazard Analysis (PHA) addresses the progressive steps of the project plan and field operations. Changes to a work plan or scope, after the plan is developed, poses significant potential for health and safety related incidents.

ANY CHANGE OF CONDITIONS THAT AFFECT THE PLAN WILL REQUIRE A SAFETY "TIME OUT" TO ASSESS HOW THAT CHANGE WILL IMPACT THE JOB AS PLANNED. WHEN ADDITIONAL HAZARDS ARE INTRODUCED INTO A PLANNED PHASE, CONTROLS WILL BE DISCUSSED WITH ALL PARTIES TO ENSURE SAFE EXECUTION DURING THE SAFETY "TIME OUT."

2.0 SCOPE OF WORK

Two three-meter meteorological stations will be installed and operated at the Pebble Project site. A radio repeating tower is already operating at the project location. Work will include instrument installation, establishing the power supply, and start-up and operation of the monitoring stations. All components are designed for rapid installation of the system in the field.

3.0 PROJECT EXECUTION PLAN

3.1 Phase 1: Mobilization

Mobilization consists of staging all necessary tools and equipment to the site. All equipment and personnel will travel from the base camp to the site via helicopter or snow machine. Prior to commencement of installation, HCG personnel will undergo a site-specific orientation, including familiarization with site facilities and operations personnel. HCG staff will also ensure that the pilot and site manager are aware of their location in the field in the event radio contact is interrupted. A back-up plan for pick-up will be established prior to beginning field work each day.

3.2 Phase 2: Installation

HCG personnel will begin to install equipment upon arrival. Electrical power such as 120 VAC for light hand tools and 12 VDC will be established first. All instrument components are 12 VDC, including heaters, fans, data logger and the cell phone/modem system.

3.3 Phase 3: Operation

Following successful installation of the equipment, initial performance audits and calibrations will be conducted to ensure equipment is operating within EPA and ADEC guidelines. These procedures require approximately one full day of work to complete. Subsequently, the meteorological station will operate unattended for an extended period of time**.** Quarterly audits, calibration, and maintenance will be conducted by HCG staff.

3.4 Phase 4: Demobilization

Demobilization operations consist of packing all tools, safety gear and HCG-owned equipment for transport back to Anchorage. The work area will be cleared of all work-related debris and litter and will be left in an orderly fashion.

4.0 PROJECT SCHEDULE

Installation activities are to be conducted in October 2004 and system upgrades are scheduled to be made in November 2004. Quarterly audits, calibrations and maintenance are scheduled to occur in 2005.

5.0 HAZARD ASSESSMENT

5.1 Health and Safety Risks Identified

The health and safety risks identified for the four defined phases of the project are as follows:

Phase		Personnel	Equipment
Phase 1	Mobilization	Low	Low
Phase 2	Installation	Medium	Medium
Phase 3	Operation	Low	Medium
Phase 4	Demobilization	Low	Low

5.1.1 Phase Hazard Analysis: Phase 1

Project: Pebble Project Meteorological Monitoring

Date: November 2004

Location: Iliamna, Alaska

Phase: Mobilization

Overall Risk Rank: Low

Phase Description: Initial project mobilization of employees, tools, and equipment to installation site.

Activities include:

- Travel to Pebble Project site near Iliamna, Alaska, site-specific orientation, familiarization with site facilities and operations personnel.
- Transporting, lifting, and rigging of tools and equipment.

POTENTIAL HAZARDS		RANK
1.	Lifting hazards	Medium
2.	Muscle strains / overexertion / dehydration / fatigue / hypothermia	Low
3.	Slips or falls from ladder.	Low
4.	Cuts and lacerations-striking against objects, pinch points and protruding objects, trip hazards.	Low
5.	Negative wildlife encounters	Low

Recommended Controls:

1. Ensure crew members understand all project hazards, are familiar with specific lifting equipment used, and utilize proper personal lifting techniques. Follow lifting safe work practices and avoid unsafe work acts. Ensure employees get help to move heavier objects, and utilize move-smart techniques, as well as proper body motion-mechanics when performing physical lifting.

2. Warm up and stretch before lifting or pulling. Drink plenty of water throughout the day. Avoid excessive amounts of coffee, teas, colas, sodas, juices, etc. These liquids will not re-hydrate an individual as well as water. Be prepared for inclement weather. Proper clothing (layered) for outside work activities is essential, and should include at a minimum: thermal underwear, arctic coverall gear, gloves, face mask, heavy socks, appropriately rated cold weather footwear (winter months). Get help with awkward loads. Ensure that employees are given sufficient time to conduct activities at the work site. Do not increase speed of activities. Ensure that employees are given multiple breaks throughout the workday.

3. Ensure footwear is in good repair, and always ensure solid footing. Situate ladders or stepstools on level ground, and use caution when working off the ground. Pay attention to surroundings.

4. Wear proper PPE to prevent personal injury. Anyone working at height will be trained in fall prevention/protection and will be wearing fall protection. Employees are to familiarize themselves with the immediate work area for any given task. Ensure power tools and extension cords are good working order. Visually inspect the equipment before use.

5. Be alert to surroundings. Do not leave food sources out that can attract animals. Carry personal firearms and/or bear mace or be in the company of someone who has firearms and is trained in firearm use.

Note:
A change to a plan after the plan was developed is a major reason for health and safety incidents.

ANY CHANGE OF CONDITIONS THAT AFFECT THE PLAN WILL REQUIRE A SAFETY "TIME OUT" TO ASSESS HOW THAT CHANGE WILL IMPACT THE JOB AS PLANNED. WHEN ADDITIONAL HAZARDS ARE INTRODUCED INTO A PLANNED PHASE, CONTROLS WILL BE DISCUSSED WITH ALL PARTIES TO ENSURE SAFE EXECUTION DURING THE SAFETY "TIME OUT".

Inspections/Audits:
The crew supervisor will review the upcoming work on a daily basis and review a Safety Analysis Form outlining safety procedures, safety equipment usage and the possible hazards associated with the work planned that day. The material will be presented to the crew as a "Tool Box Safety Meeting" prior to the start of work that day.

Possible Crew Members: Dominic Shallies, Jared Cockman, Jeff Frensdorf, Eric Brudie, Steve Mackey

Emergency Action Plan:
Provide first aid. Immediately notify Pebble Partnership Mines officials of the situation.

Additional Comments/Changes:

5.1.2 Phase Hazard Analysis: Phase 2

Project:	Pebble Project Meteorological Monitoring
Date:	November 2004
Location:	Iliamna, Alaska
Phase:	Installation
Overall Risk Rank:	Medium
Phase Description:	The meteorological station tripods will be installed at pre-determined field locations. Power will be connected to the instrumentation.

Activities include:

- Installing towers

- Installing/securing a data logger/controller enclosure at ground level
- Connecting 12 VDC electrical power

POTENTIAL HAZARDS		RISK
1.	Lifting Hazards	Medium
2.	Muscle strains / overexertion / dehydration / fatigue / hypothermia	Medium
3.	Slips or falls from ladder.	High
4.	Cuts and lacerations-striking against objects, pinch points and protruding objects	Medium
5.	Electrocution while connecting power supply	Low
6.	Negative wildlife contacts	Low

Recommended Controls:

1. Ensure crew members understand all project hazards, are familiar with the specific lifting equipment used in installation, and utilize proper personal lifting techniques. Follow lifting safe work practices and avoid unsafe work acts. Ensure employees get help to move heavier objects, and utilize move-smart techniques, as well as proper body motion-mechanics when performing physical lifting.

2. Warm up and stretch before lifting or pulling. Drink plenty of water throughout the day. Avoid excessive amounts of coffee, teas, colas, sodas, juices, etc. These liquids will not re-hydrate an individual as well as water. Be prepared for inclement weather. Proper clothing (layered) for outside work activities is essential, and should include at a minimum: thermal underwear, arctic coverall gear, gloves, face mask, heavy socks, appropriately rated cold weather footwear (winter months). Get help with awkward loads. Ensure that employees are given sufficient time to conduct activities at the work site. Do not increase speed of activities. Ensure that employees are given multiple breaks throughout the workday.

3. Ensure footwear is in good repair, and always ensure solid footing. Situate ladders or step stools on level ground and use caution when working off the ground. Pay attention to surroundings.

4. Wear proper PPE to prevent personal injury. Anyone working at height will be trained in fall prevention/protection and will be wearing fall protection. Employees are to familiarize themselves with the immediate work area for any given task.

5. Ensure power tools and extension cords are good working order. Visually inspect the equipment before use.

6. Be alert to surroundings. Do not leave food sources out that can attract animals. Carry personal firearms and/or bear mace or be in the company of someone who has firearms and is trained in the use of firearms.

Note:
A change to a plan after the plan was developed is a major reason for health and safety incidents.

ANY CHANGE OF CONDITIONS THAT AFFECT THE PLAN WILL REQUIRE A SAFETY "TIME OUT" TO ASSESS HOW THAT CHANGE WILL IMPACT THE JOB AS PLANNED. WHEN ADDITIONAL HAZARDS ARE INTRODUCED INTO A PLANNED PHASE, CONTROLS WILL BE DISCUSSED WITH ALL PARTIES TO ENSURE SAFE EXECUTION DURING THE SAFETY "TIME OUT".

Inspections/Audits:
The crew supervisor will review the upcoming work on a daily basis and review a Safety Analysis Form outlining safety procedures, safety equipment usage and the possible hazards associated with the work planned that day. The material will be presented to the crew as a "Tool Box Safety Meeting" prior to the start of work that day.

Possible Crew Members: Dominic Shallies, Jared Cockman, Jeff Frensdorf, Eric Brudie, Steve Mackey

Emergency Action Plan:
Provide first aid. Immediately notify Pebble Partnership Mines officials of the situation.

Additional Comments/Changes:
Audits and calibrations are scheduled for the spring and fall. These tests, which will involve two HCG personnel, should take one working day to complete. Various personnel will be involved in these site visits.

5.1.3 Phase Hazard Analysis: Phase 3

Project: Pebble Project Meteorological Monitoring
Date: November 2004
Location: Iliamna, Alaska
Phase: Operation
Overall Risk Rank: Low/Medium
Phase Description: Following successful equipment setup, initial audits and calibrations will be conducted. These activities will take approximately one full work day to complete. Subsequently, the meteorological stations should operate unattended for an extended period of time.

Activities Include:

- Initial calibration and audits
- Periodic calibrations and audits

	POTENTIAL HAZARDS	RISK
1.	Lifting Hazards	Low
2.	Muscle strains / overexertion / dehydration / fatigue / hypothermia	Low
3.	Cuts and lacerations-striking against objects, pinch points and protruding objects	Low
4.	Electrocution	Low
5.	Negative wildlife contacts	Low

Recommended Controls:

1. Ensure crew members understand all project hazards, are familiar with the specific lifting equipment used in installation, and utilize proper personal lifting techniques. Follow lifting safe work practices and avoid unsafe work acts. Ensure employees get help to move heavier objects, and utilize move-smart techniques, as well as proper body motion-mechanics when performing physical lifting.

2. Warm up and stretch before lifting or pulling. Drink plenty of water throughout the day. Avoid excessive amounts of coffee, teas, colas, sodas, juices, etc. These

liquids will not re-hydrate an individual as well as water. Be prepared for inclement weather. Proper clothing (layered) for outside work activities is essential, and should include at a minimum: thermal underwear, arctic coverall gear, gloves, face mask, heavy socks, appropriately rated cold weather footwear (winter months). Get help with awkward loads. Ensure that employees are given sufficient time to conduct activities at the work site. Do not increase speed of activities. Ensure that employees are given multiple breaks throughout the workday.

3. Wear proper PPE to prevent personal injury. Anyone working at height will be trained in fall prevention/protection and will be wearing fall protection. Employees are to familiarize themselves with the immediate work area for any given task.

4. Ensure power tools and extension cords are good working order. Visually inspect the equipment before use.

5. Be alert to surroundings. Do not leave food sources out that can attract animals. Carry personal firearms and/or bear mace or be in the company of someone who has firearms and is trained in firearm use.

Note:
A change to a plan after the plan was developed is a major reason for health and safety incidents.

ANY CHANGE OF CONDITIONS THAT AFFECT THE PLAN WILL REQUIRE A SAFETY "TIME OUT" TO ASSESS HOW THAT CHANGE WILL IMPACT THE JOB AS PLANNED. WHEN ADDITIONAL HAZARDS ARE INTRODUCED INTO A PLANNED PHASE, CONTROLS WILL BE DISCUSSED WITH ALL PARTIES TO ENSURE SAFE EXECUTION DURING THE SAFETY "TIME OUT".

_____

5.1.4 Phase Hazard Analysis: Phase 4

Project: Pebble Project Meteorological Monitoring
Date: November 2004
Location: Iliamna, Alaska
Phase: Demobilization
Overall Risk Rank: Low
Phase Description: Demobilization consists of packing all tools, equipment and safety gear for transport back to Anchorage. The work area will be cleared of all debris and left in an orderly fashion.

Activities Include:

- Removal of all tools, and unused equipment and materials.
- Clean up and housekeeping at the job site and any other areas utilized as workspace or materials lay-down areas.
- Proper disposal of any waste materials generated during this installation.

	POTENTIAL HAZARDS	RISK
1.	Lifting Hazards	Low
2.	Muscle strains / overexertion / dehydration / fatigue / hypothermia	Medium
3.	Cuts and lacerations-striking against objects, pinch points and protruding objects	Low
4.	Electrocution while demobilizing system	Low
5.	Negative wildlife contacts	Low

1. Ensure crew members understand all project hazards, are familiar with the specific lifting equipment used in installation, and utilize proper personal lifting techniques. Follow lifting safe work practices and avoid unsafe work acts. Ensure employees get help to move heavier objects, and utilize move-smart techniques, as well as proper body motion-mechanics when performing physical lifting.

2. Warm up and stretch before lifting or pulling. Drink plenty of water throughout the day. Avoid excessive amounts of coffee, teas, colas, sodas, juices, etc. These liquids will not re-hydrate an individual as well as water. Be prepared for inclement weather. Proper clothing (layered) for outside work activities is essential, and should include at a minimum: thermal underwear, arctic coverall gear, gloves, face mask, heavy socks, appropriately rated cold weather footwear (winter months). Get help with awkward loads. Ensure that employees are given sufficient time to conduct activities at the work site. Do not increase speed of activities. Ensure that employees are given multiple breaks throughout the workday.

3. Wear proper PPE to prevent personal injury. Anyone working at height will be trained in fall prevention/protection and will be wearing fall protection. Employees are to familiarize themselves with the immediate work area for any given task.

4. Ensure power tools and extension cords are good working order. Visually inspect the equipment before use.

5. Be alert to surroundings. Do not leave food sources out that can attract animals. Carry personal firearms and/or bear mace or be in the company of someone who has firearms and is trained in firearm use.

Note:
A change to a plan after the plan was developed is a major reason for health and safety incidents.

ANY CHANGE OF CONDITIONS THAT AFFECT THE PLAN WILL REQUIRE A SAFETY “TIME OUT” TO ASSESS HOW THAT CHANGE WILL IMPACT THE JOB AS PLANNED. WHEN ADDITIONAL HAZARDS ARE INTRODUCED INTO A PLANNED PHASE, CONTROLS WILL BE DISCUSSED WITH ALL PARTIES TO ENSURE SAFE

EXECUTION DURING THE SAFETY “TIME OUT”.

Inspections/Audits:
The crew supervisor will review the upcoming work on a daily basis and review a Safety Analysis Form outlining safety procedures, safety equipment usage and the possible hazards associated with the work planned that day. The material will be presented to the crew as a “Tool Box Safety Meeting” prior to the start of work that day.

Possible Crew Members: Dominic Shallies, Jared Cockman, Brent Veltkamp, Eric Brudie, Steve Mackey

Emergency Action Plan:
Provide first aid. Immediately notify Pebble Partnership officials of the situation.

Additional Comments/Changes:

6.0 ADDITIONAL SAFETY CONSIDERATIONS

- Field crews must always work in pairs and carry a radio.
- No alcohol or illegal drug consumption is allowed.
- Those who carry epi-pens for allergic reactions are to advise NDM and other members of the field crew so that assistance can be provided if necessary.
- Be aware of the rules regarding the possession of firearms and/or bear mace when traveling to the project area. A weapon must be unloaded before boarding the helicopter and unloaded and securely stored while in camp. The name of the individual bringing a firearm into camp must be given to Richard Moses (NDM Site Manager or his designee) prior to arrival. Permission to carry bear mace must be obtained from the pilot before boarding the helicopter.
- Field crews need to understand the risk of extreme weather and the possibility of staying overnight in the field.

7.0 EMERGENCY CONTACTS & MEDICAL PROCEDURES

7.1 Pebble Partnership Emergency Contact Information

c/o Iliamna Weathered Inn #1 Roadhouse Strip or Box 124 Iliamna, AK 99606 Tel: (907) 571-1872 or 1774 Home: (907) 571-1872 Fax: (907) 571-1789 Email: lenabrommelard@hdgold.com	3201 C Street, Suite 604 Anchorage, AK 99503 Tel: (907) 339-2600 Toll Free: 1-877-450-2600 Fax: (907) 339-2601

7.2 Local Emergency Medical Services

Iliamna Clinic — Located on the Roadhouse Strip
Telephone: (907) 571-1383

Rene (Health Aid) — Home Telephone: (907) 571-1323

7.3 INTERFACE DOCUMENT

HCG has developed an Interface Document (Table 7-1) that outlines the interface HCG field and office personnel. Serious incidents must be reported immediately, while less serious ones shall be reported within the shift in which the incident occurred. This will include the completion of all necessary forms and documentation.

Interface Document
Table 7-1

Activity	Primary HCG Contact	Secondary HCG Contact
Environmental Non-compliance	Steve Mackey (563-2129)	Al Trbovich (563-2140)
Environmental Incident Reporting	Steve Mackey (563-2129)	Al Trbovich (563-2140)
Unauthorized/unaccompanied individuals on site	Steve Mackey (563-2129)	Al Trbovich (563-2140)
Compliance Audits: Scheduling, developing, conducting	Steve Mackey (563-2129)	Al Trbovich (563-2140)
Emergency Reporting	Steve Mackey (563-2129)	Al Trbovich (563-2140)
Agency Reporting	Steve Mackey (563-2129)	Al Trbovich (563-2140)
Field Installation Activities	Steve Mackey (563-2129)	Al Trbovich (563-2140)

7.4 MEDICAL EMERGENCY PROCEDURES

(1) Contact Pebble Partnership Base Camp in Iliamna by radio or telephone. Radio frequency being used is 151.625 MHz with a 123.000 MHz transmit and receive tone (private line).

(2) Contact Alaska State Troopers Dispatch: (907) 428-7200 (24 hrs/day).

In the event of a major emergency, the Alaska State Troopers will mobilize a response, including contacting the local State Trooper, medical, and rescue personnel.

Information to provide:

- Who you are
- Nature of emergency
- Your location
- Your company and contact number
- Number of victims
- Sex, age and vital signs of patients (if possible)
- Specific injuries

(3) Local emergency support in Iliamna and Newhalen:

- Iliamna State Trooper: (907) 571-1534
- Iliamna Clinic (Health Aid): (907) 571-1383
- Newhalen Clinic: (907) 571-1248
- Iliamna Air Taxi (has air Medivac capability): (907) 571-1245 / (907) 871-1445

_____

Check List

Tower:

- Check tower for stability, ensure that guy wires are taunt and all clamping hardware is in good condition.
- Check that all sensors are securely mounted to tower. This includes antennas and enclosures.
- Check for excessive ice build-up on tower and sensor mounts
- Check for loose instrument cables

Sensors:

Wind Direction:

- Check to see if wind vane is moving freely or fluttering in wind.
- Check for excessive ice or snow build-up on vane and sensor if so clear the sensor.
- After clearing ice or snow, check to see if vane can move freely in all directions.

Wind Speed:

- Check to see that cups are spinning freely.
- Check for excessive ice or build-up on vane and sensor, if so clear the sensor.
- After clearing ice or snow, check cups to insure they spin with ease.
- Clear ice or snow off of wind sensor cross arm.

All other sensors:

- Check sensor housing or brackets for visible damage.
- Check all sensor connection and cables to ensure good connections and secured to tower.
- Clear any ice or snow from sensor brackets and mounts.
- Check each sensor mount to ensure the sensor is level and secure.

Corrective Action Plan

The corrective action plan is designed to address the many unexpected problems that may arise during the project duration. HCG personnel are instructed to immediately bring any major problems to the attention of the project supervisor. Since many individuals could become involved in the corrective action, the notification is best done by a standard corrective action form.

This Corrective Action Form exists in three parts to address and correct program that occur during routine operation or as a result of performance evaluation and technical systems audits. The three parts are listed below:

- Request for Assistance
- Proposed Corrective Action
- Results of Proposed Corrective Action

It is recommended that all personnel signing the form should feel free to attach other needed material. These forms are stored at the HCG office both in electric and paper format.

Training/Education/Experience:

- How is program staff trained?_____
- Who is responsible for training staff?

Does the operator have training manuals or other training related materials available for staff?

Yes
No

3.0 General Program Information

3.1 Monitoring Site Description

Monitoring Site Name:

Monitoring Site Location Description:

Indicated by Operator	Determined by Auditor

3.2 Monitoring Site Appearance and Safety

Does the site appear clean, organized and well maintained?	Yes No	Comments:
Does the site appear to be safe and reasonably hazard free?	Yes No	Comments:
Does the site have a shelter for operators?	Yes No	Comments:
Does the site have emergency equipment such as a first aid kit available?	Yes No	Comments:
Does the site have adequate measures to prevent human tampering?	Yes No	Comments:
Does the site have adequate measures to prevent damage from animals?	Yes No	Comments:

3.3 Monitoring Site Surroundings

- Indicate the population density type for the monitoring site.

	Type	Description
	Remote	No nearby development with no nearby population center.
	Rural	Limited development with nearby sparse population.
	Low Suburban	Light industrial development in low population center.
	High Suburban	Light industrial development in high population center.
	Urban	Heavy industrial development in high population center.

3.4 Monitoring Site Equipment Inventory

- List all parameters that are being monitored and their associated instrumentation at the site.

Parameter	Make	Model	Serial No.

- List all instrumentation used in support of the monitoring instrumentation.

Instrument	Make	Model	Serial No.

3.5 Meteorological Instrumentation Siting and Exposure (EPA-454/R-99-005)

Do all sensors appear to be clean, intact, in good condition and well maintained?	Yes No	Comments:
Are all sensors operational, online and reporting data?	Yes No	Comments

3.5.1 Tower

Do all obstructions exist below a 1:10 slope away from the tower base?	Yes No	Comments
Is the height of the tower 10 meters above the ground?	Yes No	Comments:
Is the tower stable and plumb?	Yes No	Comments:
Is the tower protected from lightning?	Yes No	Comments:

3.5.2 Wind Speed and Wind Direction

Is the horizontal distance between the instrument and any obstruction at least 10 times the height of the obstruction?	Yes No	Comments:
Is the instrument 1.5 times the height of the building above the roof or 10 meters above the ground?	Yes No	Comments:
Are the wind speed and wind direction sensors stable and plumb?	Yes No	Comments:
Is the distance of the sensor on the cross arm/mast at least twice the diameter of the tower?	Yes No	Comments:
Is the wind sigma theta collected according to EPA requirements?	Yes No	Comments:

3.5.3 Air Temperature, Air Temperature Difference, and Relative Humidity

Are the sensors mounted over open level ground at least 9 meters in diameter and at least 2 meters above ground?	Yes No	Comments:
Are the two temperature difference probes located at a height of 2 meters and 10 meters above the ground?	Yes No	Comments
Is the ground beneath the temperature sensor natural native material?	Yes No	Comments
Is the site free of any man-made features exist that could create bias temperature data (e.g. asphalt, concrete, exhaust plumes, etc.)?	Yes No	Comments:
Is the site free of any natural made features that could create bias temperature data (e.g. open water, sloping ridge, etc.)?	Yes No	Comments:
Are the temperature sensors protected from the influence of solar radiation?	Yes No	Comments:
Are the sensors located at least four times the distance from the height of the obstruction?	Yes No	Comments:
Are the sensors located at least 30 meters from large paved areas?	Yes No	Comments:
Are the temperature sensors used for differential measurements located in identical aspirated shields?	Yes No	Comments:

3.5.4 Solar Radiation

Is the instrument situated above the plane of any obstructions that could cast shadows on the instrument?	Yes No	Comments:
Is the sensor situated to the south of the tower in order to minimize obstruction from the tower?	Yes No	Comments:

3.5.5 EPA Recommended Instrument Resolutions

Parameter	Equipment Specifications	EPA Resolution Standard	Meets Standard?

3.5.6 Recommended Instrument Accuracy Standards

Parameter	Equipment Specifications	EPA Accuracy Standard	Meets Standard?

3.5.7 EPA Recommended Instrument Response Standards

Parameter	Equipment Specifications	EPA Response Standard	Meets Standard?
Wind Speed			
Threshold:			
Distance Constant:

Time Constant:			
Operating Range:			
Spectral Response:			

3.6 Support Instrumentation and Equipment

Is the DAS well protected from the elements with adequate room for maintenance?	Yes No	Comments:
Is the DAS rated for operation in the expected local temperature range?	Yes No	Comments:
Are all sensor signal leads neatly and securely connected to the correct DAS channels?	Yes No	Comments:
Are all components of the DAS operational?	Yes No	Comments:
Is the communications equipment operating correctly?	Yes No	Comments:
Does the DAS system have a stable power supply?	Yes No	Comments:

Is the DAS properly grounded?	Yes No	Comments:
Is the DAS system protected from lightning?	Yes No	Comments:

4.0 Data Processing

4.1 Data Collection

Is the monitoring station polled on a regular basis?	Yes No	Comments:
Is the PM sample run date recorded?	N/A	Comments:
Is the PM sample start time and elapsed time recorded?	N/A	Comments:
Is the PM average flow rate recorded?	N/A	Comments:
Is each PM filter recovered after each run period?	N/A	Comments

- Indicate how the polled data are handled for data processing after being downloaded.

Are procedures in place for backing up raw data?	Yes No	Comments:

- How long are backup raw data files retained?
- How long are archived records retained?

Are hard copies of data being kept in case of computer failure?	Yes No	Comments:

4.2 Data and Sample Handling

Are written procedures for data handling available for the project?	Yes No	Comments:
Are filters properly secured once removed to prevent contamination or tampering?	N/A	Comments:

Are copies of the Site Check Forms being sent to the operator on a regular basis?	N/A	Comments:.
Are Chain-of-Custody forms being used to transmit materials, samples, and/or documents to and from the field?	N/A	Comments:
Are filters folded in half with collection surfaces in contact for transport to the lab?	N/A	Comments:
Are samples maintained in a secure location while awaiting shipment to the laboratory?	N/A	Comments:

- Diagram the data flow from monitoring equipment to submission of final report.

4.3 Data Validation

Are data validation procedures established and in use?	Yes No	Comments:

- Describe data validation procedure.

Are the individuals responsible for data collection separate from those responsible with data validation?	Yes No	Comments:

- Identify those responsible with data validation:

Name:
Position:
Affiliation:

- Identify how periods of missing or invalidated data are handled.

4.4 Data Reporting

Are quarterly and annual data reports being submitted for the site?	Yes No	Comments:
Is qualified staff prior to submittal of data reports making reviews of the report?	Yes No	Comments:

- Identify those person(s) responsible for review of data reports.

Name:
Position:
Affiliation:

4.5 Corrective Actions

Are procedures established for initiating corrective actions within the data processing steps?	Yes No	Comments:

- Describe procedures for tracking and closing corrective actions.

Data Capture (Section 4.5 EPA-454/R-99-005)

- Identify the desired data capture rate for the monitoring data.

Meteorological Monitoring Data Type	Capture Rate

Are the desired data capture rates being met for each data type?	Yes No	Comments:

5.0 Quality Assurance and Quality Control

5.1 Quality Assurance Program Plan

Has a quality assurance program plan (QAPP) been written that describes quality assurance procedures?	Yes No	Comments:
Is a copy of the plan available to field and data processing personnel?	Yes No	Comments:
Has the quality assurance plan been approved by the ADEC?	Yes No	Comments:

- Identify those person(s) responsible for updating the plan and the procedure for updating the plan.

Name:
Position:
Affiliation:

5.1.1 Quality Assurance Assessment Requirements (Section 8.0 EPA-454/R-99-005)

Have adequate audit procedures been identified within the quality assurance plan?	Yes No	Comments:
Does the plan adequately document the correct criteria for accuracy and precision?	Yes No	Comments:

- Indicate the project's correct precision and accuracy limits.

Parameter	***Precision Limit***	***Accuracy Limit***	***Reference***
DAS Time			
Wind Direction			
Wind Speed			
Air Temperature			
Air Temperature Difference			
Relative Humidity			
Solar Radiation			
Barometric Pressure			

5.2.1 Standard Operating Procedures

- Indicate the Standard Operating Procedures that have been developed for the program:

Standard Operating Procedures	
	Installation, Setup, and Checkout
	Site Operations and Calibrations
	Operational Checks and Preventive Maintenance
	Data Collection Protocols
	Data Validation Steps
	Data Archiving

5.2.2 Preventive Maintenance

Does a preventive maintenance program exist for the monitoring program and is the program being followed?	Yes No	Comments:

- Identify those responsible parties for preventive maintenance at the site.

Name:
Position:
Affiliation:

- Identify the preventative maintenance procedures conducted for the site.

5.2.3 Station Documentation

Is the Monitoring/QA plan comprehensive and reflective of the actual installation?	Yes No	Comments:
Does the station have an activity log?	Yes No	Comments:
Does the station have a Site Visit Log and Checklist Form?	Yes No	Comments:
Does the station have an adequate Calibration Report Forms and copies of previous calibrations?	Yes No	Comments:
Does the station have an adequate Operations Manual?	Yes No	Comments:

- Identify the operation manuals present on site.

Description

Are report forms and site logs properly completed and current?	Yes No	Comments:

6.0 Comments and Suggestions

Site Training Check list

This form should be included with the site visit memos. All training is site specific and is to be given by qualified HCG personal only.

Date of Training: _____

Station Name:_____ Project No._____

Name of Trainer: _____ Position: _____

Name of Trainee: _____ Position: _____

Nature of Training: _____

Is the trainee HCG personnel? If not specify associated company. Yes □ No □

Specify company name: _____ Position: _____

Site surveillances/maintenances visits:

- □ Has the specific monitoring project overview and objectives been discussed?
- □ Has site location and all safety concerns been discussed in detail?
- □ Has the scope of the site surveillances visit been discussed?
- □ Have all specific concerns pertaining to meteorological station been discussed.
- □ Has all site surveillance visit forms and filling procedures been discussed in detail?
- □ Have all site surveillances/maintenances visit task been clearly explained and demonstrate, including all equipment and senor operation, and safety practices pertaining to these tasks?
- □ Have all "as left" procedures been explained and demonstrated?

Audit and Calibration Visits:

- ☐ Has the specific monitoring project overview and objectives been discussed?
- ☐ Has the scope of the audit or calibration visit been discussed in detail?
- ☐ Have all specific concerns pertaining to meteorological station including any environmental safety concerns been discussed?
- ☐ Have all the audit or calibration forms, site visit documentation and filling procedures been discussed in detail?
- ☐ Have the functions and operations of each instrument located at the site been explained and demonstrated in detail?
- ☐ Have all audit or calibration task, tests, and recording techniques been clearly explained and demonstrated?
- ☐ Have all safety practices penetrating to the above task been clearly explained and demonstrated?
- ☐ Have all filling procedure and deadlines been discussed in detail?
- ☐ Have all "as left" procedures been explained and demonstrated?

Data Validation Checklist for Creating EPA Criteria Screening Data Bases:

The following criteria must be included in the spread sheet for each variable.

Parameter	Flagging Criteria[1]
Wind Speed (10 meters)	Value is < 0 m/s, > 25 m/s
	< 0.1 m/s variation for 3 consecutive hours
	<0.5 m/s variation for 12 consecutive hours
Wind Direction (10 meters)	Value is < 0°, > 360°
	<1° variation over 3 consecutive hours
	< 10° variation over 18 consecutive hours
Temperature (2 and 10 meters)	> 5°C variation from previous hour
	< 0.5°C variation for 12 consecutive hours
	Value is > record high, < record low
Temperature Difference, ΔT	Value is > 0.8°C during the daytime
	Value is < -0.8°C during the night
	Value is > 5°C, < -3°C
Relative Humidity (Dew Point Temperature)[2]	Value is > ambient temperature
	> 5°C variation from previous hour
	< 0.5°C variation for 12 consecutive hours
	Equals ambient temperature for 12 consecutive hours
Solar Radiation	> 0 W/m^2 at night
	Greater than the maximum possible value for date and latitude
Barometric Pressure	> 1060 mb (sea level)
	< 940 mb (sea level)
	> 6 mb variation for 3 consecutive hours
Precipitation	> 25 mm in one hour
	> 100 mm in 24 hours
	< 50 mm in one month

[1]Flagging criteria are based upon Table 8-4 Suggested Data Screening Criteria in *Meteorological Monitoring Guidance for Regulatory Modeling Applications* (EPA-454/R-99-005).

[2]Guidance document provides values in terms of dew point temperature.

APPENDIX C
STANDARD OPERATING PROCEDURES (SOPs) AND AUDIT/CALIBRATION FORMS

APPENDIX C1
STANDARD OPERATING PROCEDURES

Calibration Procedure for Climatronics F460 Wind Speed and Wind Direction Sensors

1.0 Introduction

Calibration of Climatronics F460 type wind speed and wind direction sensors (hereafter referred to as F460 sensors) are calibrated at the factory before receipt. Therefore, the calibration schedule for an F460 sensor requires an initial calibration check, and calibrations every 6 months. Calibrations are also required immediately after any repair, rewiring, adjustment, or replacement of the sensor or any sensor components.

The calibration is comprised of the determination of sensor responses to known input values, maintenance and adjustment of the sensors responses if warranted, and the documentation of all adjustments and responses.

Items required for the calibration of an F460 are as follows:

1. RM Young 18801 (or similar model) anemometer drive
2. Climatronics F460 linearity test fixture
3. PC or similar display module
4. Tripod mounted, survey grade compass and/ or pre-determined bearings to landmarks.
5. F460 manual

The calibration will begin by filling out the first part of the wind speed and wind direction calibration forms, noting the time, date, calibrator, and any witnesses.

1.1 System Inspection

Before determining the initial response of a F460 inspect the cable, cups, vane, and bearings for damage, open the outer cuff of the sensor and look for condensation inside. Note these observations on the Wind Speed Calibration Form.

2.0 Wind Speed Calibration Procedures

2.1 Pre-adjustment System checks

A system response check is performed by the use of an RM Young 18801 (or similar model) anemometer drive. The cups are removed from the sensor shaft and the anemometer drive is attached. The sensor is then challenged at the speeds specified on the Wind Speed Calibration Form. The speeds measured by the datalogger for each specific revolution per minute (rpm) are compared to the calculated values. The equation for calculating wind speed as a function of anemometer drive rpm is given on the Wind Speed Calibration Form.

2.2 Maintenance and Adjustments

At this point the technician should review the performance of the sensor and determine what adjustments are required, if any. All basic maintenance should be performed before any serious adjustment of the sensor, or determination of a new multiplier and/or offset in the datalogger programming. All maintenance and adjustments should follow the guidelines presented by the manufacturer in the F460 instrument manual.

2.3 Post-Adjustment Checks

If any maintenance or adjustments were performed, the steps listed in Section 2.1 of this procedure should be repeated and recorded on the Wind Speed Calibration Form. Results of the post adjustment checks should be closely evaluated. If the output values do not closely match the expected values, perform troubleshooting, maintenance, and adjustments as needed to correct the sensor response. If the sensor is deemed un-repairable by the technician, it should be replaced as soon as possible from the stock of back-up sensors for the monitoring project.

3.0 Wind Direction Calibration Procedures

3.1 Sensor Orientation

After the system is inspected, a check of the wind vane orientation is performed. The two methods for an orientation check of the wind vane are as follows:

<u>Compass</u>

1. Determine declination for the area using a Geomag type program with the most recent models of the earth's magnetic field.
2. Use a clamp fashioned from a band clamp and rubber tubing to fix the wind vane in various directions. In medium to high winds a vane with the "tail" removed may have to be used as to not damage the wind vane.
3. Using a tripod mounted and leveled, survey grade compass align the compass so that it sights directly at the tail of the wind vane.
4. Obtain readings in each of the four quadrants of the compass.
5. Record the readings from the datalogger and the compass on the Wind Direction calibration form.

<u>Landmark</u>

1. Obtain a GPS point directly under the wind direction sensor.
2. Using a mapping program (eg: TOPO!, allTOPO, or similar) with USGS datasets as its base files, obtain bearings to nearby defined landmarks.
3. Clamp and site the vane tail at the appropriate landmark and record the reading from the datalogger.

3.2 System Linearity Check

Using a Climatronics F460 linearity test fixture test the sensor at 30° intervals. Record the readings from the datalogger at each interval on the Wind Direction Calibration Form and compare to the expected values. If possible, check the linearity of the instrument by fitting a curve and checking the slope, and intercept of the Y = X line. Check to see if the accuracy of the instrument is no more than ± 5° (accuracy) and ≤ 3° mean absolute error (linearity). Mean absolute error is calculated by the the following equation: equation.

$$\sum \frac{|X|}{n}$$

Were *X* is the precision of the instrument at any given degree, and *n*, is the number of measurements taken.

3.3 Maintenance and Adjustment

At this point the technician should review the performance of the sensor and determine what adjustments are required, if any. All basic maintenance should be performed before any serious adjustment of the sensor, or determination of a new multiplier and/ or offset in the datalogger programming. All maintenance and adjustments should follow the guidelines presented by the manufacturer in the F460 instrument manual. If the orientation was incorrect, the alignment of the cross arm will need to be adjusted following the linearity check.

3.4 Post Adjustment Checks

After all maintenance and adjustments have been made, the steps listed in Sections 3.2 and 3.1 of this document should be repeated, respectively. All results should be recorded On the Wind Direction Calibration Form. Results of the post adjustment checks should be evaluated. If the output values do not closely match the expected values, perform troubleshooting, maintenance, and adjustments as needed to correct the sensor response. If the sensor is deemed un-repairable by the technician, it should be replaced as soon as possible from the stock of back-up sensors for the monitoring project.

4.0 Conclusion

At the conclusion of the calibration, complete all calibration forms noting any adjustments made, maintenance performed, and corrective actions taken, if any. Note the specific time which the calibrations for the wind speed and direction sensors began and ended. Sign and date the calibration form under any comments made.

Calibration Procedure for RM Young 05305-AQ Wind Speed and Wind Direction Sensors

2.0 Introduction

Calibration of RM Young 05305-AQ type wind speed and wind direction sensors (hereafter referred to as RM Young sensors) are calibrated at the factory before receipt. Therefore, the calibration schedule for an RM Young sensor requires an initial calibration check, and calibrations every 6 months. Calibrations are also required immediately after any repair, rewiring, adjustment, or replacement of the sensor or any sensor components.

The calibration is comprised of the determination of sensor responses to known input values, maintenance and adjustment of the sensors responses if warranted, and the documentation of all adjustments and responses.

Items required for the calibration of an RM Young are as follows:

1. RM Young 18801 (or similar model) anemometer drive
2. RM Young linearity test fixture
3. PC or similar display module
4. Tripod mounted, survey grade compass and/ or pre-determined bearings to landmarks.
5. F460 manual

The calibration will begin by filling out the first part of the wind speed and wind direction calibration forms, noting the time, date, calibrator, and any witnesses.

1.1 System Inspection

Before determining the initial response of a RM Young inspect the cable, prop, vane, and bearings for damage, open the outer cuff of the sensor and look for condensation inside. Note these observations on the Wind Speed Calibration Form.

2.0 Wind Speed Calibration Procedures

2.1 Pre-adjustment System checks

A system response check is performed by the use of an RM Young 18801 (or similar model) anemometer drive. The cups are removed from the sensor shaft and the anemometer drive is attached. The sensor is then challenged at the speeds specified on the Wind Speed Calibration Form. The speeds measured by the datalogger for each specific revolution per minute (rpm) are compared to the calculated values. The equation for calculating wind speed as a function of anemometer drive rpm is given on the Wind Speed Calibration Form.

2.2 Maintenance and Adjustments

At this point the technician should review the performance of the sensor and determine what adjustments are required, if any. All basic maintenance should be performed before any serious adjustment of the sensor, or determination of a new multiplier and/or offset in the datalogger programming. All maintenance and adjustments should follow the guidelines presented by the manufacturer in the RM Young instrument manual.

2.3 Post-Adjustment Checks

If any maintenance or adjustments were performed, the steps listed in Section 2.1 of this procedure should be repeated and recorded on the Wind Speed Calibration Form. Results of the post adjustment checks should be closely evaluated. If the output values do not closely match the expected values, perform troubleshooting, maintenance, and adjustments as needed to correct the sensor response. If the sensor is deemed un-repairable by the technician, it should be replaced as soon as possible from the stock of back-up sensors for the monitoring project.

3.0 Wind Direction Calibration Procedures

3.1 Sensor Orientation

After the system is inspected, a check of the wind vane orientation is performed. The two methods for an orientation check of the wind vane are as follows:

<u>Compass</u>

6. Determine declination for the area using a Geomag type program with the most recent models of the earth's magnetic field.
7. Use a clamp fashioned from a band clamp and rubber tubing to fix the wind vane in various directions.
8. Using a tripod mounted and leveled, survey grade compass align the compass so that it sights directly at the tail of the wind vane.
9. Obtain readings in each of the four quadrants of the compass.
10. Record the readings from the datalogger and the compass on the Wind Direction calibration form.

<u>Landmark</u>

4. Obtain a GPS point directly under the wind direction sensor.
5. Using a mapping program (eg: TOPO!, allTOPO, or similar) with USGS datasets as its base files, obtain bearings to nearby defined landmarks.
6. Clamp and site the vane tail at the appropriate landmark and record the reading from the datalogger.

3.2 System Linearity Check

Using a RM Young linearity test fixture test the sensor at 30° intervals. Record the readings from the datalogger at each interval on the Wind Direction Calibration Form and compare to the expected values. If possible, check the linearity of the instrument by fitting a curve and checking the slope, and intercept of the Y = X line. Check to see if the accuracy of the instrument is no more than ± 5° (accuracy) and ≤ 3° mean absolute error (linearity). Mean absolute error is calculated by the the following equation: equation.

$$\sum \frac{|X|}{n}$$

Were *X* is the precision of the instrument at any given degree, and *n*, is the number of measurements taken.

3.3 Maintenance and Adjustment

At this point the technician should review the performance of the sensor and determine what adjustments are required, if any. All basic maintenance should be performed before any serious adjustment of the sensor, or determination of a new multiplier and/ or offset in the datalogger programming. All maintenance and adjustments should follow the guidelines presented by the manufacturer in the RM Young instrument manual. If the orientation was incorrect, the alignment of the cross arm will need to be adjusted following the linearity check.

3.4 Post Adjustment Checks

After all maintenance and adjustments have been made, the steps listed in Sections 3.2 and 3.1 of this document should be repeated, respectively. All results should be recorded On the Wind Direction Calibration Form. Results of the post adjustment checks should be evaluated. If the output values do not closely match the expected values, perform troubleshooting, maintenance, and adjustments as needed to correct the sensor response. If the sensor is deemed un-repairable by the technician, it should be replaced as soon as possible from the stock of back-up sensors for the monitoring project.

4.0 Conclusion

At the conclusion of the calibration, complete all calibration forms noting any adjustments made, maintenance performed, and corrective actions taken, if any. Note the specific time which the calibrations for the wind speed and direction sensors began and ended. Sign and date the calibration form under any comments made.

Audit Procedure for Wind Speed and Wind Direction Sensors

1.0 Wind Speed

The required instruments to complete a wind speed audit are a torque watch, and anemometer drive.

The audit procedure is as follows: A system response check is performed by the use of an RM Young 18801 (or similar model) anemometer drive. The cups are removed from the sensor shaft and the anemometer drive is attached. The sensor is then challenged at the speeds specified on the Wind Speed Audit Form. The speeds measured by the datalogger for each specific rpm are compared to the calculated values. The equation for calculating wind speed as a function of anemometer drive rpm is given on the Wind Speed Audit Form. The absolute difference from expected values is then calculated to see if the values agree within ±0.5 mph or 5% of observed.

The starting torque should be measured with a torque watch, and recorded on the Wind Speed Audit Form. If the sensor starting torque is above 0.0049 oz-in the bearings may need to be cleaned, oiled, or replaced.

2.0 Wind Direction

The process for auditing a wind direction sensor is described below:

Compass

1. Determine declination for the area using a Geomag type program with the most recent models of the earth's magnetic field.
2. Use a clamp fashioned from a band clamp and rubber tubing to fix the wind vane in various directions. In medium to high winds a vane with the "tail" removed may have to be used as to not damage the wind vane.
3. Using a tripod mounted and leveled, survey grade compass align the compass so that it sights directly at the tail of the wind vane.
4. Obtain readings in each of the four quadrants of the compass.
5. Record the readings from the datalogger and the compass on the Wind Direction calibration form.

Landmark

7. Obtain a GPS point directly under the wind direction sensor.
8. Using a mapping program (eg: TOPO!, allTOPO, or similar) with USGS datasets as its base files, obtain bearings to nearby defined landmarks.
9. Clamp and site the vane tail at the appropriate landmark and record the reading from the datalogger.

2.1 System Linearity Check

Using a linearity test fixture appropriate for the sensor, test the sensor at 30° intervals. Record the readings from the datalogger at each interval on the Wind Direction Audit Form and compare to the expected values. If possible, check the linearity of the instrument by fitting a curve and checking the slope, and intercept of the Y = X line. Check to see if the accuracy of the instrument is no more than ± 5° (accuracy) and ≤ 3° mean absolute error (linearity). Mean absolute error is calculated by the equation 1.0.

$$\sum \frac{|X|}{n}$$

Were *X* is the precision of the instrument at any given degree, and *n*, is the number of measurements taken.

Calibration Procedure for MetOne 062 Temperature Sensors

1.0 Introduction

MetOne 062 temperature sensors (hereafter referred to as temperature sensors) are calibrated at the factory before receipt. Therefore, the calibration schedule for a temperature sensor requires an initial calibration check, and calibrations every six months. Calibrations are also required immediately after any repair, rewiring, adjustment, or replacement of the sensor or any sensor components.

Equipment required for temperature sensor calibration is as follows:

1. Calibrated, certified, NIST traceable thermometer.
2. Thermal mass unit and or ice, warm, and hot water bath.
3. PC or similar display module.
4. MetOne 062 manual

The calibration should start by completing the top of the Temperature Sensor Calibrations Form.

1.1 System Inspection

Before determining the initial response of the temperature measurement system, inspect the signal cable and sensor for signs of damage and wear. Note these observations in the Temperature Sensor Calibrations Form.

2.0 Pre-adjustment Calibration Procedures

2.1 System Response Check

The system response check is performed by comparing the sensor response with that of a calibrated NIST traceable thermometer for at least three different temperatures. The ideal temperatures to compare the sensors at are very cold, cold, warm , and hot. The very cold, cold, warm, and hot temperatures should be about -40˚C to -30˚C, 0˚C, 15 to 25˚C, and 30 to 40˚C, respectively. These temperatures can be obtained through the use of three small insulated thermoses and a Thermal Mass Device (TMD). The thermal mass device must be cooled by contact with dry ice (frozen CO_2). An ice bath should be used for the cold temperature range. For the warm and hot temperatures warm and hot water should be used. The thermometer and temperature sensor should be collocated as closely as possible by taping the sensors together. After allowing time for the temperature readings to stabilize, the technician will record the calibration and datalogger values on the Temperature Sensor Calibration Form. If possible, check the linearity of the instrument by fitting a curve and checking the slope, and intercept of the Y = X line. Check to see if the accuracy of the instrument is no more than ± 0.5° (accuracy) and no more than ± 0.1˚ for temperature difference between matched

sensors in a delta temperature measurement system. Mean absolute error is calculated by the equation 1.0. Were *X* is the precision of the instrument at any given degree, and *n*, is the number of measurements taken.

$$\sum \frac{|X|}{n}$$

3.0 Maintenance and Adjustments

After performing all system inspections and calibration checks, the results should be reviewed to determine what maintenance and adjustments are needed, if any. Maintenance procedures should follow the manufactures recommendations in the manual provided by the manufacturer. Since a true calibration of the sensor cannot be performed unless the sensor is checked across its full range, a sensor not conforming to the calibrated NIST thermometer will most likely need to be replaced and sent back to the factory for a true calibration.

4.0 Post-adjustment Checks

If maintenance or adjustments were made, the steps listed in Section 2.0 should be repeated and the results recorded in the Temperature Sensor Calibration Form. If the outputs do not agree within the specified limits troubleshooting, maintenance, and adjustments should be performed and noted.

5.0 Conclusion

When the instrument provides the proper response to the expected calibration values, complete the calibration form noting any adjustments, maintenance or repairs made. Sign and date the calibration form underneath any notes made in the comments section.

Audit Procedure for Temperature Sensors

The temperature sensors should be removed from the aspirators and checked at three temperature points. The system response check is performed by comparing the sensor response with that of a calibrated NIST traceable thermometer for at least three different temperatures.

The ideal temperatures to compare the sensors at are very cold, cold, warm , and hot. The very cold, cold, warm, and hot temperatures should be about -40˚C to -30˚C, 0˚C, 15 to 25˚C, and 30 to 40˚C, respectively. These temperatures can be obtained through the use of three small insulated thermoses and a Thermal Mass Device (TMD). An ice bath should be used for the cold temperature range. For the warm and hot temperatures warm and hot water should be used. The thermometer and temperature sensors should be collocated as closely as possible by taping the sensors together. Agitate each thermos to equilibrate the medium and remove any local temperature gradients, then record the audit sensor and datalogger values on the Temperature Sensor Audit Form.

The auditor should then compare all values recorded for the temperature sensors to the standards listed on the Temperature Sensor Audit Form. The standard for temperature sensors is ±0.5˚ of observed, and ±0.1˚ for temperature difference between matched sensors in a delta temperature measurement system.

Field Calibration Check for a Li-Cor LI200X Pyranometer

1.0 Introduction

LiCor LI200X pyranometers (hereafter referred to as pyranometers) are calibrated at the factory before receipt. Therefore, the calibration schedule for a pyranometer requires an initial calibration check, and calibrations every 6 months. Calibrations are also required immediately after any repair, rewiring, adjustment, or replacement of the sensor or any sensor components.

True calibration of a pyranometer is only accomplished in full mid-summer sun, on a perfectly clear day. This calibration should also last 2 full diurnal cycles. Since these conditions are rarely possible to meet in Alaska calibration field checks rather than true calibrations of pyranometers are performed.

A field calibration check is comprised of the comparison of the pre-adjustment responses to the responses obtained from a collocated, calibrated NIST traceable pyranometer, adjusting or performing needed maintenance on the pyranometer, and documentation of all collected data and adjustments made.

Equipment required for calibration is as follows:

1. Calibrated NIST traceable pyranometer.
2. Datalogger capable of the same scan and averaging frequency as the datalogger being used on-site.
3. All associated instrument manuals.

The calibration should be started by completing the top of the Solar Radiation Sensor Calibration Form.

1.1 System Inspection

Before determining the initial response of the solar radiation system, inspect the signal cable and pyranometer. Check the cable for signs of wear. Check that the pyranometer is level and free of dust. Record these findings in the Solar Radiation Sensor Calibration Form.

2.0 Pre-adjustment Systems Check

This check requires that the solar radiation sensor is in it's normal operating mode. The first part of the check consists of totally covering the sensor to exclude all light. Observe and record the output from the datalogger (which should be approximately zero) in the Solar Radiation Sensor Calibration Form. Next check the ambient light condition output for the sensor and calibration sensor. Record these values in the Solar Radiation Sensor Calibration Form.

Pre-adjustment Collocated Transfer Standard (CTS) Check

Set-up and level the CTS as near as practical to the site pyranometer. Record the concurrent values for the site and CTS pyranometer. Ideally, the CTS should be collecting data for the entire time the technician is on-site. These data should be collected at the same scan rate, and averaged at the same interval as the site pyranometer. Ideally a full diurnal cycle of concurrent readings from the site pyranometer and CTS should be taken.

In practice, the calibration technicians time on-site is limited due to the remoteness and access of monitoring sites in Alaska. Therefore, at least four averaging periods of the site and CTS should be used. That is, if the site datalogger is set to record hourly averages of solar radiation data, four hours of data should be taken form the site datalogger and the CTS. Record the solar radiation data, averaging interval, and all other pertinent information in the Solar Radiation Sensor Calibration Form. If possible check the linearity of the instrument by fitting a curve and checking the slope, intercept, and R^2 value of the Y = X line.

3.0 Maintenance and Adjustments

At this point in the field calibration check the technician should review the results of the system inspection, system check, and CTS check to determine if the sensor is operating within its acceptable limits, and establish what maintenance and adjustments are required, if any. Maintenance procedures should follow the manufactures recommendations in the manual provided by the manufacturer. Any maintenance and adjustments performed should be noted in the Solar Radiation Sensor Calibration Form.

4.0 Post-adjustment Checks

If any maintenance or adjustments were performed, the steps listed in Sections 3.0 and 4.0 of this procedure should be repeated and all data noted in the Solar Radiation Sensor Calibration Form. The results of the post-adjustment checks should be evaluated and noted. If the results do not agree within the specified limits troubleshooting, maintenance, and adjustments should be performed and noted. If the site pyranometer cannot be calibrated properly the unit may have to be replaced and sent back to the factory for repair.

5.0 Conclusion

Upon completion of the field calibration check, the Solar Radiation Sensor Calibration Form should be completed. Any adjustments, maintenance or repairs made should be noted. Sign and date the calibration form underneath any notes made in the comments section.

Solar Radiation Sensor Audit Procedure

Performance audits of a solar radiation system require a separate datalogger and a calibrated, NIST traceable pyranometer to serve as a collocated transfer standard (CTS). Procedure for the solar radiation system audit is as follows:

1. Set-up and level the CTS as near as practical to the site pyranometer.

2. Fill in the information of the top portion of the Solar Radiation Audit Form.

3. Record concurrent values for the site and CTS pyranometers for at least four of the site averaging intervals.

Ideally a full diurnal cycle of concurrent readings from the site pyranometer and CTS should be taken. However, In general practice the auditors time on-site is limited due to the remoteness and access of monitoring sites in Alaska. Therefore, at least four averaging periods of the site and CTS should be used. That is, if the site datalogger is set to record hourly averages of solar radiation data, four hours of data should be taken form the site datalogger and the CTS. Record the solar radiation data, averaging interval, scan rate, and all other pertinent information in the Solar Radiation Sensor Audit Form.

Calculated the percent difference according to the following equation and record the results in the Solar Radiation Sensor Audit Form.

$$\textit{Percent Difference} = \frac{\textit{(Observed value) - (Audit Value)}}{\textit{(Audit Value)}}$$

Check the linearity of the instrument, as compared to the CTS by fitting a curve and checking the slope, and intercept, of the Y = X line. To pass the audit the measures values should be within ±5% of observed (slope) and ±10 Wm^{-2} (intercept).

Calibration Procedure for Vaisala HMP- 45 Type Relative Humidity Sensors

1.0 Introduction

Vaisala HMP-45 type relative humidity sensors (hereafter referred to as relative humidity sensors) are calibrated at the factory before receipt. Therefore, the calibration schedule for a relative humidity sensor requires an initial calibration check, and calibrations every 6 months. Calibrations are also required immediately after any repair, rewiring, adjustment, or replacement of the sensor or any sensor components.

Equipment required for relative humidity sensor calibration is as follows:

1. Calibrated, certified, NIST traceable relative humidity sensor.
2. PC or similar display module.
3. Vaisala HMP-45 type sensor manual

The calibration should be started by completing the top of the Relative Humidity Sensor Calibrations Form.

1.1 System Inspection

Before determining the initial response of the relative humidity measurement system, inspect the signal cable and sensor for signs of damage and wear. Open the sensor cover to look for signs of water condensation on the circuit board. Note these observations in the Relative Humidity Sensor Calibrations Form.

2.0 Pre-Adjustment Sensor and System Check

The system and sensor check of a relative humidity sensor is performed by comparing the sensor response with that of a calibrated NIST traceable relative humidity sensor such as a Vaisala HMI-41, to serve as a collocated transfer standard (CTS). Collocate the CTS as near to the site remative humidity sensor as possible. For aspirated temperature measurements, the sensor should be collocated inside, or just outside the bottom of the aspirator to receive the same amount of airflow and solar shielding as the site relative humidity senor. Five concurrent, instantaneous readings should be recorded, at least minute apart. Record these values on the Relative Humidity Sensor Calibrations Form.

Next calculate the absolute percent difference for each values and record the results in the Relative Humidity Sensor Calibrations Form. These instantaneous values should agree with the values from the CTS within ±5%.

Calculate the dew point temperature for each of the five points taken. Dew point temperature or T_d should be calculated according to the following equation:

Note: this equation is only valid for the following conditions:

0 °C < T < 60 °C
0.01 < RH < 1.0
0 °C < T_d < 50 °C

Where:

T = temperature in degrees Celsius
RH = is the relative humidity as a fraction (not percent)
T_d = the dew point temperature to be calculated

The formula is:

$$T_d = \frac{b\,\gamma(T, RH)}{a - \gamma(T, RH)}$$

where

$$\gamma(T, RH) = \frac{a\,T}{b + T} + \ln RH$$

and

a = 17.27
b = 237.7 °C

The recommended system accuracy for dew point temperature is ±1.5°C of observed

3.0 Maintenance and Adjustments

After performing all system inspections and calibration checks the results should be reviewed to determine what maintenance and adjustments are needed, if any. Maintenance procedures should follow the manufactures recommendations in the manual provided by the manufacturer. Since a true field calibration of the sensor can rarely be performed any sensor not conforming to the calibrated NIST relative humidity sensor will most likely need to be replaced and sent back to the factory for a true calibration.

4.0 Post-adjustment Checks

If maintenance or adjustments were made, the steps listed in Section 2.0 of this document should be repeated and the results recorded in the Relative Humidity Sensor Calibrations Form. If the outputs do not agree within the specified limits troubleshooting, maintenance, and adjustments should be performed and noted.

5.0 Conclusion

When the instrument provides the proper response to the expected calibration values, complete the calibration form noting any adjustments, maintenance or repairs made. Sign and date the calibration form underneath any notes made in the comments section.

Relative Humidity Sensor Audit Procedure

Equipment needed for a relative humidity sensor audit includes a calibrated, NIST traceable, Vaisala HMI-41 or similar type relative humidity and temperature probe. This probe will serve as a collocated transfer standard (CTS).

The process for relative humidity as dew point audit procedure is as follows:

Collocate a calibrated NIST traceable relative humidity sensor such as a Vaisala HMI-41. Collocate the CTS as near to the site relative humidity sensor as possible. For aspirated temperature measurements, the sensor should be collocated inside, or just outside the bottom of the aspirator to receive the same amount of airflow and solar shielding as the site relative humidity sensor.

After the CTS has been given ample time to equilibrate five concurrent, instantaneous readings should be recorded, at least minute apart. Record these values on the Relative Humidity Sensor Audit Form.

Calculate the dew point temperature for each of the five points taken. Dew point temperature or T_d should be calculated according to the following equation:

Note: this equation is only valid for the following conditions:

0 °C < T < 60 °C
0.01 < RH < 1.0
0 °C < T_d < 50 °C

Where:

T = temperature in degrees Celsius
RH = is the relative humidity as a fraction (not percent)
T_d = the dew point temperature to be calculated

The formula is:

$$T_d = \frac{b\,\gamma(T, RH)}{a - \gamma(T, RH)}$$

where

$$\gamma(T, RH) = \frac{a\,T}{b + T} + \ln RH$$

and

a = 17.27
b = 237.7 °C

The recommended system accuracy for dew point temperature is ±1.5°C of observed.

Calibration Procedure for an ETI NOAH II Precipitation Gauge

1.0 Introduction

All ETI NOAH II precipitation gauges (hereafter referred to as precipitation gauges) are calibrated at the factory before receipt. Therefore, the calibration schedule for a precipitation gauge requires an initial calibration check, and calibrations every 6 months. Calibrations are also required immediately after any repair, rewiring, adjustment, or replacement of the sensor or any sensor components.

Equipment required for precipitation gauges calibration is as follows:

1. NovaLynx 260-2595 Tipping Bucket Rain Gauge Calibrator or large graduated cylinder.
2. PC or similar display module with P7GACOMM
3. ETI NOAH II manual

The calibration should be started by completing the top of the Precipitation Gauge Calibrations Form.

1.1 System Inspection

Before determining the initial response of the precipitation measurement system, inspect the signal cable and sensor for signs of damage and wear. Note these observations in the Precipitation Gauge Calibrations Form.

2.0 Pre-Adjustment Checks

2.1 System Check

To ensure that the weight measurement assembly (WMA) is functioning, slowly pour an initial amount of water into the gauge and check for a response from the datalogger.

2.2 Gauge Check

A calibration is performed by inputting known amounts of water into the gauge using a NovaLynx 260-2595 Tipping Bucket Rain Gauge Calibrator or large graduated cylinder and checking the system response. Water is usually inputted into the gauge 800mL at a time, across the full range (4-12” liquid in gauge).

Water should be delivered to the gauge slowly, and poured onto the side of the gauge to buffer the flow. This will ensure that the sensitive load cell in the WMA does not become damaged.

After each bottle of water is added to the gauge, the measurement system should be given ample time to read. This value should be noted in the Precipitation Gauge Calibrations Form. The values should agree within ±10% of the expected. If possible check the linearity of the instrument by fitting a curve and checking the slope and intercept of the Y = X line.

3.0 Maintenance and Adjustments

After performing all system inspections and calibration checks the results should be reviewed to determine what maintenance and adjustments are needed, if any. Maintenance procedures should follow the manufactures recommendations in the manual provided by the manufacturer. Due to limited time and marginal weather in the field a true field calibration of the sensor can rarely be performed. Therefore, any sensor not conforming to within ±10% of the expected values will most likely need to be replaced and sent back to the factory for a true calibration.

4.0 Post-adjustment Checks

If maintenance or adjustments were made, the steps listed in Section 2.0 should be repeated and the results recorded in the Precipitation Gauge Calibrations Form. If the outputs do not agree within the specified limits troubleshooting, maintenance, and adjustments should be performed and noted.

5.0 Conclusion

When the instrument provides the proper response to the expected calibration values, complete the calibration form noting any adjustments, maintenance or repairs made. Sign and date the calibration form underneath any notes made in the comments section.

Audit Procedure for an ETI NOAH II Precipitation Gauge

An audit of an ETI NOAH II precipitation gauge is performed by inputting known amount of water into the gauge using a NovaLynx 260-2595 Tipping Bucket Rain Gauge Calibrator or large graduated cylinder. Water is usually inputted into the gauge 800mL at a time, across the full range (4-12" liquid in gauge).

Water should be delivered to the gauge slowly, and poured onto the side of the gauge to buffer the flow. This will ensure that the sensitive load cell in the weight measurement assembly (WMA) does not become damaged. Ample time should be given for the gauge to calculate and read the delivered amount of liquid.

After each bottle of water is added to the gauge, the system measurement should be noted in the Precipitation Gauge Audit Form. The values should agree within ±10% of the expected. If possible check the linearity of the instrument by fitting a curve and checking the slope, intercept, and R^2 of the Y = X line.

Audit procedure is as follows:

1. Fill out the top of the Precipitation Gauge Audit Form noting the prevailing meteorological conditions.

2. Deliver water to the gauge in measured increments across the full range of the gauge, noting the volume delivered, expected and system response, and percent error.

3. Compare the error of the gauge to the limit of ±10%.

For the gauge to pass the audit each point taken must agree to the expected value within ±10%. The slope, intercept, and R^2 value for the Y = X line should also agree within ±10% of expected.

Calibration Procedure for a Nova Lynx 255-100 Evaporation Gauge

1.0 Introduction

All Nova Lynx 255-100 evaporation gauge (hereafter referred to as evaporation gauge gauges) are calibrated at the factory before receipt. Therefore, the calibration schedule for an evaporation gauge requires an initial calibration check, and calibrations every 6 months. Calibrations are also required immediately after any repair, rewiring, adjustment, or replacement of the sensor or any sensor components.

Equipment required for precipitation gauges calibration is as follows:

1. Large graduated cylinder or similar water delivery device
2. Ruler
3. PC or similar display module
4. Nova Lynx 255-100 manual

The calibration should be started by completing the top of the Evaporation Gauge Calibrations Form.

1.1 System Inspection

Before determining the initial response of the precipitation measurement system, inspect the signal cable and sensor for signs of damage and wear. Note these observations in the Evaporation Gauge Calibrations Form.

2.0 Pre-Adjustment Checks

2.1 System Check

To ensure that the float mechanism is functioning, slowly pour an initial amount of water into the gauge and check for a response from the datalogger.

2.2 Gauge Check

A calibration is performed by inputting known amounts of water into the gauge using a large graduated cylinder, measuring the height of the water in the evaporation pan, and checking the system response. Water is usually inputted into the gauge 800mL at a time, across the full range (3-9” liquid in gauge).

After each bottle of water is added to the gauge, the measurement system should be given ample time to read. This value should be noted in the Evaporation Gauge Calibrations Form. Check the linearity of the instrument by fitting a curve and checking

the slope and intercept of the Y = X line. These values should agree within ±10% of the expected.

3.0 Maintenance and Adjustments

After performing all system inspections and calibration checks the results should be reviewed to determine what maintenance and adjustments are needed, if any. Maintenance procedures should follow the manufactures recommendations in the manual provided by the manufacturer.

4.0 Post-adjustment Checks

If maintenance or adjustments were made, the steps listed in Section 2.0 should be repeated and the results recorded in the Evaporation Gauge Calibrations Form. If the outputs do not agree within the specified limits troubleshooting, maintenance, and adjustments should be performed and noted.

5.0 Conclusion

When the instrument provides the proper response to the expected calibration values, complete the calibration form noting any adjustments, maintenance or repairs made. Sign and date the calibration form underneath any notes made in the comments section.

Audit Procedure for a Nova Lynx 255-100 Evaporation Gauge

An audit of an Nova Lynx 255-100 evaporation gauge is performed by inputting known amount of water into the gauge using a large graduated cylinder or similar type of water delivery device. Water is usually inputted into the gauge 800mL at a time, across the full range (3-9" liquid in gauge).

Water should be delivered to the gauge slowly and ample time should be given for the gauge to read and calculate the delivered amount of liquid.

After each bottle of water is added to the gauge, the system measurement should be noted in the Evaporation Gauge Audit Form. Check the linearity of the instrument by fitting a curve and checking the slope and intercept of the Y = X line. These values should agree within ±10% of the expected.

Audit procedure is as follows:

4. Fill out the top of the Evaporation Gauge Audit Form noting the prevailing meteorological conditions.

5. Deliver water to the gauge in measured increments across the full range of the gauge, noting the level of water in gauge and system response.

6. Compare the linearity of the gauge to the limit of ±10%.

For the gauge to pass the audit the slope and intercept of the Y = X line should agree within ±10% of expected.

Systems Audit Procedures for the Pebble Project Meteorological Monitoring Program.

1.0 Introduction

A systems audit is an on-site inspection and review of the quality assurance system used for the total measurement system (sample collection, sample analysis, data processing, ect.) for each monitored parameter. Whereas, performance audits are quantitative appraisal, system audits are normally a qualitative appraisal. The standard operating procedures (SOP) in the projects analysis plan should be used as the basis for conducting a system audit. The purpose of a system audit is to determine whether or not the monitoring program has followed the SOP and quality control procedures and listed in the projects analysis plan. It also determines if the data generated are scientifically valid, defensible, and of specified accuracy and precision.

2.0 Audit Items

The following are typical items checked in a systems audit for a PSD Meteorological Monitoring Program:

1. Is the quality assurance organization operational

2. Are there written standard operation procedures (SOP) available for site operation and sampling, and are they being followed?

3. Are there written calibration procedures and schedules, including traceability documentation, and are they being followed?

4. Are there preventative maintenance procedures and are they being followed?

5. Are site logbooks, site checks forms, and other documentation being used and properly completed?

3.0 Audit Goals

The goal of a systems audit is to ass the overall operation of the quality assurance system. System audits generally entail the following procedures:

1. Preparing audit questionnaires for the monitoring site evaluations (F/ST9001.1) and for evaluation of the office activities related to the monitoring (F/ST9001.2).

2. Identifying deficiencies from previous audits and preparing a checklist covering these areas.

3. Arranging entrance interviews and briefing the site operator on the purpose and the scope of the systems audit.

4. Performing the systems audit.

5. Conducting exit interviews and debriefing on the system audit results

6. Preparing and submitting audit reports

7. Following up on report recommendations.

A systems audit will be conducted within 30 days of the commencement of the filed program in order to insure that all of the QA project plans specified procedures have been implemented. An early assessment is designed to prevent the accumulation of a large amount of questionable to invalid data bay quickly uncovering any discrepancies between the project plan and the actual monitoring effort. Thereafter, a systems audit will be conducted yearly.

Hoefler CONSULTING GROUP

☐ **Equipment Change**
☐ **Missing or Altered Data**

Activity
Repair/Replace

Lead Technician
Dominic Shallies

Summary

Restored communications to station datalogger.

Work Performed

Dominic Shallies and Eric Brudie visited the Williamsport station to reset the communications. The datalogger RS232 port was found to be locked up. This problem is suspected to have happened because of concurrent communications with the CC640 digital camera interface (MD485) over the CS I/O port and the Freewave radio over the RS232 port. All stored data and images were downloaded from the CR1000 and a new operating system (rev.15) was loaded. One of the bugs listed to be fixed in rev.15 is comm lock-up during concurrent comm. Settings and datalogger program were returned to original. Comm was tested to HCG and is good.

Pending Items

1. 3/16" cable clamp for propane tank guy wire.

APPENDIX D
STATEMENT OF QUALIFICATIONS

Air Quality Monitoring Services

Hoefler Consulting Group is an Anchorage-based consulting firm specializing in comprehensive environmental permitting and compliance services for Alaskan industries. Hoefler provides technical services supporting construction and operation of facilities in Alaska's unique physical, regulatory, and political environment. Hoefler is the leading air quality consulting firm in Alaska. The firm's staff of 40 professionals provides the following services from our Anchorage offices:

- PSD and non-PSD construction permitting
- Title V operating permitting
- Meteorological and ambient air quality monitoring programs
- Criteria pollutant, HAP, and greenhouse gas emission inventories
- Best available control technology demonstrations
- Air modeling compliance demonstrations
- Risk assessment
- Open burning approvals
- Certified opacity readings
- Source test supervision and support

Summaries of Experience for Key Personnel

ALAN M. TRBOVICH, CCM,

Vice President

Al Trbovich is a Certified Consulting Meteorologist and the Air Quality Team Leader of the Hoefler Consulting Group. He has 28 years of environmental permitting and regulatory compliance experience, and has been providing air quality services to his Alaskan clients throughout the state since 1998. Mr. Trbovich has extensive experience working with all facets of air permitting including construction ("PSD") and operating ("Title V") permitting, meteorological and ambient monitoring, compliance monitoring, source testing, and risk assessments. He is also a specialist in air quality modeling and has conducted ambient air quality and/or visibility modeling studies throughout Alaska. He has also lead numerous multi-disciplinary teams in preparing air permit applications, environmental impact statements, and other environmental studies. Mr. Trbovich holds B.S. and M.S. degrees in Meteorology from the University of Utah.

K. STEVEN MACKEY

Senior Project Manager

Steve Mackey is the Project Manger for the Air Quality Group at Hoefler Consulting group. He has over 22 years of air quality experience in air quality services project management as well as database development and management. His specialties include ambient air monitoring, meteorological monitoring, continuous emission monitoring systems (CEMS), source emissions measurement, and regulatory Compliance. Mr. Mackey holds B.S. degree in mechanical engineering from the University of Washington.

ERIC L. BRUDIE

Air Quality Consultant

Eric Brudie is an independent Air Quality Consultant that works with the Air Quality Group at Hoefler Consulting. He has over 24 years of air monitoring experience in air quality services. Mr. Brudie works with Hoefler Consulting as an independent contractor who specializes in conducting performance and systems audits of numerous PSD quality meteorological monitoring systems. His experiences include designee and operating numerous remote meteorological monitoring systems for the TAGS project, including the LNG terminal site 40-meter remote system. He functioned as a key team member in the preparation and agency approval of the Meteorological Monitoring & QA/QC Plan and the Application for Air Quality Control Permit to Operate with PSD Review for the proposed LNG liquefaction plant. Mr. Brudie holds a B.S. in Geological Engineering from the Colorado School of Mines.

W. DOMINIC SHALLIES

Associate Scientist

Dominic Shallies is an Associate Scientist at Hoefler Consulting. He assists in field project support and meteorological monitoring site operations for Air Quality Group. He has over 5 years experience in environmental monitoring and meteorological data collection. His specialties include PSD quality meteorological monitoring station installation and operation, data management, site assessment, and technical writing and editing. Mr. Shallies holds a BS in Environmental Science from the University of Alaska Southeast.

REBECCA K. VAN WYCK

Associate Scientist

Rebecca Van Wyck is the data Manager for the Air Quality Group at Hoefler Consulting. She has more than 5 years experience maintaining networks consisting of remote data collection stations. Her specialties include data management, statistical analysis, field data collection, and technical report writing and editing. Mrs. Van Wyck holds a B.S. in Environmental Science from Antioch College.

Executive Summary

On behalf of Northern Dynasty Mines Inc. (NDM), Hoefler Consulting Group (HCG) is collecting meteorological data to support baseline environmental studies, mine design objectives, and air quality permitting needs for the Pebble Project.

Prevention of Significant Deterioration- (PSD)-quality meteorological monitoring for the Pebble Project began on August 1, 2005 and will continue at least through July 31, 2007. This report provides details of the first full year of meteorological measurements collected from August 1, 2005 through July 31, 2006 at the proposed port location.

Table E-1 and E-2 provide monthly and annual valid data capture hours and the percent data capture, respectively, for the Pebble Port meteorological monitoring station.

Table E-3 provides items and procedures that differ from the Pebble Project Quality Assurance Project Plan (QAPP).

Table E-1. Meteorological Data Capture – Valid Hours per Month

[1]CLM = Climatronics wind speed and wind direction sensor.
[2]RMY = R.M. Young wind speed and wind direction sensor.
[3] Data capture value includes data corrected and flagged according to the recommendations in *Meteorological Monitoring Guidance for Regulatory Modeling Applications*, Section 8-6 and Table 8-3 (EPA-454/R-99-005).

Table E-3. Pebble Project QAPP Variation Table

Item/Procedure	Variation	Reason for Variation
An accuracy performance evaluation will be conducted within 30 days of site startup.	The performance evaluation was conducted within 35 days of site startup.	A faulty sensor delayed startup by 30 days. The delay had no effect on collected data as all sensors passed performance audits conducted during and after the monitoring year.

1.0 Introduction

1.1 Project Summary

On behalf of Northern Dynasty Mines Inc. (NDM), Hoefler Consulting Group (HCG) is collecting meteorological data to support baseline environmental studies, mine design objectives, and future air quality permitting needs for the Pebble Project. This meteorological monitoring program currently consists of three PSD-quality meteorological monitoring stations located at the proposed mill site (Pebble 1), the tailings storage facility (Pebble 4), and port site (Pebble Port). An additional, non-PSD meteorological monitoring station (Pebble 3) is located near the tailings storage facility and is collecting data for engineering and mine design purposes. Of the three PSD-quality meteorological monitoring stations, continuous measurements were made at the Pebble 1 and Pebble Port stations from August 1, 2005 through July 31, 2006, which concluded the first monitoring year of the meteorological monitoring program. Pebble 4 became operational on August 1, 2006, at the start of the second monitoring year.

Separate annual data reports have been prepared for both of the Pebble 1 and Pebble Port stations. This data report exclusively addresses the first year of measurements made at the Pebble Port station.

Figure 1-1 is a map of the Pebble Project meteorological monitoring sites in southwest Alaska. Figures 1-2 and 1-3 provide a higher resolution map and photograph, respectively, of the Pebble Port station.

The Pebble Port station collects data for the following meteorological parameters:

- Air temperature, two meters above ground level (degrees Celsius [°C])
- Air temperature, ten meters above ground level (degrees Celsius [°C])
- Temperature difference (ΔT, “Delta T” (degrees Celsius [°C]))
- Wind speed (meters per second [m/s])
- Wind direction (degrees [°])
- Wind direction standard deviation (wind sigma [σ_θ])
- Relative humidity (percent [%])
- Solar radiation (Watts per square meter [W/m^2])
- Barometric Pressure (millibar [mb]).

Measurements of these parameters will provide at least two years of representative surface observations for use in air dispersion modeling and for future air quality permitting.

1.2 Measurements Method Table

Table 1-1 lists each parameter measured at the Pebble Port station and includes the sensor manufacturer and model number, measurement range, accuracy, sampling frequency, and sample averaging period. All instruments meet or exceed the U.S. Environmental Protection Agency (EPA) PSD requirements for range accuracies, thresholds, response times, resolutions, damping ratios, and other measures of instrument performance. For this project, wind speed and wind direction measurements are collected using two different types of PSD-quality sensors collocated at 10-meters above ground level. The Climatronics F460 (CLM) features a three-cup anemometer and separate wind vane while the RM Young 05305-AQ (RMY) is a propeller-vane anemometer, which is a single unit consisting of a four-blade propeller fitted to the front end of a wind vane. Deploying two separate wind sensors at the Pebble Port PSD station serves primarily to prevent the loss of valid data in the event that one of the sensors is damaged or subjected to inclement weather conditions, such as icing. Because the manufacturers' stated wind speed accuracy, wind direction accuracy, and wind speed threshold values of the CLM sensor are better than those of the RMY sensor, the CLM sensor has been designated as the "primary" wind instrument for the Pebble Port station.

1.3 Variations from the Quality Assurance Project Plan

During the first monitoring year, there was one variation from the Pebble Project Meteorological Monitoring Quality Assurance Project Plan (QAPP).

The initial performance audit for the Pebble Port station was conducted on June 25, 2005 which is slightly more than thirty days prior to the monitoring period. At the time of this audit it was envisioned that monitoring period would start on July 1, 2005. However, due to a temperature sensor problem that was corrected on August 4, 2005, it was later decided to start the monitoring period on August 1, 2005 (rather than July 1, 2005). This later start to the monitoring year has no effect on collected data, as all performance audits (before, during, and after the monitoring year) passed. For a discussion of audits performed on the Pebble Port station, see Section 2.5.2 and Appendix C of this data report.

Table 1-1. Meteorological Measurement Methods

Parameter	Sensor Manufacturer/ Model Number	Measurement Method	Range	Accuracy	Sampling Frequency	Averaging Period
Ambient Temperature	Met One, Inc. Model 062 MP	Solid state thermistor	+50°C to -50°C	± 0.05°C	1 second	1 hour
Wind Speed[1]	Climatronics, Inc. F460 (P/N 100075)	Three-cup anemometer, LED photo chopper	0 to 65 m/s	± 0.15 m/s or 1%	1 second	1 hour
Wind Direction[1]	Climatronics, Inc. F460 (P/N 100076)	Light-weight vane, Low torque potentiometer	0 to 360°	± 2°	1 second	1 hour
Wind Speed[1]	RM Young Co. 05305-AQ	Propeller, magnetically induced AC sine wave	0 to 40 m/s	± 0.2 m/s or 1%	1 second	1 hour
Wind Direction[1]	RM Young Co. 05305-AQ	Light-weight vane, Low torque potentiometer	0 to 360°	± 3°	1 second	1 hour
Relative Humidity	Vaisala, Inc. HMP 45C	Capacitive polymer chip	0.8 to 100%	± 2%	1 second	1 hour
Solar Radiation	LI-COR, Inc. LI-200	Silicon photovoltaic detector	0 to 3,000 W/m^2 (400 to 1,100 nm)	± 5%	1 second	1 hour
Barometric Pressure	Vaisala, Inc. PTB 101B	Silicon capacitive sensor	600 to 1060 mb	± 0.5 mb	1 hour[2]	N/A[2]

[1]Wind speed and wind direction measurements are collected using two different types of PSD-quality sensors.

[2]Instantaneous barometric pressure measurements are collected for 1 second during every hour.

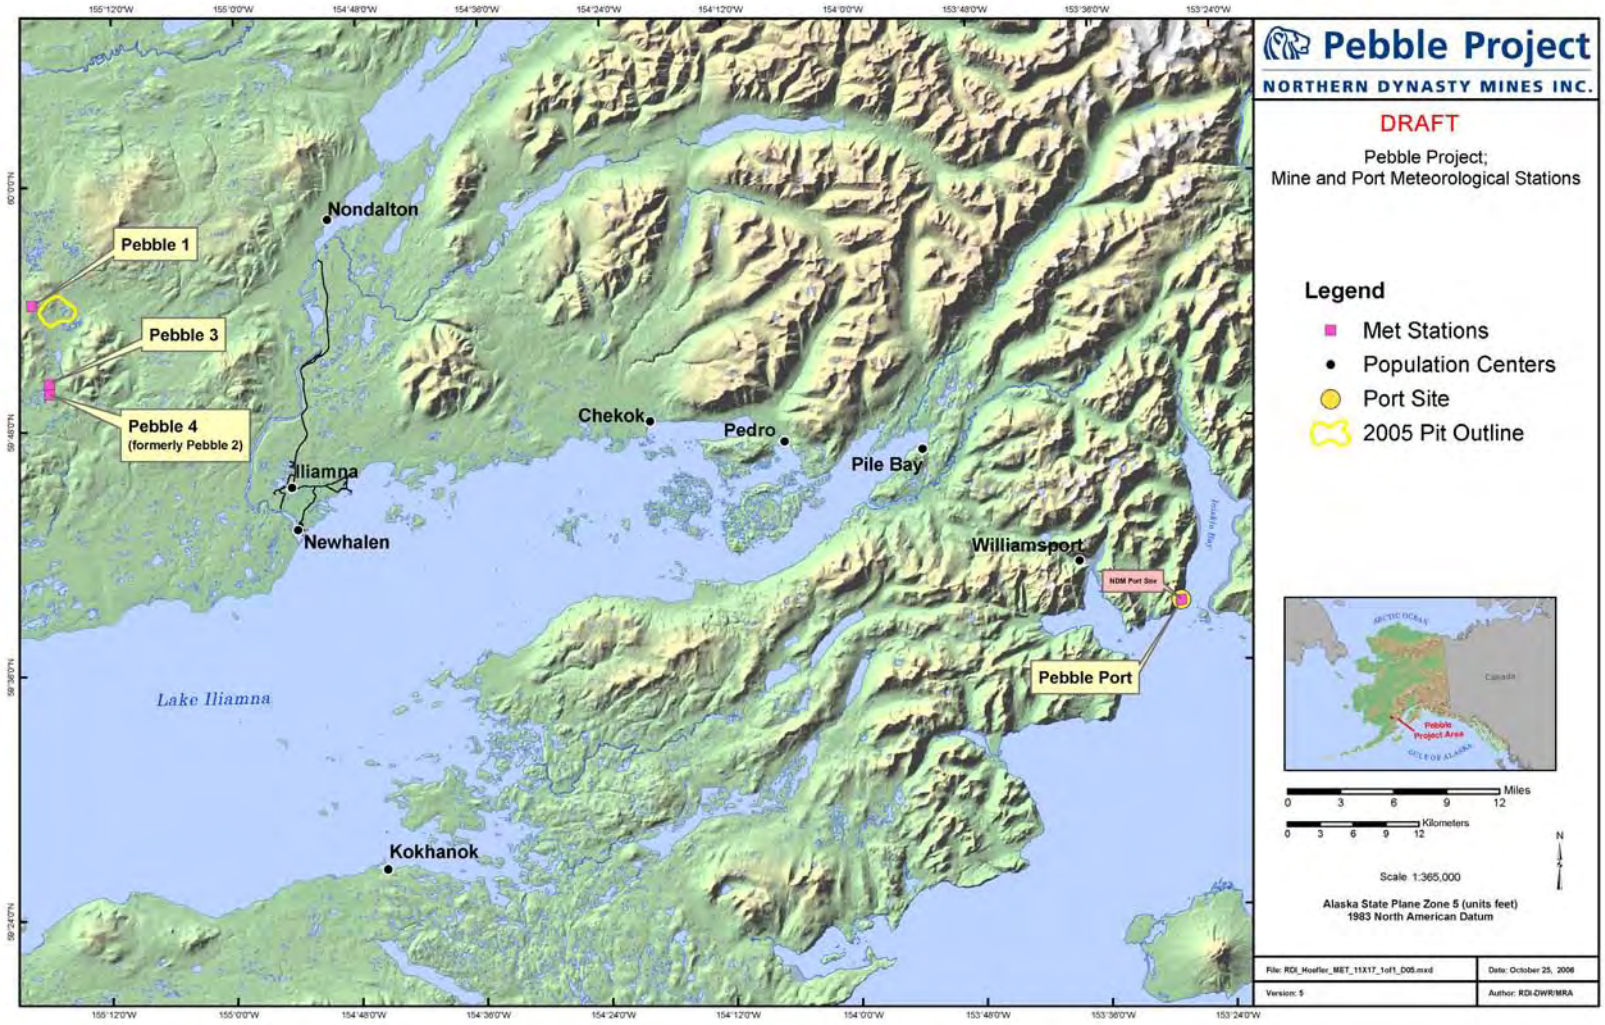

Figure 1-2. Map of the Pebble Port Station

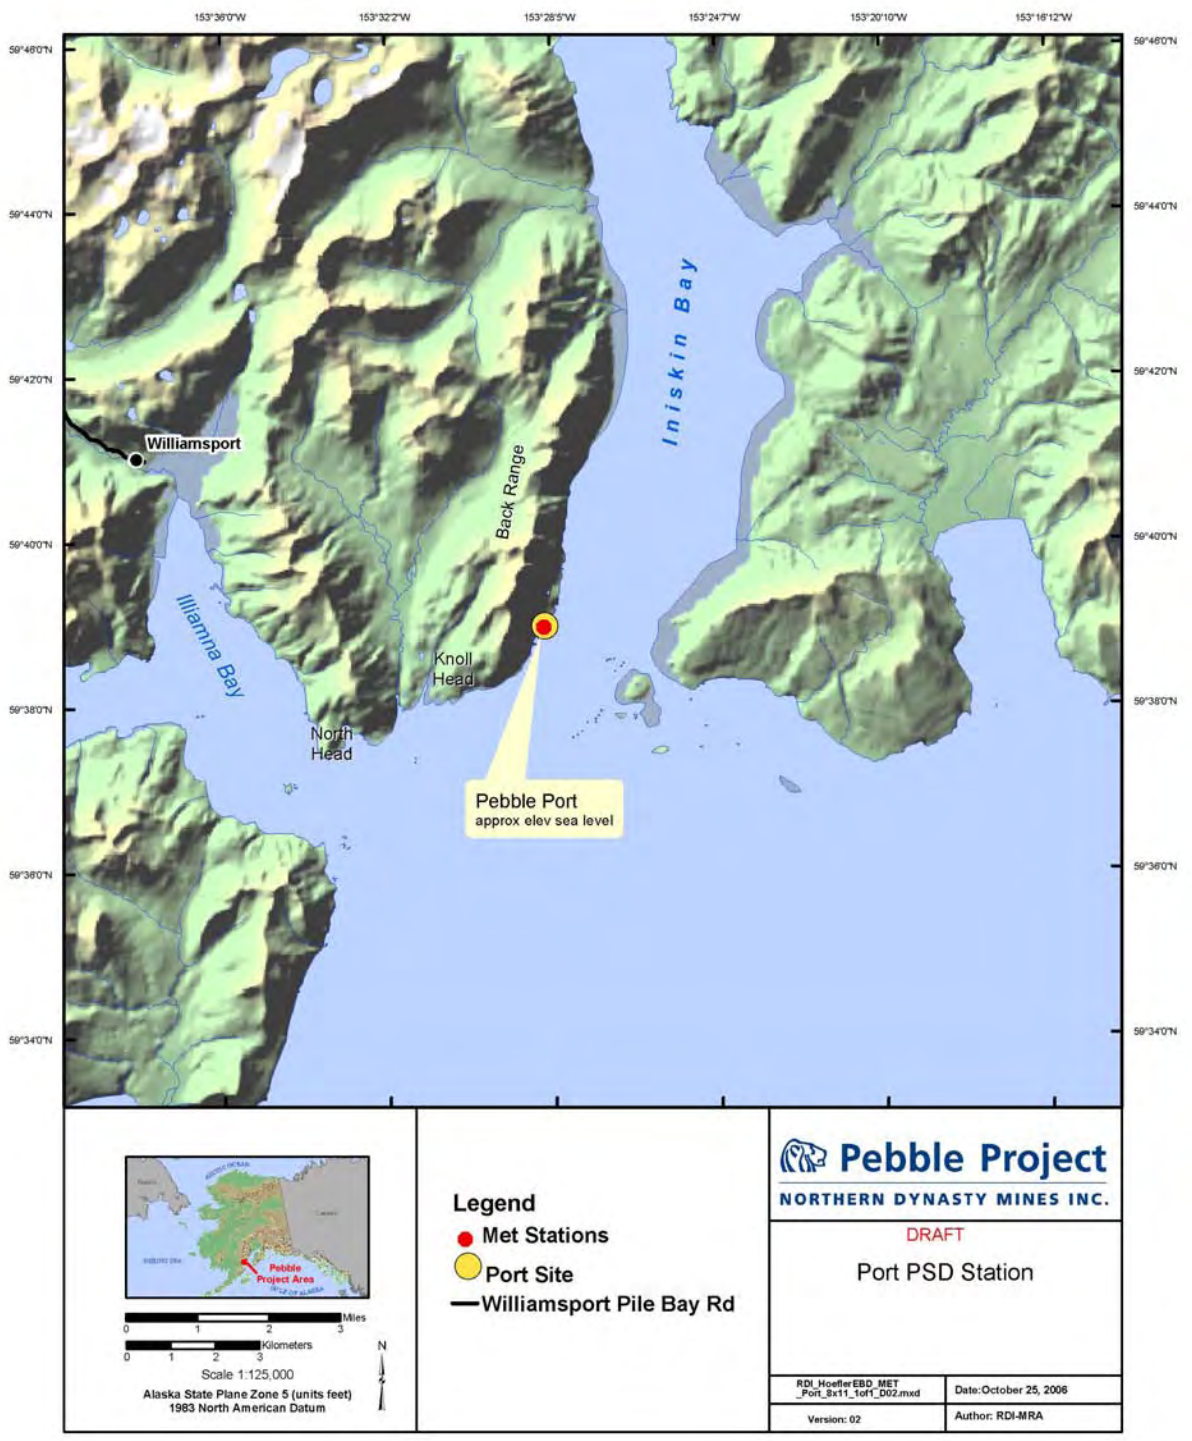

Figure 1-3. Pebble Port Meteorological Monitoring Station

2.0 Station Performance Summary

2.1 Significant Project Events

Table 2-1 summarizes the significant events that occurred at the Pebble Port station relevant to the first year of meteorological monitoring.

Table 2-1. Chronology of Events

Date	Event
June 21-25, 2005	Initial site installation and setup.
June 25, 2005	Initial systems performance audit and calibration.
July 19, 2005	Systems audit.
August 1, 2005	Start of the first meteorological monitoring year.
August 4, 2005	Maintenance and temporary rewiring of the 2-m and 10-m temperature sensors.
August 21, 2005	Permanent rewiring and calibration of the 2-m and 10-m temperature sensors.
September 24 - 25, 2005	Water damage to RH sensor. Maintenance and calibration successfully performed to repair sensor.
January 16, 2006	Semi-annual performance audit.
January 22, 2006	Storm up-ends station shelter and alters the alignment of the Climatronics wind direction sensor.
January 29, 2006	First visual confirmation that station shelter had been up-ended during storm on January 22, 2006.
February 8, 2006	Port shelter righted and visually inspected for damages.
February 10, 2006	Calibration and audit of wind sensors. Climatronics wind direction sensor was found to be out of alignment from the January 22, 2006 storm, was recalibrated, and passed a second audit.
July 31, 2006	Completion of the first meteorological monitoring year.
August 21, 2006	Second annual systems performance audit and calibration.

2.2 Missing, Invalid, and Adjusted Data

The data collected at the Pebble Port station were carefully reviewed during the quality assurance process. Some data were removed as a result of planned site activities, including data collected during station system and performance audits and calibrations. All data were validated only after being screened by the criteria listed in Table 8-4 of *Meteorological Monitoring Guidance for Regulatory Modeling Applications* (EPA-454/R-99-005). Table 2-2 lists the quantities of data that were flagged according to EPA criteria, yet not removed from the refined data set. All flagged data were carefully examined, but generally remained in the refined data set unless dictated by certain circumstances, including values outside the normal range of variation, consecutive repetitive values recorded for an unidentified reason, maintenance activity at the site, and impairing damage to sensors.

A thorough documentation of an error clearly defined may result in the correction of data, which will permanently be flagged (*Meteorological Monitoring Guidance for Regulatory Modeling Applications* (EPA-454/R-99-005)). A clearly defined error was identified in the Pebble Port data from January 22 to February 10, 2006, due to a storm altering the alignment of the Climatronics (CLM) wind direction sensor. Throughout this period, comparisons between the RM Young (RMY) and CLM wind direction data indicated a consistent difference of approximately 16 degrees. According to an audit of the wind sensors conducted on February 10, 2006, the accuracy and linearity of the CLM wind vane met EPA criteria, yet was out of alignment by a mean absolute error of +15.9 degrees. Because only the alignment of the CLM sensor had been affected and was consistently offset from the RMY instrument during the time span between the storm and audit, the CLM wind direction data throughout this period were corrected by subtracting the measured mean absolute error (+15.9 degrees). While these data have been retained in the refined Pebble Port database, the data have been permanently flagged as “corrected” as outlined in *Meteorological Monitoring Guidance for Regulatory Modeling Applications* (EPA-454/R-99-005).

Table 2-2. Percentage of Final Data Flagged

Parameter	Flagging Criteria[1]	Percent Flagged
Wind Speed (Climatronics)	Value is < 0 m/s, > 25 m/s	0.00%
	< 0.1 m/s variation for 3 consecutive hours	1.05%
	<0.5 m/s variation for 12 consecutive hours	0.00%
Wind Direction (Climatronics)	Value is < 0°, > 360°	0.00%
	<1° variation over 3 consecutive hours	1.34%
	< 10° variation over 18 consecutive hours	1.19%
Wind Speed (RM Young)	Value is < 0 m/s, > 25 m/s	0.00%
	< 0.1 m/s variation for 3 consecutive hours	0.96%
	<0.5 m/s variation for 12 consecutive hours	0.00%
Wind Direction (RM Young)	Value is < 0°, > 360°	0.00%
	<1° variation over 3 consecutive hours	1.36%
	< 10° variation over 18 consecutive hours	1.15%
Temperature (2 meters)	> 5°C variation from previous hour	0.03%
	< 0.5°C variation for 12 consecutive hours	0.83%
	Value is > record high, < record low	0.00%
Temperature (10 meters)	> 5°C variation from previous hour	0.03%
	< 0.5°C variation for 12 consecutive hours	0.95%
	Value is > record high, < record low	0.00%
Temperature Difference, ΔT	Value is > 0.8°C during the daytime	1.23%
	Value is < -0.8°C during the night	0.00%
	Value is > 5°C, < -3°C	0.00%
Relative Humidity (Dew Point Temperature)[2]	Value is > ambient temperature	0.00%
	> 5°C variation from previous hour	0.08%
	< 0.5°C variation for 12 consecutive hours	1.20%
	Equals ambient temperature for 12 consecutive hours	0.00%
Solar Radiation	> 0 W/m^2 at night	0.00%
	Greater than the maximum possible value for date and latitude	0.00%
Barometric Pressure	> 1060 mb (sea level)	0.00%
	< 940 mb (sea level)	0.00%
	> 6 mb variation for 3 consecutive hours	0.00%

[1]Based upon Table 8-4: Suggested Data Screening Criteria in *Meteorological Monitoring Guidance for Regulatory Modeling Applications* (EPA-454/R-99-005).
[2]Guidance document provides criteria relative to dew point temperature.

2.3 Network Data Completeness

Data completeness is a measure of the amount of data actually collected compared to the amount of data that could have been collected. Data completeness was calculated by dividing the number of valid hours of data by the total number of hours during the monitoring period. The data quality objective (DQO) for data completeness for the Pebble Project Meteorological Monitoring Program is 90 percent data capture per quarter for each parameter listed in Section 1.1. Table 2-3 provides a summary of data completeness, in terms of a percentage, for the first monitoring year at the Pebble Port station.

Table 2-3. Pebble Port Station Percent Data Capture

Period	Meteorological Parameters											
	2-m Temp	10-m Temp	Δ T	WS (CLM)[1]	WD (CLM)	Sigma (CLIM)	WS (RMY)[2]	WD (RMY)	Sigma (RMY)	RH	Solar	BP

2.5.2 Independent Quality Assurance Audits

A technical systems audit was performed at the Pebble Port station on June 25, 2005. The power supply, data acquisition system (DAS), communications system, and sensors all worked properly. The systems audit indicated that the station is well-planned, equipped with PSD-quality equipment, and properly sited according to criteria recommended by EPA. The operator provided adequate manuals for system maintenance and proper documentation to report operation and quality control activities. The operator was knowledgeable and competent with all meteorological equipment, communications equipment, and the power supply system. Appendix C contains the complete technical systems audit report.

An initial performance audit of the station was conducted on June 25, 2005. The performance audit involves reading the DAS output for each meteorological sensor and comparing the value with the input from an appropriate piece of audit equipment or from calibrated instruments collocated with the sensor. For each reading, the difference between the station value and the predicted value is compared with established PSD limits to assess the accuracy of the sensor. The results of the initial performance audit

are presented in Table 2-4. The complete performance audit report is available in Appendix C.

Table 2-4. Initial Performance Audit Summary (June 25, 2005)

Parameter	EPA Limit	Units	Maximum Absolute Error	Pass/Fail
Datalogger Time (AST)	≤ ±5:00	Min:Sec	00:02	Pass
Temperature Accuracy (2-m)	≤ ±0.5	°C	0.35	Pass

[3]NC = Not completed.

Subsequently, a performance audit was conducted on January 16, 2006 and a performance and systems audit was conducted on August 21, 2006. Each sensor was challenged with certified audit equipment and tested for compliance with PSD performance accuracy requirements. A summary of the results of these audits are

presented in Tables 2-5 and 2-6. The complete performance audit reports are available in Appendix C.

Table 2-5. Semi-Annual Performance Audit Summary (January 16, 2006)

Parameter	EPA Limit	Units	Maximum Absolute Error	Pass/Fail

3.0 Monitoring Data Network Summary

3.1 Air Quality Data Summary

Not applicable.

3.2 Meteorological Data Summary

3.2.1 Wind Speed (WS) and Wind Direction (WD) Climatology

Table 3-1 provides a statistical summary of Climatronics (CLM) and RM Young (RMY) wind speed measurements during the first year of meteorological monitoring at the Pebble Port station. The mean hourly average wind speed during the monitoring year was 4.89 m/s and 4.64 m/s for the CLM and RMY sensors, respectively. Maximum hourly average wind speeds of 20.42 m/s and 17.30 m/s were measured by the CLM and RMY sensors, respectively, at 7:00 PM on January 22, 2006.

Table 3-1 indicates that the RMY statistical values are generally 95% of the CLM values. A further analysis revealed the negative bias of the RMY sensor relative to the CLM sensor was found to be greatest during periods of turbulent winds. In particular, the agreement between the RMY and CLM measurements was best (>95%) when wind sigma values were less than 30 degrees and when winds were blowing from the northern end of Iniskin Bay. This observation is in agreement with studies that have found propeller-vane instruments have an inherent negative bias in turbulent winds due to the propeller-vane lagging behind the instantaneous wind direction. (e.g., Kristensen, 1994; Kristensen et al., 2001). While the cup anemometer appears to be less susceptible to under-reporting of wind speeds in turbulent winds, the vane-propeller anemometer was found to be a high-precision PSD-quality instrument less susceptible to icing than the cup anemometer. Therefore, the deployment of both sensor types has been advantageous for meteorological monitoring under an array of inclement weather conditions encountered at the Pebble Project site.

Table 3-1. Average and Maximum Wind Speeds

Monitoring Period	Mean Hourly Average Wind Speed (m/s) (CLM)	Mean Hourly Average Wind Speed (m/s) (RMY)	Maximum Hourly Average Wind Speed (m/s) (CLM)	Maximum Hourly Average Wind Speeds (m/s) (RMY)
Quarter A	4.53	4.27	17.66	16.80
Quarter B	5.90	5.61	20.42	17.30
Quarter C	5.47	5.24	16.34	15.77
Quarter D	3.69	3.48	16.01	15.15
Monitoring Year	4.89	4.64	20.42	17.30

Figure 3-1 shows first year wind roses for the CLM and RMY wind instruments collocated at the Pebble Port station. During the monitoring year, winds were predominantly from the north-northeast and north with infrequent winds from southerly directions. Figures 3-2 and 3-3 present the quarterly wind roses for the CLM and RMY sensors, respectively. All of the quarterly wind roses are characterized by predominant wind components from the north-northeast and north. In addition, the Quarters A and D wind roses display substantial wind components from the south-southwest and northwest. The Quarter B (November 1, 2005 through January 31, 2006) wind rose has dominant wind components from the north-northeast, north, and northwest. However, in contrast to Quarters A and D, the Quarter B wind rose indicates a lack of southerly winds during Quarter B. Similarly, the predominant wind components in the Quarter C (February 1, 2006 through April 30, 2006) wind rose are from northerly directions with only minor south-southwest and northwest wind components.

Tables 3-2 through 3-6 are the annual and quarterly wind analysis tables for the CLM wind measurements. Tables 3-7 through 3-11 are the annual and quarterly wind analysis tables for the RMY wind measurements.

Figure 3-4 shows the first year wind rose for the Climatronics wind sensor superimposed over a map of the Pebble Port site and vicinity. The wind rose is centered over the Pebble Port station and shows that, on an annual basis, winds at the site predominantly blow parallel to the shoreline and toward the mouth of Iniskin Bay.

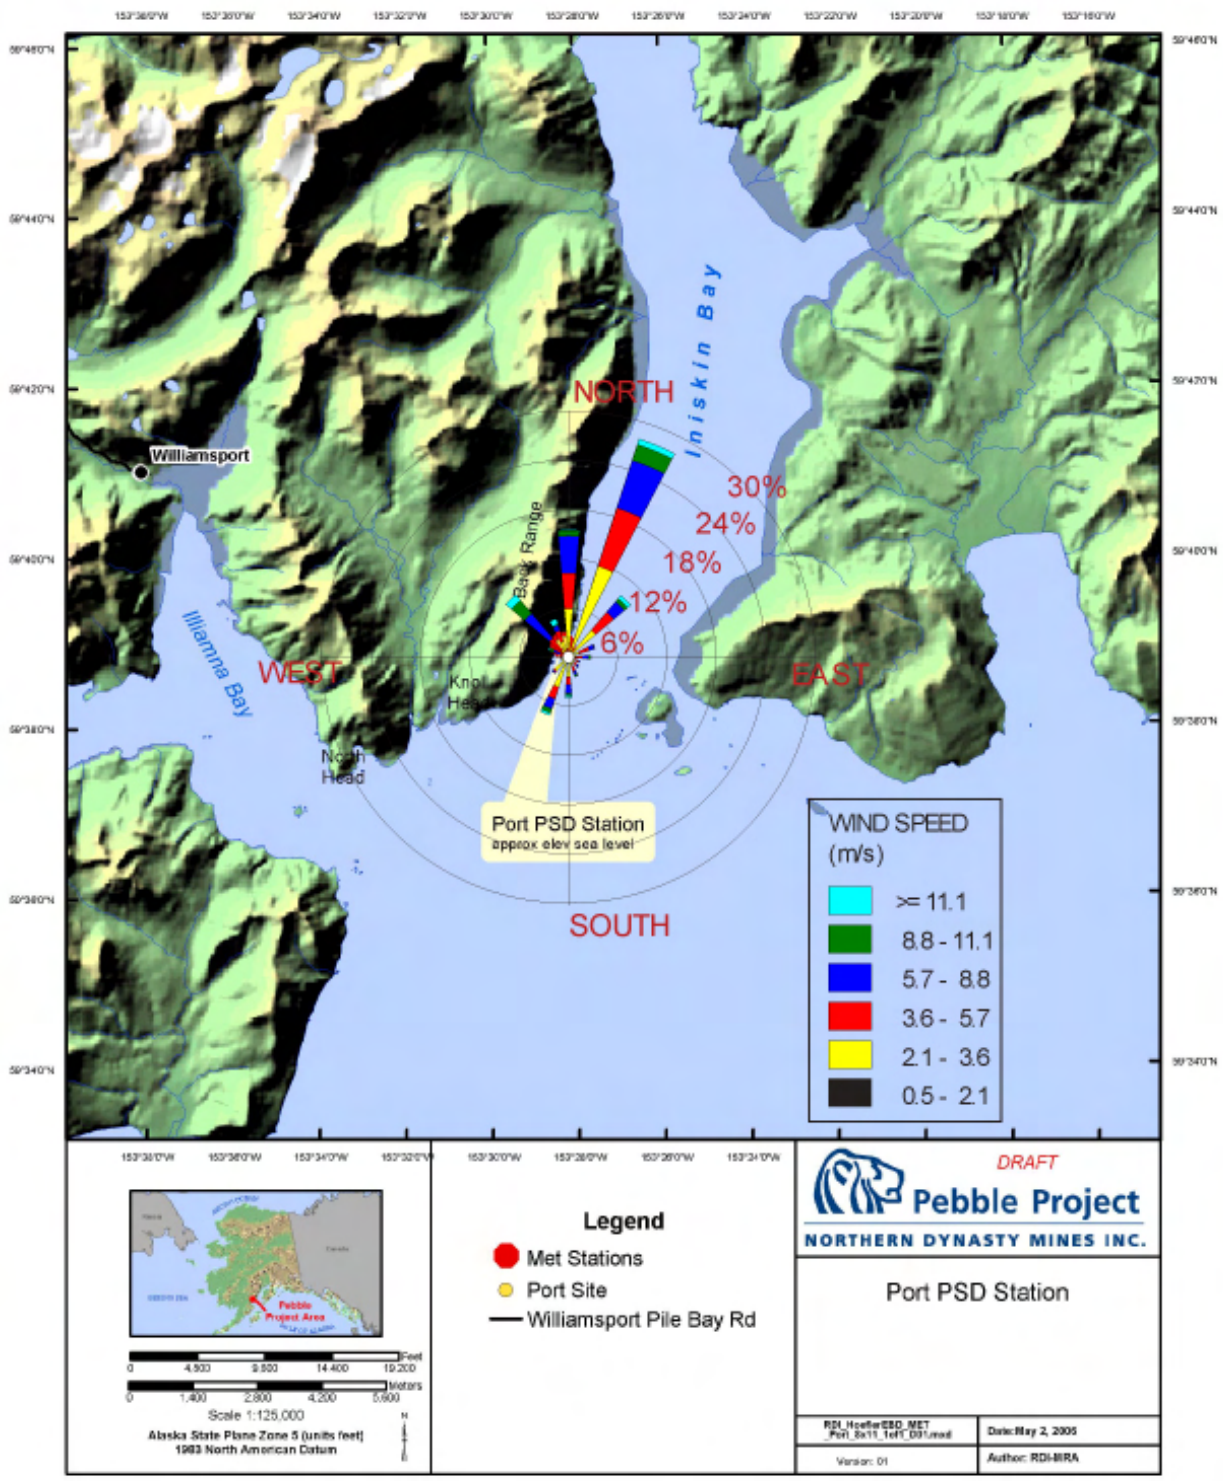
Figure 3-4. Annual[1] Wind Rose Superimposed on Site Map



[1] First monitoring year: August 1, 2005 to July 31, 2006.

3.2.2 Temperature Climatology

Tables 3-12 and 3-13 give the maximum and minimum daily mean temperatures, monthly mean temperatures, and maximum and minimum hourly average temperatures for the 2-meter and 10-meter temperature measurements, respectively. The annual (August 1, 2005 through July 31, 2006) mean temperature was 3.7°C at the 2-meter height. This annual mean temperature is slightly higher in comparison to the annual mean temperature of 1.6°C observed at the Iliamna airport based upon data collected from 1971 to 2000 (Alaska Climate Research Center). Daily average temperatures at the Pebble Port station varied from a maximum of 17.4°C on August 5, 2005 to a minimum of -22.3°C on January 27, 2006.

Figure 3-5 provides a graph of the 2-meter and 10-meter hourly average temperatures. Considerable temperature variations occurred throughout the late-autumn and winter months.

Figure 3-6 shows a plot of the vertical temperature difference (the difference between 10-m and 2-m temperature values) during the monitoring year. The greatest positive vertical temperature difference was 3.8°C measured on May 27, 2006. The greatest negative temperature difference was -2.7°C measured on January 28, 2006.

Figure 3-5. Hourly Average 2-Meter and 10-Meter Temperatures

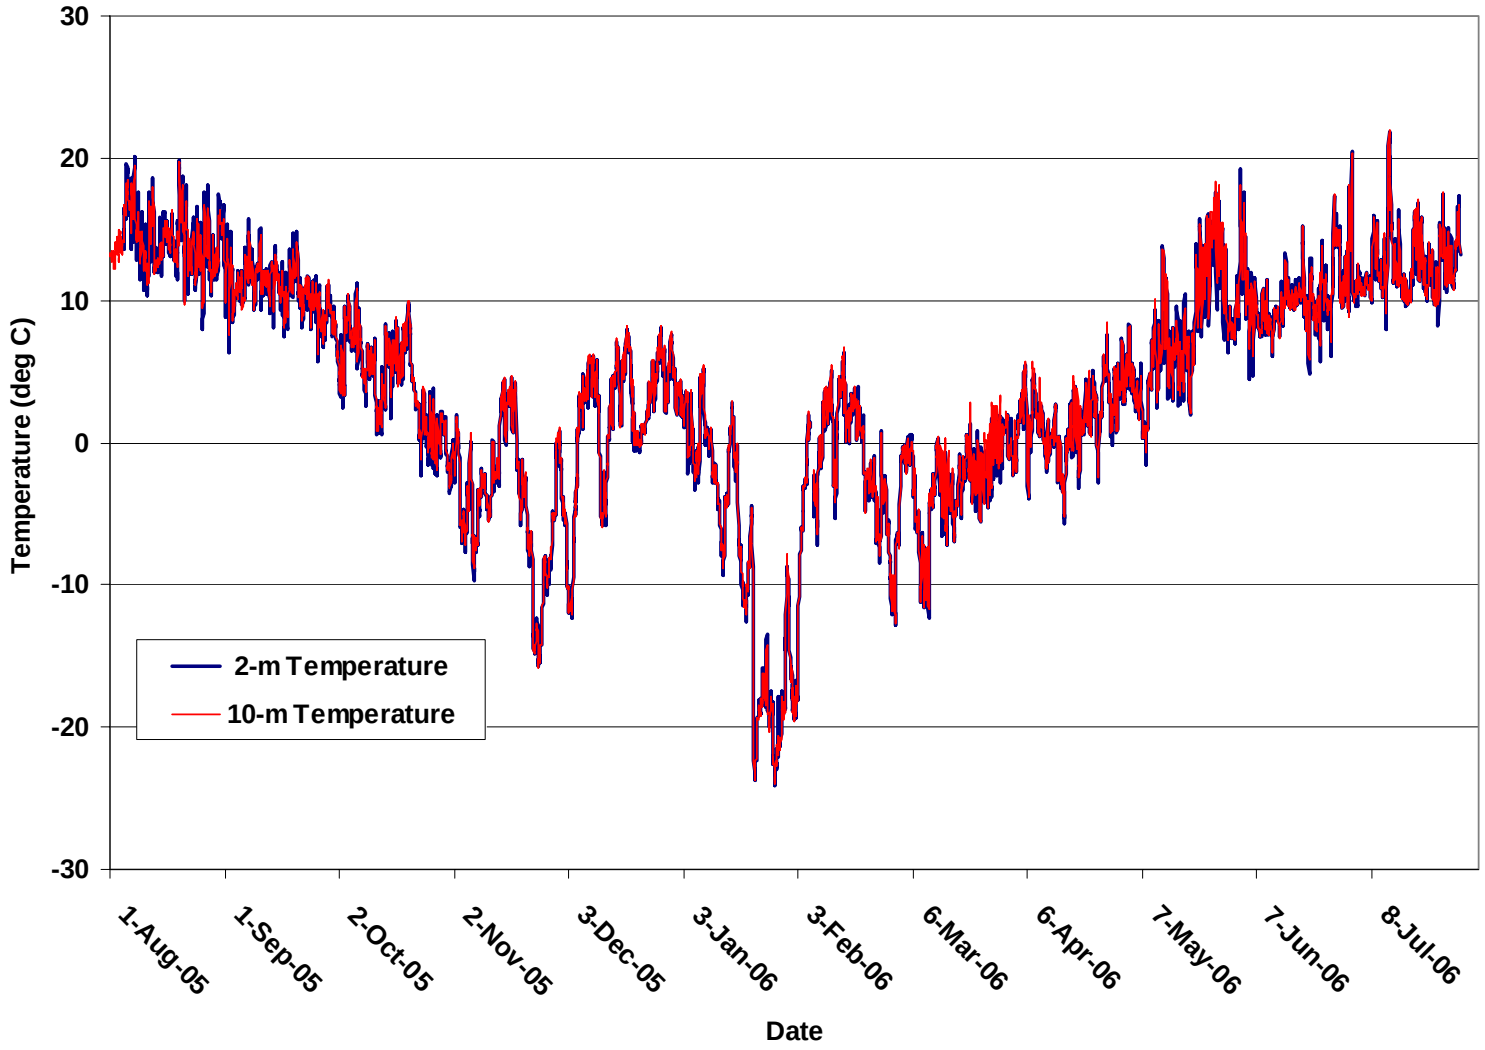

Figure 3-6. Hourly Average Vertical Temperature Difference

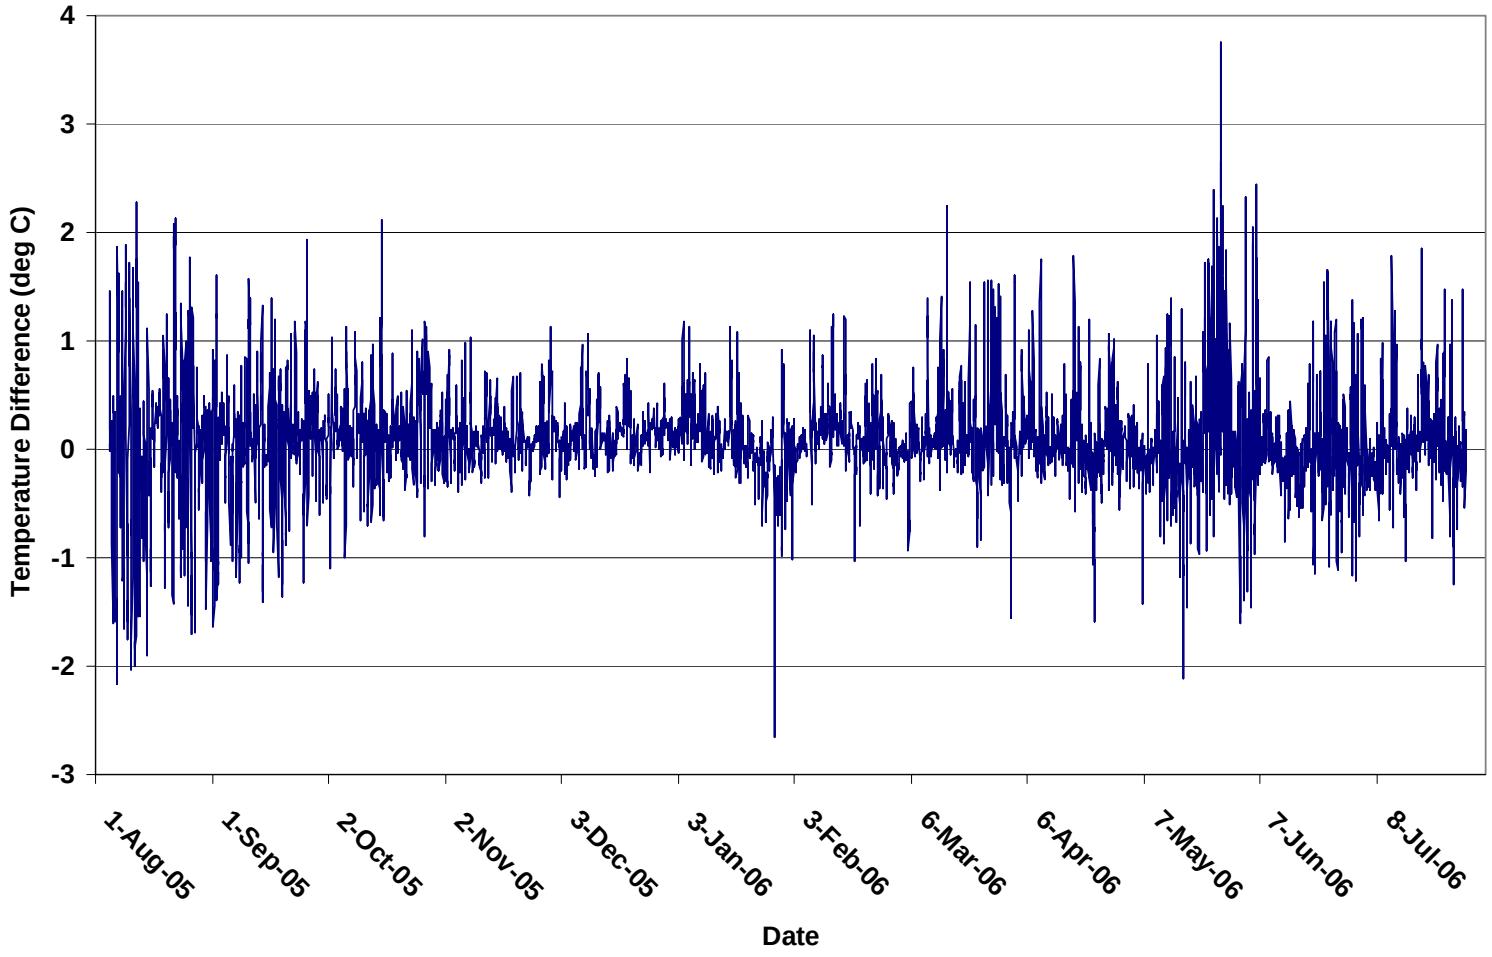

3.3.3 Other Meteorological Parameters

Other meteorological parameters measured at the Pebble Port station include relative humidity, barometric pressure, and solar radiation.

Figure 3-7 is a plot of the annual hourly average relative humidity. Relative humidity at the Pebble Port site varied from a low of 24 percent to a high of 100 percent. The mean relative humidity during the monitoring year was 74 percent.

Figure 3-8 is a plot of the annual hourly instantaneous barometric pressure measurements. Barometric pressure varied from a minimum of 963 mbar on February 6, 2006 to a maximum of 1,040 mbar observed ten days later on February 16, 2006. The mean barometric pressure during the monitoring year was 1,005 mbar.

Figure 3-9 is a plot of the annual hourly average solar radiation. The maximum hourly average solar radiation was 818 W/m^2 recorded on June 4, 2006 at 2:00 p.m. The mean hourly average solar radiation for the monitoring year was 89 W/m^2.

Relative humidity, barometric pressure, and solar radiation data are available in monthly tabular format in Appendix D.

Appendix A

Data Processing and Statistical Formulae

A.1 Data Recovery Percentage

Data completeness for meteorological monitoring methods was calculated assuming a minimum of 90 percent valid hourly average data to calculate quarterly average data completeness and a minimum of 90 percent quarterly data completeness for four consecutive quarters.

Quarterly data completeness (DC_i) was determined using the following equation:

$$DC_i = h_v/h_i \times 100$$

Where: h_v = number of hours of valid data actually collected

h_i = number of possible valid hours of data collection during the monitoring period

1.0 INTRODUCTION

Hoefler Consulting Group, Inc. (HCG) operates meteorological monitoring stations for Northern Dynasty Mines, Inc. (NDM) in support of the Pebble Mine Project near Iliamna, Alaska. The air monitoring program is one component of ongoing baseline environmental studies being conducted to support mine permitting, mine design and mine transportation infrastructure development. The stations meet Prevention of Significant Deterioration (PSD) guidelines, although PSD permits may not be required. This report covers the Port monitoring station located near the proposed mine port site.

The Pebble Port Station is located on the west shore of Iniskin Bay, near the southern end of the bay. The station is situated on a 50' high knoll, very near the water's edge. The Port Station consists of an instrumented 11-meter sectional tower secured with three guy wires. Approximately 20' south of the tower is a 6' by 8' insulated building which houses the datalogger and power supply system. The Pebble Port Station is instrumented with PSD quality sensors monitoring the following parameters:

- Ambient Temperature (ºC): Met One 062MP Thermistor Probe at 2-m
- Temperature Difference (ºC): Met One 062MP Thermistors at 2-m and 10-m
- Wind Speed 1 (m/s): Climatronics F460 P/N 100075 Wind Speed Sensor
- Wind Direction 1 (°): Climatronics F460 P/N 100076 Wind Direction Sensor
- Wind Speed 2 (m/s): RM Young 05305 Wind Monitor-AQ
- Wind Direction 2 (°): RM Young 05305 Wind Monitor-AQ
- Sigma Theta (°): Campbell Scientific CR10X DAS calculated (Yamartino)
- Relative Humidity (%RH): Vaisala HMP45AC Relative Humidity Sensor
- Barometric Pressure (mbar): Vaisala PT101B Barometric Pressure Sensor
- Solar Radiation (W/m2): LI-COR Li-200SX Solar Radiation Pyranometer.

This report has been prepared for NDM to serve as an official review of the Pebble Port Station and a review of the overall Pebble Project Meteorological Monitoring Program. To that end, Systems and Performance Audits were undertaken in order to help demonstrate that the equipment and procedures used for collecting meteorological data by HCG meet the requirements set forth by the U.S. Environmental Protection Agency (EPA) and the Alaska Department of Environmental Conservation (ADEC).

2.0 SYSTEMS AUDIT

2.1 Systems Audit Methodology

In the *Quality Assurance Handbook for Air Pollution Measurement Systems* and the *Meteorological Monitoring Guidance for Regulatory Modeling Applications*, EPA provides guidance for conducting systems audits. EPA recommends that a systems audit be conducted to serve as a qualitative review of all aspects of a meteorological monitoring program. The systems audit includes a review of the program plan, station site, facilities, equipment, personnel, procedures, record keeping, data validation and data reporting. The systems audit should be completed within the first 30 days of operation and every year thereafter.

The program plan was the *Draft Quality Assurance Project Plan for the Pebble Project Meteorological Monitoring Program*. This systems audit consisted of a review of this document, site visits and personnel interviews. Personnel were also observed during station maintenance and calibration operations. All aspects of the program not specifically mentioned in the Plan were reviewed to determine consistency with EPA and ADEC guidelines. The complete systems audit report contained in Appendix A is organized into six major sections; 1) General Program Information, 2) Monitoring Program Staff Organization, 3) Meteorological Monitoring Station Equipment, 4) Standard Operating Procedures, 5) Documentation, 6) Data Processing and Validation, 7) Quality Assurance and Quality Control (QA/QC), and 8) Comments and Suggestions. Each section consists of a question-answer format with additional comments to provide clarity. Flow charts are also used to accurately document program staff organization and the data handling process. A complete list of the references used for the systems audit is contained in Section 4.

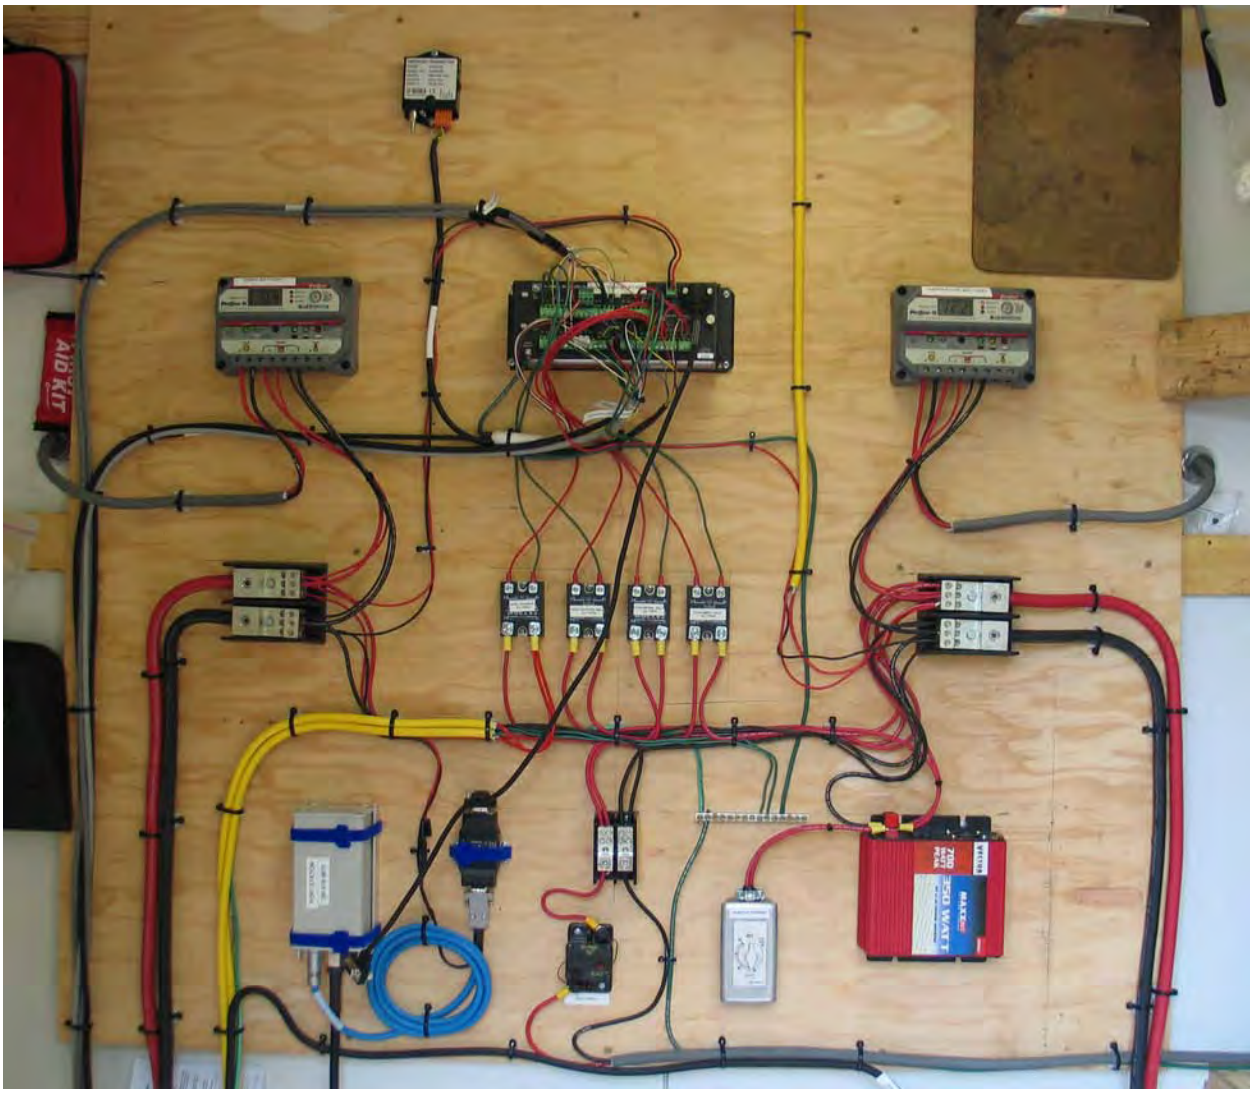
2.2 Meteorological Station On-Site Systems Audit

The on-site systems audit of the Pebble Port Station was conducted on June 25, 2005. Eric Brudie of HCG completed the systems audit with Steve Mackey and Jared Cockman of HCG and Robert Parks of NDM assisting and witnessing. Mr. Brudie serves as an independent auditor on this project and is not involved with day to day operations of the station.

The Pebble Port meteorological monitoring station is founded on a stable, well anchored tower with PSD quality sensors securely affixed. In order to protect instrumentation wires from animals; 2” liquid-tight conduit runs from the 12’ height on the tower to the prefab building. The data acquisition system (DAS), communications system, solar

controllers and power distribution system are mounted on a 4' by 4' plywood wiring panel mounted in the building, see photo.

Figure 2-1 Pebble Port Station DAS Wiring Panel



The Campbell Scientific CR10X DAS wiring is well organized and needs no further discussion. Constant communication between the DAS and a dedicated polling computer in the HCG office is integral to this installation. A Campbell Scientific SC932A interface converts the DAS signal to a RS-232 DCE modem signal. Three FreeWave spread spectrum radio modems transmit the signal to a SixNet industrial phone modem which is linked to the grid near Seldovia, Alaska. The met station radio and base radio rely on directional Yagi antennas focused on an omni-directional antenna at the repeater radio. The repeater radio is powered by one 35-Watt solar panel buffered through a solar controller and five 100 Amp-Hr deep cycle gel cell batteries.

Power generation at the meteorological monitoring station consists of four 50-Watt solar panels and a 21-Watt Global Thermoelectric Model 5030 Thermo-Electric Generator (TEG). One solar panel is dedicated to the DAS and meteorological instrumentation; wired through a Morningstar ProStar-15 solar controller and buffered through two 200 Amp-Hr deep cycle gel cell batteries. Three panels are dedicated to the aspirator fans, Climatronics heaters, shelter lighting and 120VAC power; wired through a Morningstar ProStar-15 solar controller and buffered through two 200 Amp-Hr deep cycle gel cell batteries. The shelter lights and 120VAC inverter for laptop use are routed through manual timers to ensure use only when operators are on site. During the winter months, November through April, the TEG is turned on to supplement the aspirator/heater power system. Aspirator fans and heaters are controlled through relays connected to the DAS control ports. Logic programmed into the DAS reduces power consumption by limiting heater use to weather conditions conducive to icing and turns fans off at night when voltage is low, considered an upset condition. Also the TEG power is routed through relays which shunt power to the critical DAS/sensor system during upset conditions.

2.3 Operations, Data Management and Documentation Systems Audit

This phase of the systems audit consists of a review of the HCG *Draft Quality Assurance Project Plan for the Pebble Project Meteorological Monitoring Program* (Plan), and other system documentation, and a review of system operations. System operations include physically running the station and subsequent data management.

The Plan is a comprehensive document which adequately details the Pebble meteorological monitoring program. Program objectives, installations, operations, data management and quality assurance are all clearly outlined. Equally, the Pebble Port Station is representative of the Plan design. The Plan provides standard operating procedures and standard forms for all equipment field calibrations and audits. Station operators also had complete DAS and meteorological sensor manuals on hand at the station. Plan and documentation review are covered further in Appendix A.

Station operators were observed during calibration and maintenance procedures and appeared knowledgeable about all facets of operating the monitoring station. Data are downloaded daily using an automated script on a dedicated polling computer located at the HCG office. The raw data are appended to a station file located on the HCG server, which is backed up daily. The data manager copies the raw data to a custom Access/Excel database, leaving the raw data unaltered. The custom database creates a series of graphs of all meteorological data as well as some station operational parameters. These plots are reviewed 5-6 days per week in order to immediately

identify station upsets. An example is a graph of solar radiation and battery voltage; which reveals potential problems with daily charge cycles. Both the Climatronics and RM Young Wind sensor data are plotted together to indicate problems with one of the sensors. All station parameters are plotted with ranges and pairings intended to best reveal upset conditions. Problems are immediately identified and corrective action planned and executed. Steps are taken to flag data which may have been identified as suspect during this graphical data review. Data generated during station maintenance, audits and calibrations are also flagged as invalid.

Prior to compilation of data summary reports, data are screened using EPA recommended screening criteria. Data flagged as outliers by the screening program are further reviewed for consistency with prevailing conditions and then permanently invalidated or validated. Data ultimately invalidated are permanently removed from the database and the reasoning is codified in a special column in the database. This cleaned dataset is used for all subsequent data summaries, wind roses, data reports and capture rate calculations. More detailed discussion of the operations and data management are contained in the Systems Audit Appendix A.

2.4 Comments and Suggestions

The Pebble Port Station is a well designed and operated meteorological monitoring station. The remote station is equipped with a robust and sophisticated power supply. The systems audit revealed that HCG possesses the necessary organization, personnel, training, equipment, quality assurance, and quality control procedures to accurately collect and report PSD quality data. HCG adequately maintains the Pebble Port Station and practices sufficient data review and preventive maintenance to avoid unnecessary data loss.

The following recommendations are made to the program in order to improve the operation of the stations and ensure their operation is in accordance with standards:

- Create custom site visit checklists
- Keep a file on site containing copies of previous checklists.

3.0 PERFORMANCE AUDIT

3.1 Performance Audit Methodology

During the performance audit, the station datalogger is interfaced with a portable laptop computer to display the outputs for the meteorological sensors. The value of each meteorological sensor is compared to the output value from the appropriate piece of audit equipment or from calibrated instruments collocated with the sensor. The difference between the station's datalogger reading and the output from each audit instrument is compared with established PSD limits to determine the accuracy of each sensor. Additionally, threshold torques for wind speed and wind direction are measured with audit equipment and compared with manufacturer torques corresponding to the PSD threshold speed of 0.5 m/s. Table 3-1 provides a summary of the performance audit methods and limits used to audit each parameter at the stations.

Table 3-1 Performance Audit Methods and Acceptable Limits

Parameter	Audit Method	EPA/Manufacturer Limit
Datalogger Time	NOAA Clock	≤ ±5:00 minutes from AST
Temperature Accuracy	Collocated NIST thermistor	≤ ±0.5 °C
Temperature Difference	Collocated NIST thermistor	≤ ±0.1 °C
Wind Speed Accuracy	Synchronous rpm motor	≤ ±0.2 m/s + 5 % observed
Wind Spd Torque (Clim)	Torque watch	≤ 0.35 g-cm (0.0049 oz-in)
Wind Spd Torque (RMY)	Torque watch	≤ 1.0 g-cm (0.014 oz-in)
Wind Direction Alignment	GPS, compass or landmark	≤ ±5° from true azimuth
Wind Direction Accuracy	Linearity tester	≤ ±5° per audit point
Wind Direction Linearity	Linearity tester	≤ 3° mean absolute average
Wind Dir Torque (Clim)	Torque watch	≤ 7.5 g-cm (0.104 oz-in)
Wind Dir Torque (RMY)	Vane torque gauge	≤ 11 g-cm (0.153 oz-in)
Relative Humidity	Collocated NIST RH sensor	≤ ±1.5 °C of dew point
Barometric Pressure	Collocated NIST BP sensor	≤ ±3 mbar
Solar Radiation[1]	Collocated NIST sensor	≤ ±5% of input+resolutuion[2]

1. Solar radiation not audited.
2. This audit limit is modified from PSD standard, as discussed below.

3.1.1 Data Acquisition System

An audit of the datalogger is conducted by comparing all datalogger outputs to the audit standards, as described below. The datalogger time is checked against an instantaneous time reading from the National Oceanic and Atmospheric Administration (NOAA) clock in Boulder, Colorado, via a global positioning system (GPS) handheld unit or telephone contact with the NOAA clock.

3.1.2 Air Temperature and Air Temperature Difference

The 2-meter and 10-meter thermistors are removed from their aspirator shields and collocated with a National Institute of Standards and Technology (NIST) traceable digital thermometer. The station thermistors and the transfer standard NIST thermometer are taped together and immersed in insulated thermoses containing a series of water baths; hot water (35°C to 45°C), warm water (15°C to 25°C), and a water/ice bath (0°C). Each water bath is agitated and allowed to equilibrate before simultaneous readings are taken from the three instruments. The difference between the individual station thermistors and the NIST standard are compared to the PSD temperature accuracy limit of ±0.5°C. The difference between the two station thermistors (10-m°C minus 2-m°C) is compared to the PSD temperature difference limit of ±0.1°C.

3.1.3 Wind Speed

Anemometers are audited to determine their accuracies in reading known wind speeds and to ascertain the sensor's threshold torque. The Climatronics and RM Young sensors are audited in very similar manners and are discussed together. The instruments are tested after removal from the tower and after removal of the sensor's props or cups.

First, an RM Young synchronous motor is attached to the shaft of the anemometer by using brand specific coupling devices. The sensor shaft is rotated at several different known revolutions per minute (rpm). Each rotational speed in rpm is equated to a wind speed in meters per second (m/s) by using the anemometer manufacturer's linear calibration formula. The difference between the calculated input speed in m/s and the datalogger output is compared to established PSD limits for each input rpm.

Next, a high precision torque watch is attached to the shaft of the anemometer, once again using custom couplings. Torque readings are made in both directions in each quadrant along the axis of rotation of the shaft. The maximum reading is recorded for the torque required to turn the shaft of the anemometer. The torque value recorded

during the audit is compared to manufacturer's torque corresponding to the minimum PSD threshold speed of 0.5m/s.

3.1.4 Wind Direction

The wind direction sensors are first audited as-found to determine the accuracy of their alignment with respect to true north (true azimuth alignment) using one of four methods. In one method, a handheld GPS unit is used to measure the position of the auditor with respect to a waypoint captured under the wind sensor's position on the tower. Using binoculars, the tail of the wind vane is aligned with the auditor's position at a distance of several hundred feet from the tower. The GPS bearing back to the tower waypoint is then compared to the DAS reading. The difference between the two should not exceed ±5° per audit point. This procedure is repeated at least 4 times, once per quadrant, generally near the cardinal directions. The second method uses a calibrated precision compass mounted on a gimbal and tripod. The compass declination is preset for the specific location and date using one of a variety of magnetic declination computer models. The sensor tail is aligned toward the auditor while auditor sights the compass toward the sensor and readings are taken in a similar manner to the GPS method.

Another option is to align the tail of the sensor with a distant identifiable landmark of know bearing. The bearing to the landmark may be ascertained using a variety of methods. One method involves physically capturing a distant GPS waypoint, such as at a discernable structure or emissions stack. Bearings to inaccessible natural landmarks, usually distant mountain peaks, are acquired through the use of various computer mapping programs, such as Natural Geographic's TOPO program or USGS digital raster graphics (DRGs) loaded into AutoCAD. The bearing from the station location to the landmark is compared to the DAS reading. This method yields the most accurate audit value, but is limited by weather and availability of discernable landmarks. The final method is to align the vane with the tower guy wires or preset survey markers, whose bearing has been ascertained using precision survey equipment.

The wind direction accuracy and linearity are subsequently audited after the wind direction sensor is removed from the tower. The Climatronics sensor is mounted on a Climatronics Model 101984 linearity tester and the RM Young sensor is mounted on an RM Young Model 18112 Vane Angle Bench Stand. Both test fixtures are keyed to their respective sensor and graduated from 0° to 360°. A series of readings starting at 30° and then clockwise in 30° increments are taken. The RM Young is read from 30° to 360° and the Climatronics is read from 30° to 540°. The Climatronics sensor is tested 180° past 360° in order to test the second potentiometer used in some DAS

programming. Although not required, the Climatronics sensor is also tested with the vane attached in order to ascertain sensor accuracy and linearity relative to the instrument crossarm. The vane is aligned along the axis of the crossarm to yield the 0°/360° and 180° values and against a square held to the crossarm for the 90° and 270° directions. Four readings are taken in a clockwise direction and four are taken counterclockwise to complete the test. For both the linearity test fixture and crossarm tests, individual error values are assessed for the PSD accuracy limit of ±5° per point and the mean absolute average error is assessed against the linearity limit of 3°.

Next, the RM Young wind direction threshold is tested by measuring wind vane torque using an RM Young Model 18331 Vane Torque Gauge. This device saddles the wind vane and a calibrated spring is pulled to determine maximum torque from readings taken in both directions in all four quadrants. The Climatronics wind direction starting torque is measured with the vane removed by using a precision torque watch in the same manner as the wind speed torque. The highest torque readings are compared to specific manufacturer limits for instrument staring torque.

Finally, the wind direction sensors are placed back on the tower and as-left audits of the azimuth alignments are conducted to ensure the instruments are properly reinstalled.

3.1.5 Relative Humidity

Relative humidity (RH) is audited using a collocated NIST traceable RH sensor. The NIST sensor and the field sensor are collocated out of direct sunlight to eliminate solar radiation effects, preferably inside of the motor aspirated shield. If the NIST standard reads directly in dew point °C, those readings are used; if not, relative humidity and temperature readings are used. For the audit, instantaneous readings of dew point, relative humidity and temperature are recorded from the transfer standard and the DAS. All relative humidity and temperature readings are converted to dew point in order to assess the PSD error limit of ±1.5°C dew point.

3.1.6 Barometric Pressure

Barometric pressure (BP) is audited using a collocated NIST traceable BP sensor. The difference between the NIST sensor and the station sensor are compared to the PSD limit of ±3 mbar.

3.1.7 Solar Radiation

Outputs of the station sensor are compared to the output of a level collocated audit solar radiation sensor. The audit sensor is connected to an independent audit datalogger with the scan interval and clock synchronized with the station DAS. Hourly

average solar radiation readings and instantaneous readings are recorded during the audit and then input into a custom spreadsheet to calculate a linear regression for the data. The PSD limit for solar radiation audits is ±5% of observed, but this standard is very difficult to obtain at the northern latitude of this installation. This EPA standard is currently undergoing review and is expected to change. A well excepted substitute is that individual DAS and audit data pairs are compared to a limit of ±5% of observed **+ EPA minimum instrument resolution (10W/m²)**. Individual data pairs are evaluated against this standard, but the overall set is restricted to a 5% error by limiting allowable linear slope to 1.0±0.05.

3.2 Performance Audit Results

The initial performance audit was conducted at the Pebble Port Station on June 25, 2005, shortly after startup. Steve Mackey and Jared Cockman of HCG and Robert Parks of NDM assisted. The relative humidity sensor and barometric pressure sensor were audited on July 19, 2005 because the transfer standards were not available in June. All sensors, except the solar radiation sensor, were challenged with certified audit equipment and yielded errors below the PSD limits. The solar radiation audit was not completed because adequate audit equipment was not available at the time of the audit. Summary audit results are contained in Table 3-2 and complete audit reports and audit equipment calibration certificates are contained in Appendix B and Appendix C respectively.

3.3 Performance Audit Recommendations

- None.

Table 3-2 Port Station June 25, 2005 & July 2005 Performance Audit Summary

Parameter	Limit	Units	Max Err	Status
Datalogger Time	≤ ±5:00	Min:Sec	0:02	Pass
2-m Temperature Accuracy	≤ ±0.5	°C	0.35	Pass
10-m Temperature Accuracy	≤ ±0.5	°C	0.30	Pass
Air Temperature Difference	≤ ±0.1	°C	-0.05	Pass
Climatronics Wind System				
Wind Speed Torque	≤ 0.0049	oz-in	<<0.003	Pass
Low Wind Spd. Accuracy (≤5m/s)	≤ ±0.2	m/s	0.00	Pass
High Wind Spd. Accuracy (>5m/s)	≤ ±5	% input	0.0	Pass
Wind Direction Torque	≤ 0.104	oz-in	0.060	Pass
Wind Dir. Azim. Align. (as-found)	≤ ±5	Degree	-1.8	Pass
Wind Direction Accuracy	≤ ±5	Degree	1.9	Pass
Wind Direction Linearity	≤ 3	Degree	0.9	Pass
Wind Dir. Azim. Align. (as-left)	≤ ±5	Degree	N/A[2]	N/A
RM Young Wind System				
Wind Speed Torque	≤ 0.014	oz-in	0.006	Pass
Low Wind Spd. Accuracy (≤5m/s)	≤ ±0.2	m/s	0.00	Pass
High Wind Spd. Accuracy (>5m/s)	≤ ±5	% input	0.0	Pass
Wind Direction Torque	≤ 11	g-cm	5.0	Pass
Wind Dir. Azim. Align. (as-found)	≤ ±5	Degree	1.3	Pass

1.0 GENERAL PROGRAM INFORMATION

1.1 Site Description

The Pebble Port tower is located near the middle of a small point on the west shore of Iniskin Bay. The 50' high point is approximately 75' wide and 150' long and is vegetated with Alders, low shrubs and small Spruce trees. East of the station are the waters of Iniskin Bay and to the west the topography rises steeply to almost 3,000'.

1.2 Site Location

1.2.1 Coordinates

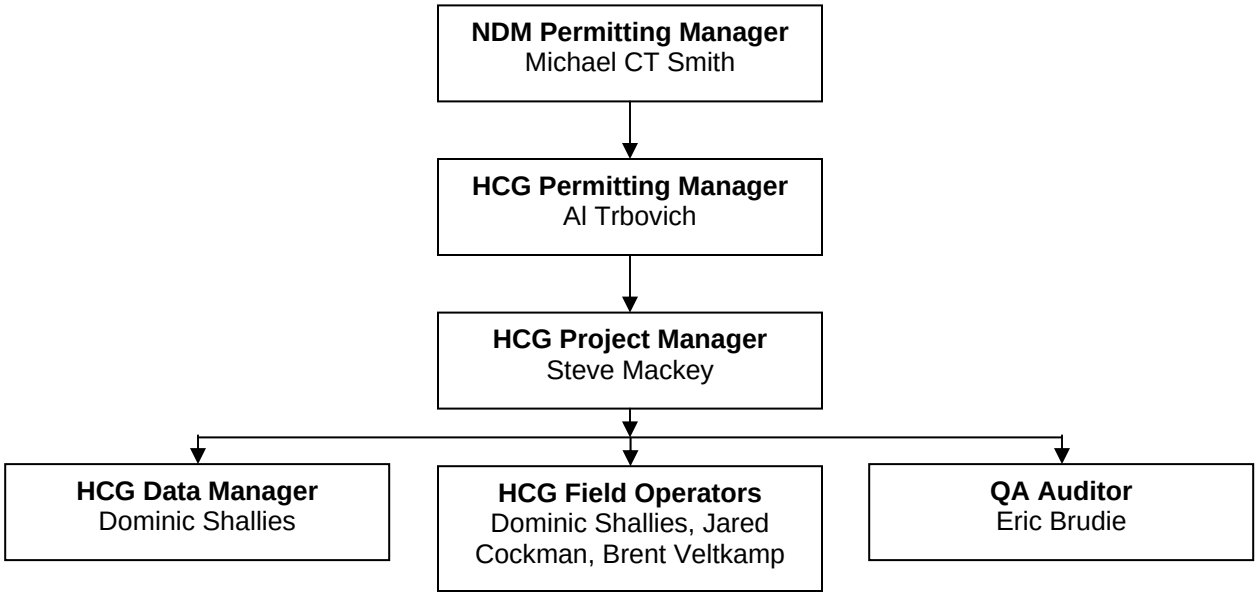
Indicated by Operator	Determined by Auditor
59° 39' N	59° 38.959' N
153° 28' W	153° 28.314' W
Elevation: 40 feet	Elevation: 50 feet

1.2.2 Appearance and Safety

Does the site appear clean, organized and well maintained?	■ Yes □ No	Comments: None.
Does the site appear to be safe and reasonably hazard free?	■ Yes □ No	Comments: None.
Does the site have a shelter for operators?	■ Yes □ No	Comments: None.
Does the site have emergency equipment such as a first aid kit available?	■ Yes □ No	Comments: None.
Does the site have adequate measures to prevent human tampering?	■ Yes □ No	Comments: 6' fence surrounds station.
Does the site have adequate measures to prevent damage from animals?	■ Yes □ No	Comments: Cables protected in liquid-tight conduit and electronics inside shelter.

2.0 MONITORING PROGRAM STAFF ORGANIZATION

- Draw diagram indicating the organizational structure of the monitoring program. Include names and titles:



3.0 METEOROLOGICAL MONITORING STATION EQUIPMENT

3.1 Inventory

Parameter	Make	Model	Serial No.
DAS	Campbell Scientific	CR10X	X41611
DAS Wiring Panel	Campbell Scientific	CR10X	31375
Temperature (2-meter)	Met One	062MP	E3381, ID #1/2
Temperature (10-meter)	Met One	062MP	E3381, ID #2/2
Temperature Aspirators	Met One	076B-4	Unknown
Primary Wind Speed	Climatronics	F460-100075	5008
Primary Wind Speed Cups	Climatronics	HD Al. P/N 101287	2285
Primary Wind Direction	Climatronics	F460-100076	4690
Primary Wind Direction Vane	Climatronics	HD P/N 101288	1425
Wind Sigma	Campbell Scientific	DAS Calculated	N/A
Backup Wind Speed	RM Young	05305 Wind Mon-AQ	67055
Backup Wind Speed Prop	RM Young	08254	63037
Backup Wind Direction	RM Young	05305 Wind Mon-AQ	67055
Relative Humidity	Vaisala	HMP45AC	A2120081
Barometric Pressure	Vaisala	PTB101B	A1950006
Solar Radiation	LI-COR	Li-200SX	PY50763

3.2 Equipment Evaluation

3.2.1 Data Acquisition System (DAS) and Communications System

Is the DAS well protected from the elements with adequate room for maintenance?	■ Yes □ No	Comments: DAS inside of a weatherproof building, mounted on a 4'x4' wiring panel.
Is the DAS rated for operation in the expected local temperature range?	■ Yes □ No	Comments: -55°C to + 85°C.
Are all sensor cables neatly and securely connected to the correct DAS channels?	■ Yes □ No	Comments: Well organized wiring panel.
Is remote communication to the DAS system available to operators?	■ Yes □ No	Comments: DAS to SC932A interface to FreeWave RF network to SixNet modem.
Are all components of the DAS and communications system operational?	■ Yes □ No	Comments: None.
Are the DAS and communication equipment properly grounded?	■ Yes □ No	Comments: 8' ground rod wired to central ground buss.
Are the DAS and communication equipment protected from lightning?	□ Yes ■ No	Comments: There is no lighting protection, but area not prone to strikes.

3.2.2 Power Supply System

Does the system have a stable power supply or line power?	■ Yes □ No	Comments: Very robust alternative power supply described below.

- Describe the meteorological monitoring station power supply system.

The DAS, communications equipment and meteorological sensors are powered by one 50-Watt solar panel, buffered through two 200 amp-hr deep cycle gel cell batteries. The aspirator fans and Climatronics wind sensor heaters are powered by three 50-Watt solar panels buffered through two 200 amp-hr deep cycle gel cell batteries. During the winter months (November through April), the aspirator/heater system is also powered by a 21-Watt propane Thermo-Electric Generator (TEG). The isolated DAS and Aspirator power systems can be interconnected during upset conditions through an array of relays managed through the DAS control ports. The DAS monitors battery levels and can shunt the two power systems should one run low. The DAS also has algorithms programmed to assess weather conditions and limit heater use when not required.

3.2.3 Meteorological Monitoring Sensors

Do all sensors appear to be clean, intact, in good condition and well maintained?	■ Yes □ No	Comments: None.
Are all sensors operational, online and reporting data?	■ Yes □ No	Comments: None.
Do all sensors meet EPA criteria for PSD quality sensors?	■ Yes □ No	Comments: See table below.
Are spare parts stocked for items which are frequently worn out or broken?	■ Yes □ No	Comments: Spare props, cups and vanes onsite and spare bearings at HCG office.

3.2.4 EPA PSD Meteorological Instrument Standards

Parameter	Instrument Specifications	EPA Standard	Pass?
Air Temperature (2-M, 10-M & Delta-T) – Met One Mdl. 062MP			
Accuracy (2-m & 10-m):	±0.05 °C	±0.5 °C	Yes
Accuracy (Delta-T):	±0.02 °C	±0.1 °C	Yes
Range (Operating Temp):	-50°C to +50°C	-20°C to +30°C	Yes
*Resol. (2-m & 10-m):	0.01°C	0.1°C	Yes
*Resolution (Delta-T):	0.01°C	0.02°C	Yes
Response Time:	10 seconds	≤1 minute	Yes
Wind Speed – Climatronics Mdl. F460-100075			
Accuracy:	±0.07 m/s or ±1% of obs.	±0.2 m/s + 5% of observed	Yes
Range:	0.0 m/s to 65 m/s	0.5 m/s to 50 m/s	Yes
*Resolution:	0.01m/s	0.1 m/s	Yes
Threshold Speed:	0.22 m/s	≤0.5 m/s	Yes
Distance Constant:	<4.0 m (HD Alum. Cups)	≤5 m	Yes
Operating Temperatures:	-40°C to +60°C	-30°C to + 30°C	Yes
Wind Direction – Climatronics Mdl. F460-100076			
Accuracy:	±2°	±5°	Yes
Range:	0° to 360°	0° to 360°	Yes
*Resolution:	0.1°	1°	Yes
Threshold Speed:	0.22 m/s	≤0.5 m/s	Yes
Distance Constant:	<2.5 m (Heavy Duty Vane)	≤5 m	Yes
Damping Ratio:	>0.4 @10° initial angle	0.4 to 0.7	Yes
Operating Temperatures:	-50°C to +60°C	-30°C to + 30°C	Yes
Wind Speed – RM Young Mdl. 05305 Wind Monitor-AQ			
Accuracy:	±0.2 m/s or 1% of observed	±0.2 m/s + 5% of observed	Yes
Range:	0.0 m/s to 50 m/s	0.5 m/s to 50 m/s	Yes
*Resolution:	0.01m/s	0.1 m/s	Yes
Threshold Speed:	0.4 m/s	≤0.5 m/s	Yes
Distance Constant:	2.1 m	≤5 m	Yes
Operating Temperatures:	-50°C to +50°C	-30°C to + 30°C	Yes
Wind Direction – RM Young Mdl. 05305 Wind Monitor-AQ			
Accuracy:	±3°	±5°	Yes
Range:	0° to 360°	0° to 360°	Yes
*Resolution:	0.1°	1°	Yes
Threshold Speed:	0.5 m/s @10° displacement	≤0.5 m/s	Yes
Distance Constant:	1.2 m	≤5 m	Yes
Damping Ratio:	0.45	0.4 to 0.7	Yes
Operating Temperatures:	-50°C to +50°C	-30°C to + 30°C	Yes
Relative Humidity – Vaisala Mdl. HMP45AC			
Accuracy:	±2/3% at 0-90/90-100% RH	±1.5°C Dew Point**	Yes
Range:	0.8% to 100% RH	-30°C to +30°C Dew Point**	Yes
*Resolution:	0.1% RH	1% RH	Yes
Response Time:	10 sec	≤30 minutes	Yes
Operating Temperatures:	-40°C to +60°C	-30°C to + 30°C	Yes
** EPA criteria in units of dew point, RH and operating temperature ranges meet these criteria.			
Barometric Pressure – Vaisala Mdl. PTB101B			
Accuracy:	±0.5 mbar	±3 mbar	Yes
Range:	600 mbar to 1060 mbar	Not Specified	N/A
*Resolution:	0.1 mbar	0.5 mbar	Yes
Response Time:	300 msec	Not Specified	N/A
Operating Temperatures:	-40°C to +60°C	Not Specified	N/A

EPA Recommended Meteorological Instrument Standards (Continued)

Parameter	Instrument Specifications	EPA Standard	Pass?
Solar Radiation – LI-COR Mdl. Li-200SX Pyranometer			
Accuracy:	±5% Observed	±5% Observed	Yes
Range:	0 W/m^2 to 3000 W/m^2	Not Specified	N/A
*Resolution:	1 W/m^2	10 W/m^2	Yes
Response Time:	10 µs	5 seconds	Yes
Spectral Response:	400 nm to 1,100 nm	285 nm to 2800 nm	No
Operating Temperatures:	-40°C to +65°C	-20°C to +40°C	Yes
* For all instruments; resolutions are the result of instrument type, configuration and DAS programming.			

3.3 Station Location and Siting

3.3.1 Tower

Do all obstructions exist below a 1:10 slope away from the tower base? ■ Yes □ No Comments: None.

Is the height of the tower 10 meters above the ground? ■ Yes □ No Comments: None.

Is the tower stable and plumb? ■ Yes □ No Comments: None.

Is the tower protected from lightning? □ Yes ■ No Comments: There is no lighting protection, but area not prone to strikes.

3.3.2 Temperature and Relative Humidity Sensors

Are the sensors mounted at least 2-m above open level ground at least 9-m in diameter? ■ Yes □ No Comments: None.

Are the temperature difference probes at heights of 2-m and 10-m above the ground? ■ Yes □ No Comments: None.

Are the sensors at a distance greater than four times the height of any obstruction? ■ Yes □ No Comments: None.

Is the ground beneath the temperature sensors natural native material? ■ Yes □ No Comments: None.

Is the site free of any natural features that could bias temperature data (e.g. open water, sloping ridge, etc.)? ■ Yes □ No Comments: None.

Is the site free of any man-made features that could bias temperature data (e.g. asphalt, concrete, exhaust plumes, etc.)? ■ Yes □ No Comments: None.

Are the sensors located at least 30 meters from large paved areas? ■ Yes □ No Comments: None.

Is the ambient temperature sensor protected from the influence of solar radiation? ■ Yes □ No Comments: Housed in Met One Mdl 076B-4 Motor Aspirated Radiation Shield.

Are the temperature difference sensors located in identical aspirated shields? ■ Yes □ No Comments: Housed in Met One Mdl 076B-4 Motor Aspirated Radiation Shields.

3.3.3 Wind Speed and Wind Direction Sensors

Is the horizontal distance between the instruments and any obstruction at least 10 times the height of the obstruction?	■ Yes □ No	Comments: None.
Are the instruments at least 1.5 times nearby building height(s) above the building roof(s), or 10-m high?	■ Yes □ No	Comments: None.
Are the wind speed and wind direction sensors stable and plumb?	■ Yes □ No	Comments: None.
Is the distance of the sensor on the cross-arm at least twice the diameter of the tower?	■ Yes □ No	Comments: Climatronics Sensors mounted on a crossarm which meets this criterion.
Is the distance of the sensor on the cross-arm at least twice the diameter of the tower?	■ Yes □ No	Comments: RM Young sensor mounted on an extension arm which meets this criterion.
Is the wind direction sigma theta data being collected according to EPA requirements?	■ Yes □ No	Comments: DAS calculated using Yamartino method and a one-second scan interval.

3.3.4 Relative Humidity and Barometric Pressure

Is the relative humidity sensor open to the atmosphere & protected from precipitation?	■ Yes □ No	Comments: Housed in 2-m aspirated shield with temperature sensor.
Is the barometric pressure sensor open to atmosphere & protected from precipitation?	■ Yes □ No	Comments: Housed in unsealed shelter, mounted on wiring panel.

3.3.5 Solar Radiation

Is the instrument situated above the plane of any obstructions that could cast shadows?	■ Yes □ No	Comments: None.
Is the sensor situated south of the tower to minimize obstruction from the tower?	■ Yes □ No	Comments: None.

4.0 STANDARD OPERATING PROCEDURES

4.1 General

Is the station visited on a preset schedule?	■ Yes □ No	Comments: None.
Have standard SOPs been developed, and are they being followed by the operators?	■ Yes □ No	Comments: None.
Does the operator follow a preventative maintenance schedule?	■ Yes □ No	Comments: None.
Are site visits and maintenance activities properly documented in a Station Log?	■ Yes □ No	Comments: Site visit memos are compiled.
Are station operators knowledgeable and competent regarding effective operation?	■ Yes □ No	Comments: None.
Have operators attended any formal training for operating met monitoring stations?	□ Yes ■ No	Comments: All operators have one to two years onsite experience.

Are copies of the NIST certifications for the calibration equipment made available?	■ Yes □ No	Comments: Attached.

4.2 DAS and Meteorological Sensors

Are regular multipoint QC checks performed on the DAS?	■ Yes □ No	Comments: DAS audited by virtue of the instrument output values.
Are regular multipoint QC checks performed on the meteorological sensors?	■ Yes □ No	Comments: None.
Are the sensors visually inspected for defects and problems?	■ Yes □ No	Comments: None.
Are ambient conditions compared with sensor readings from the DAS?	■ Yes □ No	Comments: DAS output compared to Iliamna Airport weather station.
Are data frequently reviewed for reasonableness and completeness?	■ Yes □ No	Comments: None.
Is a copy of the datalogger program made available for review?	■ Yes □ No	Comments: None.

5.0 DOCUMENTATION

5.1 System Reference and Maintenance Manuals

Does the operator have all required DAS and meteorological instrument manuals?	■ Yes □ No	Comments: On-site and at HCG offices.
Does the operator have configuration and wiring schematics specific to the station?	■ Yes □ No	Comments: Operator carries wiring schematics.

5.2 Station Monitoring Plan and Report Forms

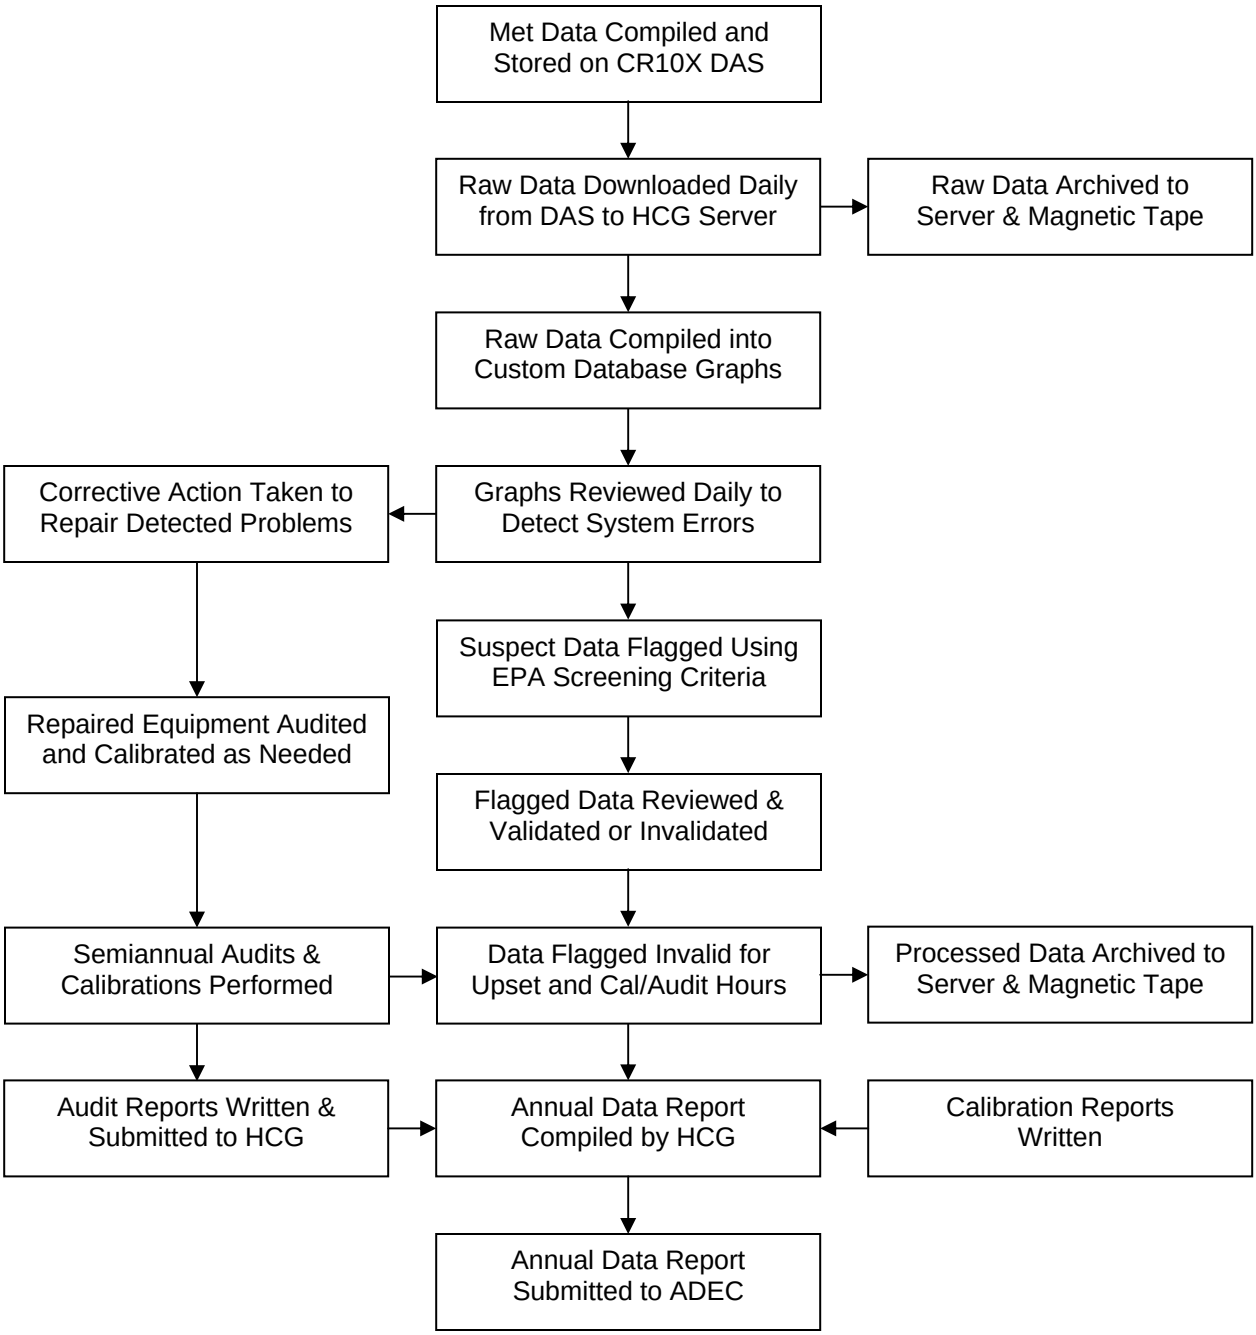
Is the Monitoring/QA plan comprehensive and reflective of the actual installation?	■ Yes □ No	Comments: None.
Does the Monitoring/QA plan indicate the intended use for the data collected during the monitoring program?	■ Yes □ No	Comments: Collect PSD quality data to meet dispersion modeling requirements and satisfy mine/transportation design requirements.
Does the system outlined in the QA plan meet the objectives outlined above?	■ Yes □ No	Comments: PSD quality installation.
Does the QA Plan indicate the intended schedule for reports to be submitted?	■ Yes □ No	Comments: None.
Does the station have an activity log?	□ Yes ■ No	Comments: Site visit memos written after each visit to supplant a log book.
Does the station have a formal Site Visit and Checklist Form?	□ Yes ■ No	Comments: No formal checklist used.
Does the station have an adequate Operations Manual?	■ Yes □ No	Comments: Monitoring/QA plan and equipment manuals.

Does the station have an adequate Calibration Report Form and copies of previous calibrations and audits?	■ Yes □ No	Comments: None.
Are report forms and site logs properly completed and current?	■ Yes □ No	Comments: None.

6.0 DATA PROCESSING and VALIDATAION

6.1 Overall Data Management

- Diagram the flow of data from monitoring equipment to submission of a final report.



6.2 Data Collection and Initial Data Review

Is the station polled and data downloaded on a regular basis?	■ Yes □ No	Comments: Daily via RF modem and telephony modem.
Are the monitoring station data reviewed on a regular basis?	■ Yes □ No	Comments: Data imported into custom graphs and reviewed 5-6 days per week.
Are the monitoring station data screened on a regular basis?	■ Yes □ No	Comments: Data screened using EPA criteria prior to summary compilations.
Are procedures in place for backing up raw data?	■ Yes □ No	Comments: Raw data files are backed up on the HCG server and on magnetic tape.
Are written procedures for data handling available for the project?	■ Yes □ No	Comments: None.

- Describe the data polling process and initial data evaluation.

Data is downloaded from the station on a daily basis using a dedicated data polling computer located at the HCG office. The raw *.dat file is appended to the existing raw station data file located on the HCG server, which is backed up to tape daily. The raw data are copied to an Access/Excel database file which generates custom graphs of the various meteorological and operational parameters. These graphs are reviewed 5-6 days per week in order to identify station problems. This graphical data review is the frontline of maintaining a complete and defensible dataset. Station upsets are instantly identified and repaired within days. Copies of both the raw unadjusted data and the custom database files are retained for a minimum of 5 years.

6.3 Corrective Actions

Are procedures established for initiating corrective actions during data processing?	■ Yes □ No	Comments: Daily graphical data review and subsequent reactions.

- Describe procedures for initiating, tracking and closing corrective actions.

When nonconformance issues are recognized during graphical review, the Lead Operator/Data Manager plans and executes corrective action. A calibration check is performed on any sensor which is repaired or replaced during the action. A site visit memo outlining the nature of the problem and repairs undertaken is written and saved to the station file. Any quantifiable error is also documented for possible data validation. The Operator/Data Manager ensures the erroneous data are flagged for the period from initial noncompliance until repair and calibration.

6.4 Data Validation

Are data validation procedures established and in use?	■ Yes □ No	Comments: None.
Are adjusted and unadjusted data sets maintained?	■ Yes □ No	Comments: Both are backed up on the HCG server and magnetic tape.

- Describe the initial data validation procedure.

Data is compiled in a custom Excel spreadsheet programmed to evaluate meteorological data against EPA recommended PSD data screening criteria. The data are screened for events such as; extended periods of zero wind speed (indicating icing or worn bearings), temperatures outside of the known monthly max/min for the area, etc. Nonconforming data are flagged by the screening program for further investigation. Also, data periods for individual parameters are flagged for times when the corresponding instrument was undergoing field servicing, calibrations or audits. Periods when instruments are known to have been out of calibration or malfunctioning are also flagged.

- Describe procedures for validating and invalidating flagged data (outliers).

Data flagged during the screening process described above are manually reviewed. If the data have a quantifiable, consistent and documented bias, they may be adjusted and then validated. Specific guidelines are detailed in the Plan. Data which have been flagged by the screening program are also compared to local weather conditions as determined from other sources. Examples where data flagged during screening may be validated include periods when winds were known to have been exceptionally calm at nearby stations or extreme temperatures outside the historical max/min were witnessed. At this point, flagged data are permanently validated and left in the database or invalidated and removed from the database. Data removed from the database are replaced with an alphanumeric code to indicate the reason for invalidation.

- Identify those responsible for data validation.

Name: Dominic Shallies
Position: Lead Operator & Data Manager
Affiliation: Hoefler Consulting Group, Inc.

Name: Isaac Bertschi
Position: Data Management
Affiliation: Hoefler Consulting Group, Inc.

6.5 Data Capture

- Identify the desired data capture rate for the monitoring data.

Target rate for PSD Quality Meteorological Monitoring Data is 90%.

Is the desired data capture rate being met for each data type?	■ Yes □ No	Comments: None.

6.6 Data Reporting

Are quarterly and annual data reports being submitted for the site?	■ Yes □ No	Comments: None
Are qualified staff personnel reviewing data reports prior to submittal?	■ Yes □ No	Comments: None.
Is finalized data set submitted with report to ADEC?	■ Yes □ No	Comments: None.

7.0 QUALITY ASSURANCE AND QUALITY CONTROL

7.1 Quality Assurance Program

Has a quality assurance plan been written describing quality assurance procedures?	■ Yes □ No	Comments: None.
Is a copy of the plan available to field and data processing personnel?	■ Yes □ No	Comments: None.
Has the quality assurance plan been approved by the ADEC?	■ Yes □ No	Comments: None.

- Identify those person(s) responsible for updating the plan SOPs.

Name: Steve Mackey
Position: Project Manager
Affiliation: Hoefler Consulting Group, Inc.

7.2 Quality Assurance Methods and Audits

Have adequate audit procedures been identified within the quality assurance plan?	■ Yes □ No	Comments: None.
Does the Plan correctly document PSD accuracy limits for calibrating and auditing?	■ Yes □ No	Comments: None.
Have audits been conducted on the suggested schedule of every six months?	■ Yes □ No	Comments: None.

- Identify the person(s) responsible for conducting audits on the monitoring instrumentation.

Name: Eric Brudie
Position: Field Auditor
Affiliation: Hoefler Consulting Group, Inc.

8.0 COMMENTS AND SUGGESTIONS

- Prepare and compile site specific station checklists and visit forms.

APPENDIX B
PERFORMANCE AUDIT DATA SHEETS and ALIGNMENT MAP

METEOROLOGICAL STATION - INSTRUMENT PERFORMANCE AUDIT (11-M)

Owner: Northern Dynasty **Operator:** Dominic Shallies **Alternate:** Steve Mackey **Station Site:** Port
Auditor: Eric Brudie **Witness(s):** Steve Mackey, Jared Cockman, Robert Park **Audit Date:** 25-Jun-05

● *DAS TIME AUDIT*

PSD Limits: DAS time = Alaska Standard Time (AST) +/- 5 minutes.
Conversions: Winter; (AST) = (DST), Summer; (AST) = (DST) - 1 hr.
Comments: None.

DAS TIME vs. NOAA CLOCK			
AST Time	DAS Time	Error Min:Sec	Pass/ Fail?
15:05:00	15:05:02	**00:02**	**PASS**

● *TEMPERATURE SENSORS & ΔT AUDIT*

Lower Height: 2.0 **Meters** **Upper Height:** 10.0 **Meters**

2-M Thermistor: **Make:** Met One **Model:** 062MP **S.N.#:** E3381 # 1/2 **Range:** -50 to 50 **°C**
10-M Thermistor: **Make:** Met One **Model:** 062MP **S.N.#:** E3381 # 2/2 **Range:** -50 to 50 **°C**
Audit Digital Thermometer: **Make:** Van Waters & Rogers **Model:** 61220-601 **S.N.#:** 51091749 **Range:** -40 to 150 **°C**
Audit Probe: **Make:** Van Waters & Rogers **Model:** 61220-604 **S.N.#:** 51091789 **Range:** -40 to 150 **°C**

Begin: 1400
End: 1420

This Instrument was calibrated using Instruments Traceable to National Institute of Standards and Technology.

A Test Uncertainty Ratio of at least 4:1 is maintained unless otherwise stated and is calculated using the expanded measurement uncertainty. Uncertainty evaluation includes the instrument under test and is calculated in accordance with the ISO "Guide to the Expression of Uncertainty in Measurement" (GUM). The uncertainty represents an expanded uncertainty using a coverage factor k=2 to approximate a 95% confidence level. In tolerance conditions are based on test results falling within specified limits with no reduction by the uncertainty of the measurement. The results contained herein relate only to the item calibrated. This certificate shall not be reproduced except in full.

Wallace Berry

Wallace Berry, Technical Manager

Maintaining Accuracy:

In our opinion once calibrated your Digital Thermometer should maintain its accuracy. There is no exact way to determine how long calibration will be maintained. Digital Thermometers change little, if any at all, but can be affected by aging, temperature, shock, and contamination.

Recalibration:

For factory calibration and re-certification traceable to National Institute of Standards and Technology contact Control Company.

Certificate of Calibration

Report #: 101705-X0740015-RH **RMA #:** 95-49728 **Calibration Date:** Oct-17-2005
Model #: HMI41/HMP45 **Serial #:** X0650080 / X0740015
Instrument Type: Humidity Transmitter Calibration Procedure: 11603100
Instrument Range: 0 to 100%RH Recommended Calibration Due Date: Oct-17-2006

Customer: HOEFLER CONSULTING GROUP
City, State: ANCHORAGE, AK

This unit was calibrated by adjusting its reading at 0%* against a dry-air line and at 75% against reference humidity and temperature instrument, Vaisala model HMP233. Additional instrument verification checkpoints were made against HMP233 reference at 11%RH, 33%RH and 97%* RH. Calibration and instrument verification sequences utilize a dry-air line and a set of controlled aqueous salt solutions Vaisala model HMK13B. Laboratory ambient conditions are humidity and temperature controlled. The calibration uncertainty is presented at 95% confidence level, k=2. The standard uncertainty of the measurement has been determined in accordance with U.S. Guide to the Expression of Uncertainty in Measurement. *Note: the 0% and 97% RH points are not ISO17025 Accredited.

1.0 INTRODUCTION

Hoefler Consulting Group, Inc. (HCG) operates meteorological monitoring stations for Northern Dynasty Mines, Inc. (NDM) in support of the Pebble Mine Project near Iliamna, Alaska. The air monitoring program is one component of ongoing baseline environmental studies being conducted to support mine permitting, mine design and mine transportation infrastructure development. The stations meet Prevention of Significant Deterioration (PSD) guidelines, although PSD permits may not be required. This report covers the Port monitoring station located near the proposed mine port site.

The Pebble Port Station is located on the west shore of Iniskin Bay, near the southern end of the bay. The station is situated on a 50' high knoll, very near the water's edge. The Port Station consists of an instrumented 11-meter sectional tower secured with three guy wires. Approximately 20' south of the tower is a 6' by 8' insulated building which houses the datalogger and power supply system. The Pebble Port Station is instrumented with PSD quality sensors monitoring the following parameters:

- Ambient Temperature (ºC): Met One 062MP Thermistor Probe at 2-m
- Temperature Difference (ºC): Met One 062MP Thermistors at 2-m and 10-m
- Wind Speed 1 (m/s): Climatronics F460 P/N 100075 Wind Speed Sensor
- Wind Direction 1 (°): Climatronics F460 P/N 100076 Wind Direction Sensor
- Wind Speed 2 (m/s): RM Young 05305 Wind Monitor-AQ
- Wind Direction 2 (°): RM Young 05305 Wind Monitor-AQ
- Sigma Theta (°): Campbell Scientific CR10X DAS calculated (Yamartino)
- Relative Humidity (%RH): Vaisala HMP45AC Relative Humidity Sensor
- Barometric Pressure (mbar): Vaisala PT101B Barometric Pressure Sensor
- Solar Radiation (W/m2): LI-COR Li-200SX Solar Radiation Pyranometer.

This report has been prepared for NDM to serve as a quantitative review of the Pebble Port Station. To that end, a Performance Audit was undertaken in order to demonstrate that the equipment installed at the meteorological monitoring station is operating correctly and meets the requirements set forth by the U.S. Environmental Protection Agency (EPA) and the Alaska Department of Environmental Conservation (ADEC).

2.0 PERFORMANCE AUDIT

2.1 Performance Audit Methodology

During the performance audit, the station datalogger is interfaced with a portable laptop computer to display the outputs for the meteorological sensors. The value of each meteorological sensor is compared to the output value from the appropriate piece of audit equipment or from calibrated instruments collocated with the sensor. The difference between the station's datalogger reading and the output from each audit instrument is compared with established PSD limits to determine the accuracy of each sensor. Additionally, threshold torques for wind speed and wind direction are measured with audit equipment and compared with manufacturer torques corresponding to the PSD threshold speed of 0.5 m/s. Table 2-1 provides a summary of the performance audit methods and limits used to audit each parameter at the stations.

Table 2-1 Performance Audit Methods and Acceptable Limits

Parameter	Audit Method	EPA/Manufacturer Limit
Datalogger Time	NOAA Clock	≤ ±5:00 minutes from AST
Temperature Accuracy	Collocated NIST thermistor	≤ ±0.5 °C
Temperature Difference	Collocated NIST thermistor	≤ ±0.1 °C
Wind Speed Accuracy	Synchronous rpm motor	≤ ±0.2 m/s + 5 % observed
Wind Spd Torque (Clim)	Torque watch	≤ 0.35 g-cm (0.0049 oz-in)
Wind Spd Torque (RMY)	Torque watch	≤ 1.0 g-cm (0.014 oz-in)
Wind Direction Alignment	GPS, compass or landmark	≤ ±5° from true azimuth
Wind Direction Accuracy	Linearity tester	≤ ±5° per audit point
Wind Direction Linearity	Linearity tester	≤ 3° mean absolute average
Wind Dir Torque (Clim)	Torque watch	≤ 7.5 g-cm (0.104 oz-in)
Wind Dir Torque (RMY)	Vane torque gauge	≤ 11 g-cm (0.153 oz-in)
Relative Humidity	Collocated NIST RH sensor	≤ ±1.5 °C of dew point
Barometric Pressure	Collocated NIST BP sensor	≤ ±3 mbar
Solar Radiation[1]	Collocated NIST sensor	≤ ±5% of input+resolutuion[2]

1. Solar radiation not audited.
2. This audit limit is modified from PSD standard, as discussed below.

2.1.1 Data Acquisition System

An audit of the datalogger is conducted by comparing all datalogger outputs to the audit standards, as described below. The datalogger time is checked against an instantaneous time reading from the National Oceanic and Atmospheric Administration (NOAA) clock in Boulder, Colorado, via a global positioning system (GPS) handheld unit or telephone contact with the NOAA clock.

2.1.2 Air Temperature and Air Temperature Difference

The 2-meter and 10-meter thermistors are removed from their aspirator shields and collocated with a National Institute of Standards and Technology (NIST) traceable digital thermometer. The station thermistors and the transfer standard NIST thermometer are taped together and immersed in insulated thermoses containing a series of water baths; hot water (35°C to 45°C), warm water (15°C to 25°C), and a water/ice bath (0°C). Each water bath is agitated and allowed to equilibrate before simultaneous readings are taken from the three instruments. The difference between the individual station thermistors and the NIST standard are compared to the PSD temperature accuracy limit of ±0.5°C. The difference between the two station thermistors (10-m°C minus 2-m°C) is compared to the PSD temperature difference limit of ±0.1°C.

2.1.3 Wind Speed

Anemometers are audited to determine their accuracies in reading known wind speeds and to ascertain the sensor's threshold torque. The Climatronics and RM Young sensors are audited in very similar manners and are discussed together. The instruments are tested after removal from the tower and after removal of the sensor's props or cups.

First, an RM Young synchronous motor is attached to the shaft of the anemometer by using brand specific coupling devices. The sensor shaft is rotated at several different known revolutions per minute (rpm). Each rotational speed in rpm is equated to a wind speed in meters per second (m/s) by using the anemometer manufacturer's linear calibration formula. The difference between the calculated input speed in m/s and the datalogger output is compared to established PSD limits for each input rpm.

Next, a high precision torque watch is attached to the shaft of the anemometer, once again using custom couplings. Torque readings are made in both directions in each quadrant along the axis of rotation of the shaft. The maximum reading is recorded for the torque required to turn the shaft of the anemometer. The torque value recorded

during the audit is compared to manufacturer's torque corresponding to the minimum PSD threshold speed of 0.5m/s.

2.1.4 Wind Direction

The wind direction sensors are first audited as-found to determine the accuracy of their alignment with respect to true north (true azimuth alignment) using one of four methods. In one method, a handheld GPS unit is used to measure the position of the auditor with respect to a waypoint captured under the wind sensor's position on the tower. Using binoculars, the tail of the wind vane is aligned with the auditor's position at a distance of several hundred feet from the tower. The GPS bearing back to the tower waypoint is then compared to the DAS reading. The difference between the two should not exceed ±5° per audit point. This procedure is repeated at least 4 times, once per quadrant, generally near the cardinal directions. The second method uses a calibrated precision compass mounted on a gimbal and tripod. The compass declination is preset for the specific location and date using one of a variety of magnetic declination computer models. The sensor tail is aligned toward the auditor while auditor sights the compass toward the sensor and readings are taken in a similar manner to the GPS method.

Another option is to align the tail of the sensor with a distant identifiable landmark of know bearing. The bearing to the landmark may be ascertained using a variety of methods. One method involves physically capturing a distant GPS waypoint, such as at a discernable structure or emissions stack. Bearings to inaccessible natural landmarks, usually distant mountain peaks, are acquired through the use of various computer mapping programs, such as Natural Geographic's TOPO program or USGS digital raster graphics (DRGs) loaded into AutoCAD. The bearing from the station location to the landmark is compared to the DAS reading. This method yields the most accurate audit value, but is limited by weather and availability of discernable landmarks. The final method is to align the vane with the tower guy wires or preset survey markers, whose bearing has been ascertained using precision survey equipment.

The wind direction accuracy and linearity are subsequently audited after the wind direction sensor is removed from the tower. The Climatronics sensor is mounted on a Climatronics Model 101984 linearity tester and the RM Young sensor is mounted on an RM Young Model 18112 Vane Angle Bench Stand. Both test fixtures are keyed to their respective sensor and graduated from 0° to 360°. A series of readings starting at 30° and then clockwise in 30° increments are taken. The RM Young is read from 30° to 360° and the Climatronics is read from 30° to 540°. The Climatronics sensor is tested 180° past 360° in order to test the second potentiometer used in some DAS

programming. Although not required, the Climatronics sensor is also tested with the vane attached in order to ascertain sensor accuracy and linearity relative to the instrument crossarm. The vane is aligned along the axis of the crossarm to yield the 0°/360° and 180° values and against a square held to the crossarm for the 90° and 270° directions. Four readings are taken in a clockwise direction and four are taken counterclockwise to complete the test. For both the linearity test fixture and crossarm tests, individual error values are assessed for the PSD accuracy limit of ±5° per point and the mean absolute average error is assessed against the linearity limit of 3°.

Next, the RM Young wind direction threshold is tested by measuring wind vane torque using an RM Young Model 18331 Vane Torque Gauge. This device saddles the wind vane and a calibrated spring is pulled to determine maximum torque from readings taken in both directions in all four quadrants. The Climatronics wind direction starting torque is measured with the vane removed by using a precision torque watch in the same manner as the wind speed torque. The highest torque readings are compared to specific manufacturer limits for instrument staring torque.

Finally, the wind direction sensors are placed back on the tower and as-left audits of the azimuth alignments are conducted to ensure the instruments are properly reinstalled.

2.1.5 Relative Humidity

Relative humidity (RH) is audited using a collocated NIST traceable RH sensor. The NIST sensor and the field sensor are collocated out of direct sunlight to eliminate solar radiation effects, preferably inside of the motor aspirated shield. If the NIST standard reads directly in dew point °C, those readings are used; if not, relative humidity and temperature readings are used. For the audit, instantaneous readings of dew point, relative humidity and temperature are recorded from the transfer standard and the DAS. All relative humidity and temperature readings are converted to dew point in order to assess the PSD error limit of ±1.5°C dew point.

2.1.6 Barometric Pressure

Barometric pressure (BP) is audited using a collocated NIST traceable BP sensor. The difference between the NIST sensor and the station sensor are compared to the PSD limit of ±3 mbar.

2.1.7 Solar Radiation

Outputs of the station sensor are compared to the output of a level collocated audit solar radiation sensor. The audit sensor is connected to an independent audit datalogger with the scan interval and clock synchronized with the station DAS. Hourly

average solar radiation readings and instantaneous readings are recorded during the audit and then input into a custom spreadsheet to calculate a linear regression for the data. The PSD limit for solar radiation audits is ±5% of observed, but this standard is very difficult to obtain at the northern latitude of this installation. This EPA standard is currently undergoing review and is expected to change. A well excepted substitute is that individual DAS and audit data pairs are compared to a limit of ±5% of observed **+ EPA minimum instrument resolution (10W/m²)**. Individual data pairs are evaluated against this standard, but the overall set is restricted to a 5% error by limiting allowable linear slope to 1.0±0.05.

2.2 Performance Audit Results

The performance audit was conducted at the Pebble Port Station on January 16, 2006, with Dominic Shallies of HCG assisting. The wind sensors were also audited on February 10, 2006, after a severe storm.

On January 16, 2006 all sensors, except the solar radiation sensor, were challenged with certified audit equipment and yielded errors below the PSD limits. The solar radiation audit was not completed because adequate audit equipment was not available at the time of the audit. On February 10, 2006 the Climatronics sensor was found out of alignment due to a severe winter storm event which occurred on January 22, 2006. The operator compared Climatronics and RM Young alignment data prior to and after this storm event and corroborated this conclusion. The sensor was realigned and then re-audited. Table 2-2 contains summary data from the January 2006 audit and Table 2-3 summarizes the supplemental February 2006 tests. Complete audit reports and audit equipment calibration certificates are contained in Appendix A and Appendix B respectively.

2.3 Performance Audit Recommendations

- None.

Table 2-2 Port Station January 16, 2006 Performance Audit Summary

Parameter	Limit	Units	Max Err	Status
Datalogger Time	≤ ±5:00	Min:Sec	-0:20	Pass
2-m Temperature Accuracy	≤ ±0.5	°C	0.14	Pass

This Instrument was calibrated using Instruments Traceable to National Institute of Standards and Technology.

A Test Uncertainty Ratio of at least 4:1 is maintained unless otherwise stated and is calculated using the expanded measurement uncertainty. Uncertainty evaluation includes the instrument under test and is calculated in accordance with the ISO "Guide to the Expression of Uncertainty in Measurement" (GUM). The uncertainty represents an expanded uncertainty using a coverage factor k=2 to approximate a 95% confidence level. In tolerance conditions are based on test results falling within specified limits with no reduction by the uncertainty of the measurement. The results contained herein relate only to the item calibrated. This certificate shall not be reproduced except in full.

Wallace Berry

Wallace Berry, Technical Manager

Maintaining Accuracy:

In our opinion once calibrated your Digital Thermometer should maintain its accuracy. There is no exact way to determine how long calibration will be maintained. Digital Thermometers change little, if any at all, but can be affected by aging, temperature, shock, and contamination.

Recalibration:

For factory calibration and re-certification traceable to National Institute of Standards and Technology contact Control Company.

Certificate of Calibration

Report #: 101705-X0740015-RH **RMA #:** 95-49728 **Calibration Date:** Oct-17-2005
Model #: HMI41/HMP45 **Serial #:** X0650080 / X0740015
Instrument Type: Humidity Transmitter Calibration Procedure: 11603100
Instrument Range: 0 to 100%RH Recommended Calibration Due Date: Oct-17-2006

Customer: HOEFLER CONSULTING GROUP
City, State: ANCHORAGE, AK

This unit was calibrated by adjusting its reading at 0%* against a dry-air line and at 75% against reference humidity and temperature instrument, Vaisala model HMP233. Additional instrument verification checkpoints were made against HMP233 reference at 11%RH, 33%RH and 97%* RH. Calibration and instrument verification sequences utilize a dry-air line and a set of controlled aqueous salt solutions Vaisala model HMK13B. Laboratory ambient conditions are humidity and temperature controlled. The calibration uncertainty is presented at 95% confidence level, k=2. The standard uncertainty of the measurement has been determined in accordance with U.S. Guide to the Expression of Uncertainty in Measurement. *Note: the 0% and 97% RH points are not ISO17025 Accredited.

1.0 INTRODUCTION

Hoefler Consulting Group, Inc. (HCG) operates meteorological monitoring stations for Northern Dynasty Mines, Inc. (NDM) in support of the Pebble Mine Project near Iliamna, Alaska. The air monitoring program is one component of ongoing baseline environmental studies being conducted to support mine permitting, mine design and mine transportation infrastructure development. The stations meet Prevention of Significant Deterioration (PSD) guidelines, although PSD permits may not be required. This report covers the Port monitoring station located near the proposed mine port site.

The Pebble Port Station is located on the west shore of Iniskin Bay, near the southern end of the bay. The station is situated on a 50' high knoll, very near the water's edge. The Port Station consists of an instrumented 11-meter sectional tower secured with three guy wires. Approximately 20' south of the tower is a 6' by 8' insulated building which houses the datalogger and power supply system. The Pebble Port Station is instrumented with PSD quality sensors monitoring the following parameters:

- Ambient Temperature (ºC): Met One 062MP Thermistor Probe at 2-m
- Temperature Difference (ºC): Met One 062MP Thermistors at 2-m and 10-m
- Wind Speed 1 (m/s): Climatronics F460 P/N 100075 Wind Speed Sensor
- Wind Direction 1 (°): Climatronics F460 P/N 100076 Wind Direction Sensor
- Wind Speed 2 (m/s): RM Young 05305 Wind Monitor-AQ
- Wind Direction 2 (°): RM Young 05305 Wind Monitor-AQ
- Sigma Theta (°): Campbell Scientific CR10X DAS calculated (Yamartino)
- Relative Humidity (%RH): Vaisala HMP45AC Relative Humidity Sensor
- Barometric Pressure (mbar): Vaisala PT101B Barometric Pressure Sensor
- Solar Radiation (W/m2): LI-COR Li-200SX Solar Radiation Pyranometer.

This report has been prepared for NDM to serve as an official review of the Pebble Port Station and a review of the overall Pebble Project Meteorological Monitoring Program. To that end, Systems and Performance Audits were undertaken in order to help demonstrate that the equipment and procedures used for collecting meteorological data by HCG meet the requirements set forth by the U.S. Environmental Protection Agency (EPA) and the Alaska Department of Environmental Conservation (ADEC).

2.0 SYSTEMS AUDIT

2.1 Systems Audit Methodology

In the *Quality Assurance Handbook for Air Pollution Measurement Systems* and the *Meteorological Monitoring Guidance for Regulatory Modeling Applications*, EPA provides guidance for conducting systems audits. EPA recommends that a systems audit be conducted to serve as a qualitative review of all aspects of a meteorological monitoring program. The systems audit includes a review of the program plan, station site, facilities, equipment, personnel, procedures, record keeping, data validation and data reporting. The systems audit should be completed within the first 30 days of operation and every year thereafter.

The *Quality Assurance Project Plan for the Pebble Project Meteorological Monitoring Program* was completed by HCG in August 2006. This systems audit consisted of a review of this document, site visits and personnel interviews. Personnel were also observed during station maintenance and calibration operations. All aspects of the program not specifically mentioned in the Plan were reviewed to determine consistency with EPA and ADEC guidelines. The complete systems audit report contained in Appendix A is organized into six major sections; 1) General Program Information, 2) Monitoring Program Staff Organization, 3) Meteorological Monitoring Station Equipment, 4) Standard Operating Procedures, 5) Documentation, 6) Data Processing and Validation, 7) Quality Assurance and Quality Control (QA/QC), and 8) Comments and Suggestions. Each section consists of a question-answer format with additional comments to provide clarity. Flow charts are also used to accurately document program staff organization and the data handling process. A complete list of the references used for the systems audit is contained in Section 4.

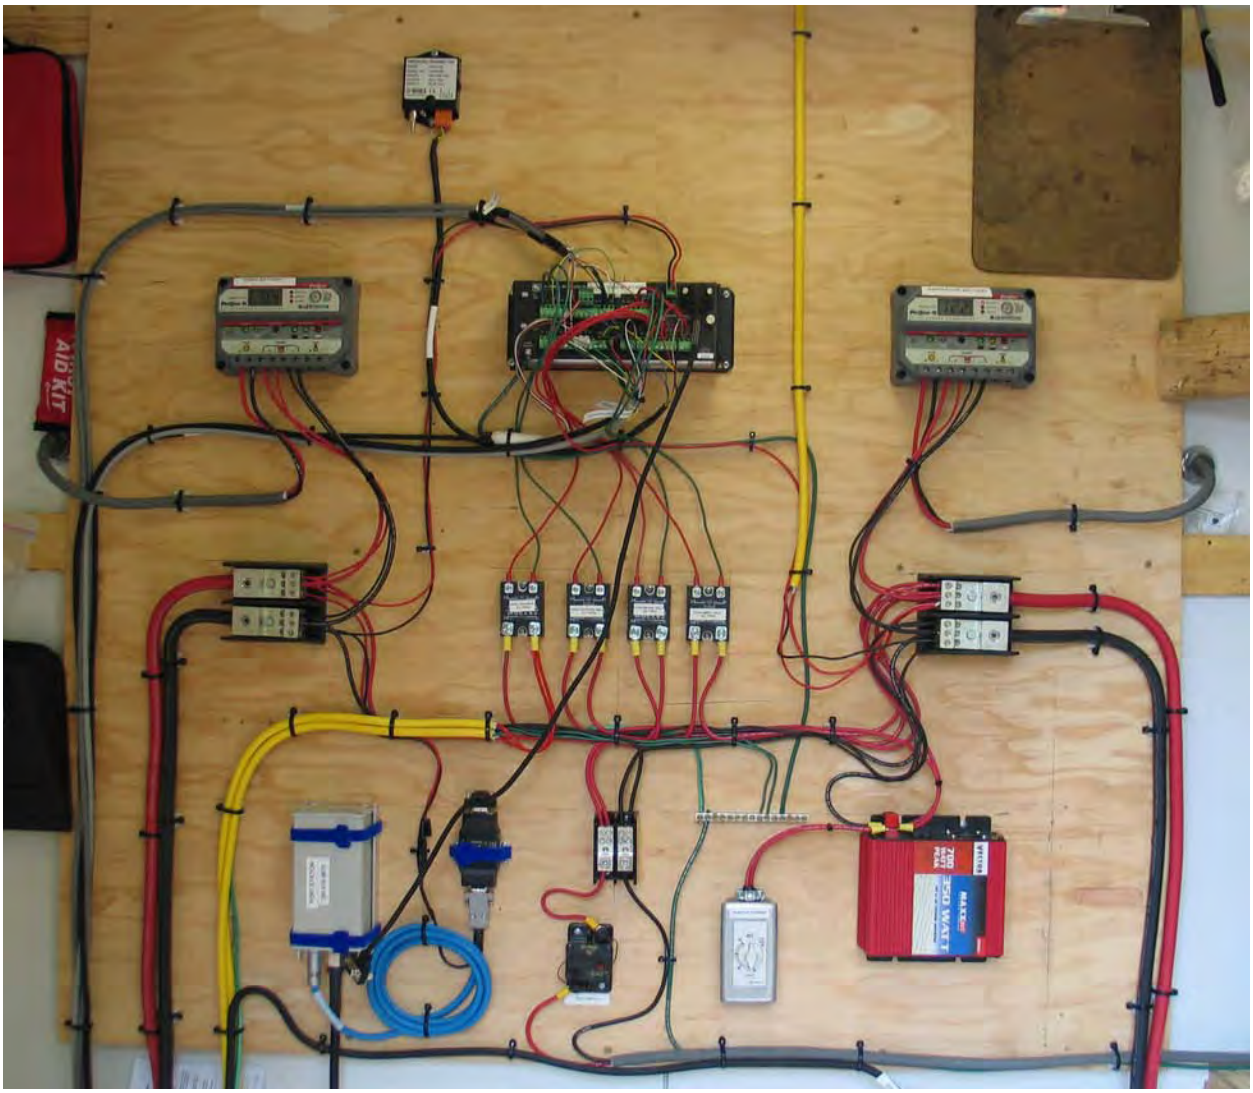
2.2 Meteorological Station On-Site Systems Audit

The on-site systems audit of the Pebble Port Station was conducted on August 21, 2006. Eric Brudie of HCG completed the systems audit with Dominic Shallies of HCG assisting and witnessing. Mr. Brudie serves as an independent auditor on this project and is not involved with day to day operations of the station.

The Pebble Port meteorological monitoring station is founded on a stable, well anchored tower with PSD quality sensors securely affixed. In order to protect instrumentation wires from animals; 2” liquid-tight conduit runs from the 12’ height on the tower to the prefab building. The data acquisition system (DAS), communications system, solar

controllers and power distribution system are mounted on a 4' by 4' plywood wiring panel mounted in the building, see photo.

Figure 2-1 Pebble Port Station DAS Wiring Panel



The Campbell Scientific CR10X DAS wiring is well organized and needs no further discussion. Constant communication between the DAS and a dedicated polling computer in the HCG office is integral to this installation. A Campbell Scientific SC932A interface converts the DAS signal to a RS-232 DCE modem signal. Three FreeWave spread spectrum radio modems transmit the signal to a SixNet industrial phone modem which is linked to the grid near Seldovia, Alaska. The met station radio and base radio rely on directional Yagi antennas focused on an omni-directional antenna at the repeater radio. The repeater radio is powered by one 35-Watt solar panel buffered through a solar controller and five 100 Amp-Hr deep cycle gel cell batteries.

Power generation at the meteorological monitoring station consists of four 50-Watt solar panels and a 21-Watt Global Thermoelectric Model 5030 Thermo-Electric Generator (TEG). One solar panel is dedicated to the DAS and meteorological instrumentation; wired through a Morningstar ProStar-15 solar controller and buffered through two 200 Amp-Hr deep cycle gel cell batteries. Three panels are dedicated to the aspirator fans, Climatronics heaters, shelter lighting and 120VAC power; wired through a Morningstar ProStar-15 solar controller and buffered through two 200 Amp-Hr deep cycle gel cell batteries. The shelter lights and 120VAC inverter for laptop use are routed through manual timers to ensure use only when operators are on site. During the winter months, November through April, the TEG is turned on to supplement the aspirator/heater power system. Aspirator fans and heaters are controlled through relays connected to the DAS control ports. Logic programmed into the DAS reduces power consumption by limiting heater use to weather conditions conducive to icing and turns fans off at night when voltage is low, considered an upset condition. Also the TEG power is routed through relays which shunt power to the critical DAS/sensor system during upset conditions.

2.3 Operations, Data Management and Documentation Systems Audit

This phase of the systems audit consists of a review of the HCG *Quality Assurance Project Plan for the Pebble Project Meteorological Monitoring Program* (Plan), and other system documentation, and a review of system operations. System operations include physically running the station and subsequent data management.

The Plan is a comprehensive document which adequately details the Pebble meteorological monitoring program. Program objectives, installations, operations, data management and quality assurance are all clearly outlined. Equally, the Pebble Port Station is representative of the Plan design. The Plan provides standard operating procedures and standard forms for all equipment field calibrations and audits. Station operators also had complete DAS and meteorological sensor manuals on hand at the station. Plan and documentation review are covered further in Appendix A.

Station operators were observed during calibration and maintenance procedures and appeared knowledgeable about all facets of operating the monitoring station. Data are downloaded daily using an automated script on a dedicated polling computer located at the HCG office. The raw data are appended to a station file located on the HCG server, which is backed up daily. The data manager copies the raw data to a custom Access/Excel database, leaving the raw data unaltered. The custom database creates a series of graphs of all meteorological data as well as some station operational parameters. These plots are reviewed 5-6 days per week in order to immediately

identify station upsets. An example is a graph of solar radiation and battery voltage; which reveals potential problems with daily charge cycles. Both the Climatronics and RM Young Wind sensor data are plotted together to indicate problems with one of the sensors. All station parameters are plotted with ranges and pairings intended to best reveal upset conditions. Problems are immediately identified and corrective action planned and executed. Steps are taken to flag data which may have been identified as suspect during this graphical data review. Data generated during station maintenance, audits and calibrations are also flagged as invalid.

Prior to compilation of data summary reports, data are screened using EPA recommended screening criteria. Data flagged as outliers by the screening program are further reviewed for consistency with prevailing conditions and then permanently invalidated or validated. Data ultimately invalidated are permanently removed from the database and the reasoning is codified in a special column in the database. This cleaned dataset is used for all subsequent data summaries, wind roses, data reports and capture rate calculations. More detailed discussion of the operations and data management are contained in the Systems Audit Appendix A.

2.4 Comments and Suggestions

The Pebble Port Station is a well designed and operated meteorological monitoring station. The remote station is equipped with a robust and sophisticated power supply. The systems audit revealed that HCG possesses the necessary organization, personnel, training, equipment, quality assurance, and quality control procedures to accurately collect and report PSD quality data. HCG adequately maintains the Pebble Port Station and practices sufficient data review and preventive maintenance to avoid unnecessary data loss.

The following recommendations are made to the program in order to improve the operation of the stations and ensure their operation is in accordance with standards:

- Create custom site visit checklists
- Keep a file on site containing copies of previous checklists.

3.0 PERFORMANCE AUDIT

3.1 Performance Audit Methodology

During the performance audit, the station datalogger is interfaced with a portable laptop computer to display the outputs for the meteorological sensors. The value of each meteorological sensor is compared to the output value from the appropriate piece of audit equipment or from calibrated instruments collocated with the sensor. The difference between the station's datalogger reading and the output from each audit instrument is compared with established PSD limits to determine the accuracy of each sensor. Additionally, threshold torques for wind speed and wind direction are measured with audit equipment and compared with manufacturer torques corresponding to the PSD threshold speed of 0.5 m/s. Table 3-1 provides a summary of the performance audit methods and limits used to audit each parameter at the stations.

Table 3-1 Performance Audit Methods and Acceptable Limits

Parameter	Audit Method	EPA/Manufacturer Limit
Datalogger Time	NOAA Clock	≤ ±5:00 minutes from AST
Temperature Accuracy	Collocated NIST thermistor	≤ ±0.5 °C
Temperature Difference	Collocated NIST thermistor	≤ ±0.1 °C
Wind Speed Accuracy	Synchronous rpm motor	≤ ±0.2 m/s + 5 % observed
Wind Spd Torque (Clim)	Torque watch	≤ 0.35 g-cm (0.0049 oz-in)
Wind Spd Torque (RMY)	Torque watch	≤ 1.0 g-cm (0.014 oz-in)
Wind Direction Alignment	GPS, compass or landmark	≤ ±5° from true azimuth
Wind Direction Accuracy	Linearity tester	≤ ±5° per audit point
Wind Direction Linearity	Linearity tester	≤ 3° mean absolute average
Wind Dir Torque (Clim)	Torque watch	≤ 7.5 g-cm (0.104 oz-in)
Wind Dir Torque (RMY)	Vane torque gauge	≤ 11 g-cm (0.153 oz-in)
Relative Humidity	Collocated NIST RH sensor	≤ ±1.5 °C of dew point
Barometric Pressure	Collocated NIST BP sensor	≤ ±3 mbar
Solar Radiation	Collocated NIST sensor	≤ ±5% of input+resolutuion[1]

1. This audit limit is modified from PSD standard, as discussed below.

3.1.1 Data Acquisition System

An audit of the datalogger is conducted by comparing all datalogger outputs to the audit standards, as described below. The datalogger time is checked against an instantaneous time reading from the National Oceanic and Atmospheric Administration (NOAA) clock in Boulder, Colorado, via a global positioning system (GPS) handheld unit or telephone contact with the NOAA clock.

3.1.2 Air Temperature and Air Temperature Difference

The 2-meter and 10-meter thermistors are removed from their aspirator shields and collocated with a National Institute of Standards and Technology (NIST) traceable digital thermometer. The station thermistors and the transfer standard NIST thermometer are taped together and immersed in insulated thermoses containing a series of fluid baths; hot water (35°C to 45°C), warm water (15°C to 25°C), water/ice bath (0°C), cold glycol (-15°C to -25°C) and very cold glycol (-35°C to -45°C). Dry ice is used to cool the glycol baths. Each liquid bath is agitated and allowed to equilibrate before simultaneous readings are taken from the three instruments.

An alternate method can also be used for the low temperature audits, employing a Thermal Mass Device (TMD). The TMD consists of a 6” diameter by 9” high solid aluminum block milled to fit snuggly inside of an insulated Dewar flask. On the top of the TMD, and in corresponding locations on the flask lid, are holes sized to accommodate a variety of Campbell, Climatronics, Met-One and VWR thermistors. The TMD is cooled to the target temperatures by contact with dry ice and then placed in the insulated flask. The audit and station thermistors are inserted through the flask lid and into the appropriate holes in the TMD. After the TMD and the thermistors are allowed to equilibrate, readings for all thermistors are simultaneously taken. The aluminum TMD has a very high thermal conductivity and when allowed to equilibrate inside of the insulated flask, thermal gradients across the TMD are very small.

In all cases, the difference between the individual station thermistors and the NIST standard are compared to the PSD temperature accuracy limit of ±0.5°C. The difference between the two station thermistors (10-m°C minus 2-m°C) is compared to the PSD temperature difference limit of ±0.1°C.

3.1.3 Wind Speed

Anemometers are audited to determine their accuracies in reading known wind speeds and to ascertain the sensor’s threshold torque. The Climatronics and RM Young sensors are audited in very similar manners and are discussed together. The

instruments are tested after removal from the tower and after removal of the sensor's props or cups.

First, an RM Young synchronous motor is attached to the shaft of the anemometer by using brand specific coupling devices. The sensor shaft is rotated at several different known revolutions per minute (rpm). Each rotational speed in rpm is equated to a wind speed in meters per second (m/s) by using the anemometer manufacturer's linear calibration formula. The difference between the calculated input speed in m/s and the datalogger output is compared to established PSD limits for each input rpm.

Next, a high precision torque watch is attached to the shaft of the anemometer, once again using custom couplings. Torque readings are made in both directions in each quadrant along the axis of rotation of the shaft. The maximum reading is recorded for the torque required to turn the shaft of the anemometer. The torque value recorded during the audit is compared to manufacturer's torque corresponding to the minimum PSD threshold speed of 0.5m/s.

3.1.4 Wind Direction

The wind direction sensors are first audited as-found to determine the accuracy of their alignment with respect to true north (true azimuth alignment) using one of four methods. In one method, a handheld GPS unit is used to measure the position of the auditor with respect to a waypoint captured under the wind sensor's position on the tower. Using binoculars, the tail of the wind vane is aligned with the auditor's position at a distance of several hundred feet from the tower. The GPS bearing back to the tower waypoint is then compared to the DAS reading. The difference between the two should not exceed ±5° per audit point. This procedure is repeated at least 4 times, once per quadrant, generally near the cardinal directions. The second method uses a calibrated precision compass mounted on a gimbal and tripod. The compass declination is preset for the specific location and date using one of a variety of magnetic declination computer models. The sensor tail is aligned toward the auditor while auditor sights the compass toward the sensor and readings are taken in a similar manner to the GPS method.

Another option is to align the tail of the sensor with a distant identifiable landmark of know bearing. The bearing to the landmark may be ascertained using a variety of methods. One method involves physically capturing a distant GPS waypoint, such as at a discernable structure or emissions stack. Bearings to inaccessible natural landmarks, usually distant mountain peaks, are acquired through the use of various computer mapping programs, such as Natural Geographic's TOPO program or USGS digital

raster graphics (DRGs) loaded into AutoCAD. The bearing from the station location to the landmark is compared to the DAS reading. This method yields the most accurate audit value, but is limited by weather and availability of discernable landmarks. The final method is to align the vane with the tower guy wires or preset survey markers, whose bearing has been ascertained using precision survey equipment.

The wind direction accuracy and linearity are subsequently audited after the wind direction sensor is removed from the tower. The Climatronics sensor is mounted on a Climatronics Model 101984 linearity tester and the RM Young sensor is mounted on an RM Young Model 18112 Vane Angle Bench Stand. Both test fixtures are keyed to their respective sensor and graduated from 0° to 360°. A series of readings starting at 30° and then clockwise in 30° increments are taken. The RM Young is read from 30° to 360° and the Climatronics is read from 30° to 540°. The Climatronics sensor is tested 180° past 360° in order to test the second potentiometer used in some DAS programming. Although not required, the Climatronics sensor is also tested with the vane attached in order to ascertain sensor accuracy and linearity relative to the instrument crossarm. The vane is aligned along the axis of the crossarm to yield the 0°/360° and 180° values and against a square held to the crossarm for the 90° and 270° directions. Four readings are taken in a clockwise direction and four are taken counterclockwise to complete the test. For both the linearity test fixture and crossarm tests, individual error values are assessed for the PSD accuracy limit of ±5° per point and the mean absolute average error is assessed against the linearity limit of 3°.

Next, the RM Young wind direction threshold is tested by measuring wind vane torque using an RM Young Model 18331 Vane Torque Gauge. This device saddles the wind vane and a calibrated spring is pulled to determine maximum torque from readings taken in both directions in all four quadrants. The Climatronics wind direction starting torque is measured with the vane removed by using a precision torque watch in the same manner as the wind speed torque. The highest torque readings are compared to specific manufacturer limits for instrument staring torque.

Finally, the wind direction sensors are placed back on the tower and as-left audits of the azimuth alignments are conducted to ensure the instruments are properly reinstalled.

3.1.5 Relative Humidity

Relative humidity (RH) is audited using a collocated NIST traceable RH sensor. The NIST sensor and the field sensor are collocated out of direct sunlight to eliminate solar radiation effects, preferably inside of the motor aspirated shield. If the NIST standard reads directly in dew point °C, those readings are used; if not, relative humidity and

temperature readings are used. For the audit, instantaneous readings of dew point, relative humidity and temperature are recorded from the transfer standard and the DAS. All relative humidity and temperature readings are converted to dew point in order to assess the PSD error limit of ±1.5°C dew point.

3.1.6 Barometric Pressure

Barometric pressure (BP) is audited using a collocated NIST traceable BP sensor. The difference between the NIST sensor and the station sensor are compared to the PSD limit of ±3 mbar.

3.1.7 Solar Radiation

Outputs of the station sensor are compared to the output of a level collocated audit solar radiation sensor. The audit sensor is connected to an independent audit datalogger with the scan interval and clock synchronized with the station DAS. Hourly average solar radiation readings and instantaneous readings are recorded during the audit and then input into a custom spreadsheet to calculate a linear regression for the data. The PSD limit for solar radiation audits is ±5% of observed, but this standard is very difficult to obtain at the northern latitude of this installation. This EPA standard is currently undergoing review and is expected to change. A well excepted substitute is that individual DAS and audit data pairs are compared to a limit of ±5% of observed **+ EPA minimum instrument resolution (10W/m²)**. Individual data pairs are evaluated against this standard, but the overall set is restricted to a 5% error by limiting allowable linear slope to 1.0±0.05.

3.2 Performance Audit Results

The performance audit was conducted at the Pebble Port Station on August 21, 2006 with Dominic Shallies of HCG assisting. All sensors were challenged with certified audit equipment and yielded errors below the PSD limits. The thermistor aspirator fans had failed and were replaced during the audit. Summary audit results are contained in Table 3-2 and complete audit reports and audit equipment calibration certificates are contained in Appendix B and Appendix C respectively.

3.3 Performance Audit Recommendations

- Set up DAS to read aspirator fan amperage in order to monitor fan status.

Table 3-2 Port Station August 21, 2006 Performance Audit Summary

Parameter	Limit	Units	Max Err	Status
Datalogger Time	≤ ±5:00	Min:Sec	0:07	Pass
2-m Temperature Accuracy	≤ ±0.5	°C	0.21	Pass
10-m Temperature Accuracy	≤ ±0.5	°C	0.21	Pass
Air Temperature Difference	≤ ±0.1	°C	0.00	Pass
Climatronics Wind System				
Wind Speed Torque	≤ 0.0049	oz-in	<<0.003	Pass
Low Wind Spd. Accuracy (≤5m/s)	≤ ±0.2	m/s	0.00	Pass
High Wind Spd. Accuracy (>5m/s)	≤ ±5	% input	0.0	Pass
Wind Direction Torque (old bearings)	≤ 0.104	oz-in	0.100	Pass
Wind Direction Torque (new bearings)	≤ 0.104	oz-in	0.070	Pass
Wind Dir. Azim. Align. (as-found)	≤ ±5	Degree	-0.6	Pass
Wind Direction Accuracy	≤ ±5	Degree	-1.3	Pass
Wind Direction Linearity	≤ 3	Degree	0.5	Pass
Wind Dir. Azim. Align. (as-left)	≤ ±5	Degree	-2.8	Pass
RM Young Wind System				
Wind Speed Torque[1]	≤ 0.014	oz-in	0.008	Pass
Low Wind Spd. Accuracy (≤5m/s)	≤ ±0.2	m/s	0.00	Pass
High Wind Spd. Accuracy (>5m/s)	≤ ±5	% input	0.0	Pass
Wind Direction Torque (old bearings)	≤ 11	g-cm	9.0	Pass
Wind Direction Torque (new bearings)	≤ 11	g-cm	6.0	Pass
Wind Dir. Azim. Align. (as-found)	≤ ±5	Degree	2.5	Pass
Wind Direction Accuracy	≤ ±5	Degree	-4.5	Pass
Wind Direction Linearity	≤ 3	Degree	2.6	Pass
Wind Dir. Azim. Align. (as-left)	≤ ±5	Degree	2.8	Pass
Relative Humidity (dew point)	≤ ±1.5	°C	0.7	Pass
Barometric Pressure	≤ ±3	Mbar	1.0	Pass
Solar Radiation	≤ ±5+Res	% input	-5.8	Pass

1. Could not replace RM Young speed bearing due to stripped set screw.

1.0 GENERAL PROGRAM INFORMATION

1.1 Site Description

The Pebble Port tower is located near the middle of a small point on the west shore of Iniskin Bay. The 50' high point is approximately 75' wide and 150' long and is vegetated with Alders, low shrubs and small Spruce trees. East of the station are the waters of Iniskin Bay and to the west the topography rises steeply to almost 3,000'.

1.2 Site Location

1.2.1 Coordinates

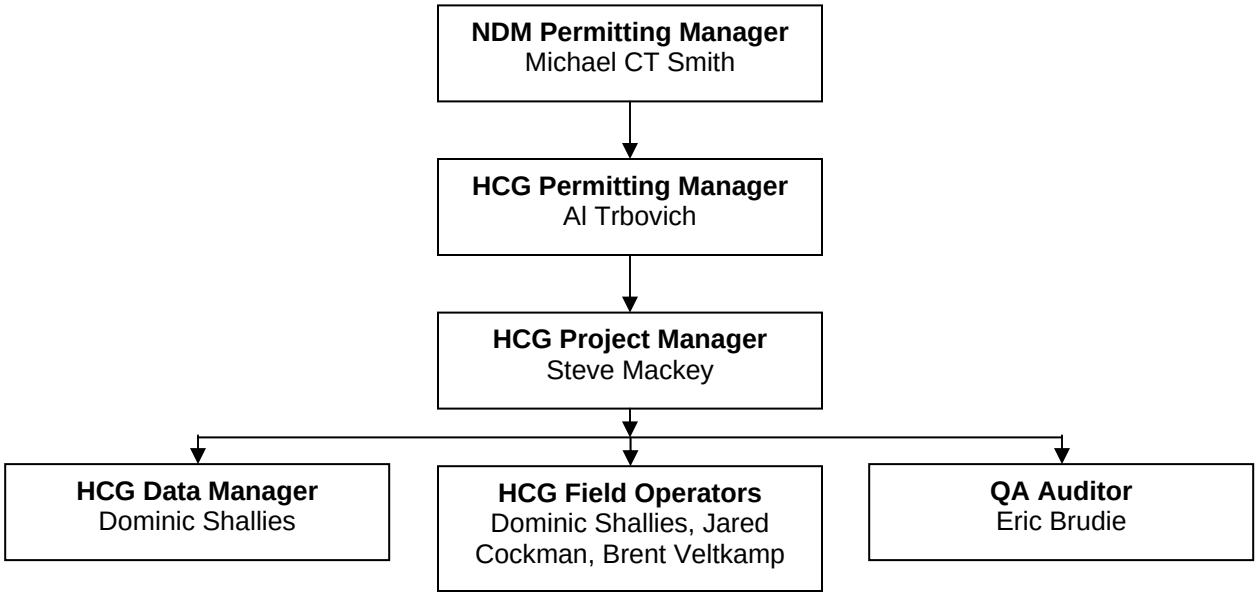
Indicated by Operator	Determined by Auditor
59° 39' N	59° 38.959' N
153° 28' W	153° 28.314' W
Elevation: 40 feet	Elevation: 50 feet

1.2.2 Appearance and Safety

Does the site appear clean, organized and well maintained?	■ Yes □ No	Comments: None.
Does the site appear to be safe and reasonably hazard free?	■ Yes □ No	Comments: None.
Does the site have a shelter for operators?	■ Yes □ No	Comments: None.
Does the site have emergency equipment such as a first aid kit available?	■ Yes □ No	Comments: None.
Does the site have adequate measures to prevent human tampering?	■ Yes □ No	Comments: 6' fence surrounds station.
Does the site have adequate measures to prevent damage from animals?	■ Yes □ No	Comments: Cables protected in liquid-tight conduit and electronics inside shelter.

2.0 MONITORING PROGRAM STAFF ORGANIZATION

- Draw diagram indicating the organizational structure of the monitoring program. Include names and titles:



3.0 METEOROLOGICAL MONITORING STATION EQUIPMENT

3.1 Inventory

Parameter	Make	Model	Serial No.
DAS	Campbell Scientific	CR10X	X41611
DAS Wiring Panel	Campbell Scientific	CR10X	31375
Temperature (2-meter)	Met One	062MP	E3381, ID #1/2
Temperature (10-meter)	Met One	062MP	E3381, ID #2/2
Temperature Aspirators	Met One	076B-4	Unknown
Primary Wind Speed	Climatronics	F460-100075	5008
Primary Wind Speed Cups	Climatronics	HD Al. P/N 101287	2285
Primary Wind Direction	Climatronics	F460-100076	4690
Primary Wind Direction Vane	Climatronics	HD P/N 101288	1425
Wind Sigma	Campbell Scientific	DAS Calculated	N/A

3.2 Equipment Evaluation

3.2.1 Data Acquisition System (DAS) and Communications System

Is the DAS well protected from the elements with adequate room for maintenance?	■ Yes □ No	Comments: DAS inside of a weatherproof building, mounted on a 4'x4' wiring panel.
Is the DAS rated for operation in the expected local temperature range?	■ Yes □ No	Comments: -55°C to + 85°C.
Are all sensor cables neatly and securely connected to the correct DAS channels?	■ Yes □ No	Comments: Well organized wiring panel.
Is remote communication to the DAS system available to operators?	■ Yes □ No	Comments: DAS to SC932A interface to FreeWave RF network to SixNet modem.
Are all components of the DAS and communications system operational?	■ Yes □ No	Comments: None.
Are the DAS and communication equipment properly grounded?	■ Yes □ No	Comments: 8' ground rod wired to central ground buss.
Are the DAS and communication equipment protected from lightning?	□ Yes ■ No	Comments: There is no lighting protection, but area not prone to strikes.

3.2.2 Power Supply System

Does the system have a stable power supply or line power?	■ Yes □ No	Comments: Very robust alternative power supply described below.

- Describe the meteorological monitoring station power supply system.

The DAS, communications equipment and meteorological sensors are powered by one 50-Watt solar panel, buffered through two 200 amp-hr deep cycle gel cell batteries. The aspirator fans and Climatronics wind sensor heaters are powered by three 50-Watt solar panels buffered through two 200 amp-hr deep cycle gel cell batteries. During the winter months (November through April), the aspirator/heater system is also powered by a 21-Watt propane Thermo-Electric Generator (TEG). The isolated DAS and Aspirator power systems can be interconnected during upset conditions through an array of relays managed through the DAS control ports. The DAS monitors battery levels and can shunt the two power systems should one run low. The DAS also has algorithms programmed to assess weather conditions and limit heater use when not required.

3.2.3 Meteorological Monitoring Sensors

Do all sensors appear to be clean, intact, in good condition and well maintained?	■ Yes □ No	Comments: None.
Are all sensors operational, online and reporting data?	■ Yes □ No	Comments: None.
Do all sensors meet EPA criteria for PSD quality sensors?	■ Yes □ No	Comments: See table below.
Are spare parts stocked for items which are frequently worn out or broken?	■ Yes □ No	Comments: Spare props, cups and vanes onsite and spare bearings at HCG office.

3.2.4 EPA PSD Meteorological Instrument Standards

Parameter	Instrument Specifications	EPA Standard	Pass?
Air Temperature (2-M, 10-M & Delta-T) – Met One Mdl. 062MP			
Accuracy (2-m & 10-m):	±0.05 °C	±0.5 °C	Yes
Accuracy (Delta-T):	±0.02 °C	±0.1 °C	Yes
Range (Operating Temp):	-50°C to +50°C	-20°C to +30°C	Yes
*Resol. (2-m & 10-m):	0.01°C	0.1°C	Yes
*Resolution (Delta-T):	0.01°C	0.02°C	Yes
Response Time:	10 seconds	≤1 minute	Yes
Wind Speed – Climatronics Mdl. F460-100075			
Accuracy:	±0.07 m/s or ±1% of obs.	±0.2 m/s + 5% of observed	Yes
Range:	0.0 m/s to 65 m/s	0.5 m/s to 50 m/s	Yes
*Resolution:	0.01m/s	0.1 m/s	Yes
Threshold Speed:	0.22 m/s	≤0.5 m/s	Yes
Distance Constant:	<4.0 m (HD Alum. Cups)	≤5 m	Yes

Range:	0 W/m^2 to 3000 W/m^2	Not Specified	N/A
*Resolution:	1 W/m^2	10 W/m^2	Yes
Response Time:	10 µs	5 seconds	Yes
Spectral Response:	400 nm to 1,100 nm	285 nm to 2800 nm	No
Operating Temperatures:	-40°C to +65°C	-20°C to +40°C	Yes
* For all instruments; resolutions are the result of instrument type, configuration and DAS programming.			

3.3 Station Location and Siting

3.3.1 Tower

Do all obstructions exist below a 1:10 slope away from the tower base? ■ Yes □ No Comments: None.

Is the height of the tower 10 meters above the ground? ■ Yes □ No Comments: None.

Is the tower stable and plumb? ■ Yes □ No Comments: None.

Is the tower protected from lightning? □ Yes ■ No Comments: There is no lighting protection, but area not prone to strikes.

3.3.2 Temperature and Relative Humidity Sensors

Are the sensors mounted at least 2-m above open level ground at least 9-m in diameter? ■ Yes □ No Comments: None.

Are the temperature difference probes at heights of 2-m and 10-m above the ground? ■ Yes □ No Comments: None.

Are the sensors at a distance greater than four times the height of any obstruction? ■ Yes □ No Comments: None.

Is the ground beneath the temperature sensors natural native material? ■ Yes □ No Comments: None.

Is the site free of any natural features that could bias temperature data (e.g. open water, sloping ridge, etc.)? ■ Yes □ No Comments: None.

Is the site free of any man-made features that could bias temperature data (e.g. asphalt, concrete, exhaust plumes, etc.)? ■ Yes □ No Comments: None.

Are the sensors located at least 30 meters from large paved areas? ■ Yes □ No Comments: None.

Is the ambient temperature sensor protected from the influence of solar radiation? ■ Yes □ No Comments: Housed in Met One Mdl 076B-4 Motor Aspirated Radiation Shield.

Are the temperature difference sensors located in identical aspirated shields? ■ Yes □ No Comments: Housed in Met One Mdl 076B-4 Motor Aspirated Radiation Shields.

3.3.3 Wind Speed and Wind Direction Sensors

Is the horizontal distance between the instruments and any obstruction at least 10 times the height of the obstruction?	■ Yes □ No	Comments: None.
Are the instruments at least 1.5 times nearby building height(s) above the building roof(s), or 10-m high?	■ Yes □ No	Comments: None.
Are the wind speed and wind direction sensors stable and plumb?	■ Yes □ No	Comments: None.
Is the distance of the sensor on the cross-arm at least twice the diameter of the tower?	■ Yes □ No	Comments: Climatronics Sensors mounted on a crossarm which meets this criterion.
Is the distance of the sensor on the cross-arm at least twice the diameter of the tower?	■ Yes □ No	Comments: RM Young sensor mounted on an extension arm which meets this criterion.
Is the wind direction sigma theta data being collected according to EPA requirements?	■ Yes □ No	Comments: DAS calculated using Yamartino method and a one-second scan interval.

3.3.4 Relative Humidity and Barometric Pressure

Is the relative humidity sensor open to the atmosphere & protected from precipitation?	■ Yes □ No	Comments: Housed in 2-m aspirated shield with temperature sensor.
Is the barometric pressure sensor open to atmosphere & protected from precipitation?	■ Yes □ No	Comments: Housed in unsealed shelter, mounted on wiring panel.

3.3.5 Solar Radiation

Is the instrument situated above the plane of any obstructions that could cast shadows?	■ Yes □ No	Comments: None.
Is the sensor situated south of the tower to minimize obstruction from the tower?	■ Yes □ No	Comments: None.

4.0 STANDARD OPERATING PROCEDURES

4.1 General

Is the station visited on a preset schedule?	■ Yes □ No	Comments: None.
Have standard SOPs been developed, and are they being followed by the operators?	■ Yes □ No	Comments: None.
Does the operator follow a preventative maintenance schedule?	■ Yes □ No	Comments: None.
Are site visits and maintenance activities properly documented in a Station Log?	■ Yes □ No	Comments: Site visit memos are compiled.
Are station operators knowledgeable and competent regarding effective operation?	■ Yes □ No	Comments: None.
Have operators attended any formal training for operating met monitoring stations?	□ Yes ■ No	Comments: All operators have one to two years onsite experience.

Are copies of the NIST certifications for the calibration equipment made available?	■ Yes □ No	Comments: Attached.

4.2 DAS and Meteorological Sensors

Are regular multipoint QC checks performed on the DAS?	■ Yes □ No	Comments: DAS audited by virtue of the instrument output values.
Are regular multipoint QC checks performed on the meteorological sensors?	■ Yes □ No	Comments: None.
Are the sensors visually inspected for defects and problems?	■ Yes □ No	Comments: None.
Are ambient conditions compared with sensor readings from the DAS?	■ Yes □ No	Comments: DAS output compared to Iliamna Airport weather station.
Are data frequently reviewed for reasonableness and completeness?	■ Yes □ No	Comments: None.
Is a copy of the datalogger program made available for review?	■ Yes □ No	Comments: None.

5.0 DOCUMENTATION

5.1 System Reference and Maintenance Manuals

Does the operator have all required DAS and meteorological instrument manuals?	■ Yes □ No	Comments: On-site and at HCG offices.
Does the operator have configuration and wiring schematics specific to the station?	■ Yes □ No	Comments: Operator carries wiring schematics.

5.2 Station Monitoring Plan and Report Forms

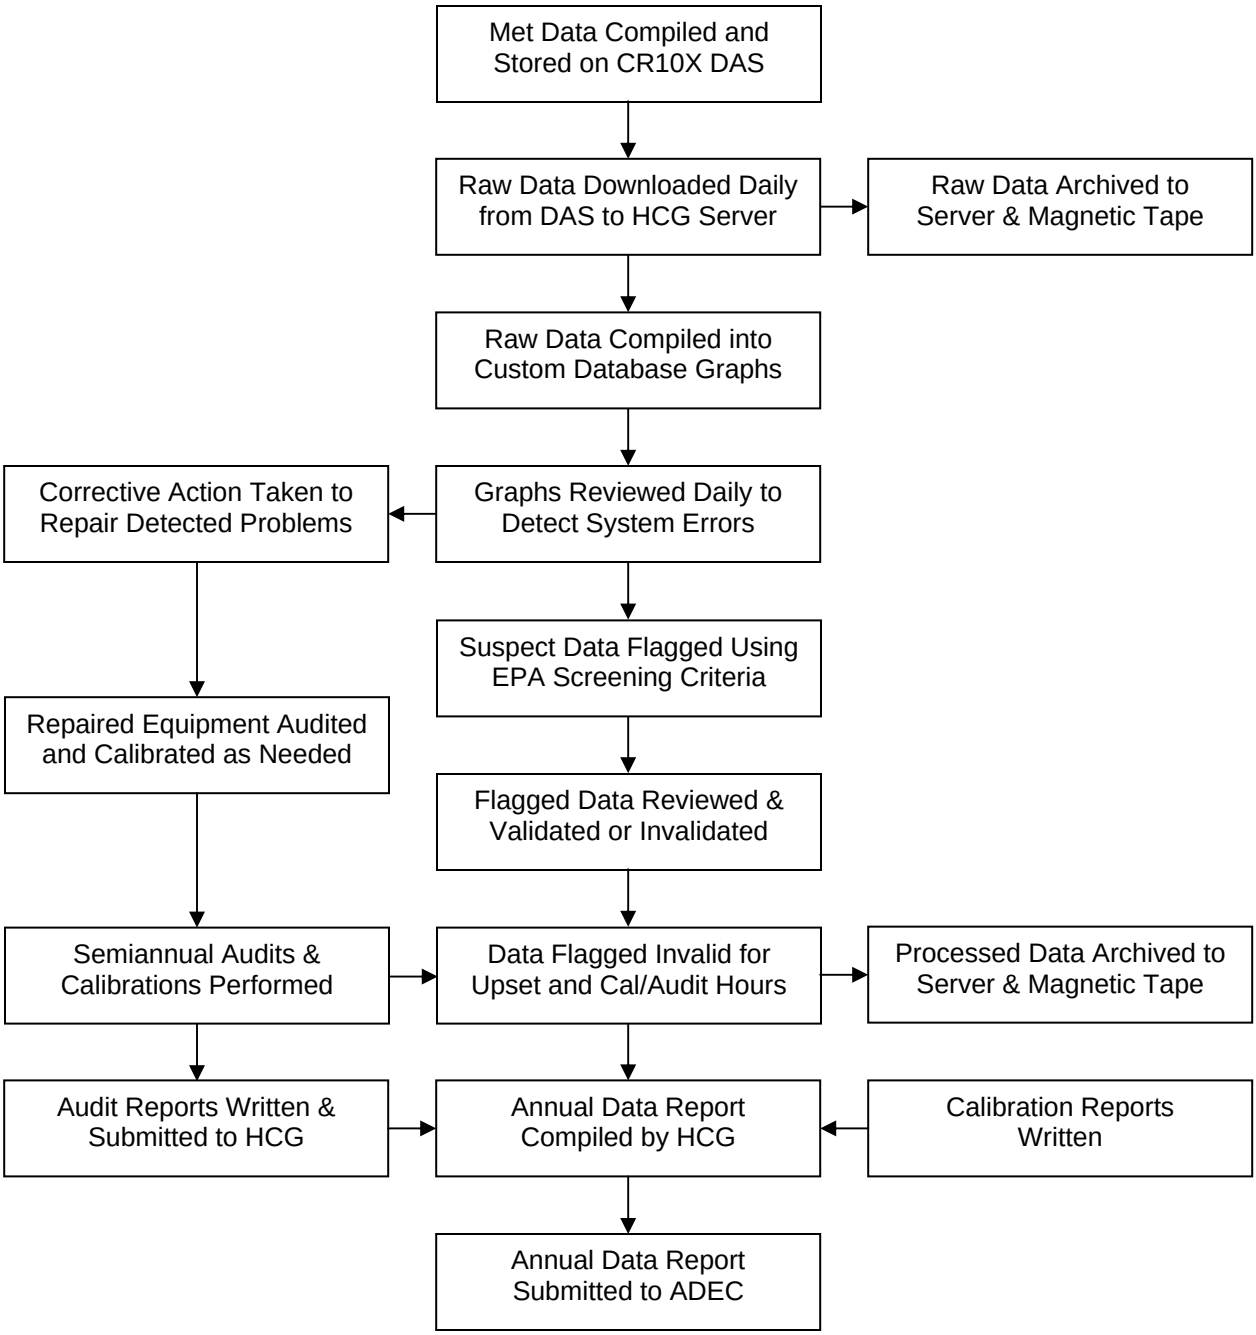
Is the Monitoring/QA plan comprehensive and reflective of the actual installation?	■ Yes □ No	Comments: None.
Does the Monitoring/QA plan indicate the intended use for the data collected during the monitoring program?	■ Yes □ No	Comments: Collect PSD quality data to meet dispersion modeling requirements and satisfy mine/transportation design requirements.
Does the system outlined in the QA plan meet the objectives outlined above?	■ Yes □ No	Comments: PSD quality installation.
Does the QA Plan indicate the intended schedule for reports to be submitted?	■ Yes □ No	Comments: None.
Does the station have an activity log?	□ Yes ■ No	Comments: Site visit memos written after each visit to supplant a log book.
Does the station have a formal Site Visit and Checklist Form?	□ Yes ■ No	Comments: No formal checklist used.
Does the station have an adequate Operations Manual?	■ Yes □ No	Comments: Monitoring/QA plan and equipment manuals.

Does the station have an adequate Calibration Report Form and copies of previous calibrations and audits?	■ Yes □ No	Comments: None.
Are report forms and site logs properly completed and current?	■ Yes □ No	Comments: None.

6.0 DATA PROCESSING and VALIDATAION

6.1 Overall Data Management

- Diagram the flow of data from monitoring equipment to submission of a final report.



6.2 Data Collection and Initial Data Review

Is the station polled and data downloaded on a regular basis?	■ Yes □ No	Comments: Daily via RF modem and telephony modem.
Are the monitoring station data reviewed on a regular basis?	■ Yes □ No	Comments: Data imported into custom graphs and reviewed 5-6 days per week.
Are the monitoring station data screened on a regular basis?	■ Yes □ No	Comments: Data screened using EPA criteria prior to summary compilations.
Are procedures in place for backing up raw data?	■ Yes □ No	Comments: Raw data files are backed up on the HCG server and on magnetic tape.
Are written procedures for data handling available for the project?	■ Yes □ No	Comments: None.

- Describe the data polling process and initial data evaluation.

Data is downloaded from the station on a daily basis using a dedicated data polling computer located at the HCG office. The raw *.dat file is appended to the existing raw station data file located on the HCG server, which is backed up to tape daily. The raw data are copied to an Access/Excel database file which generates custom graphs of the various meteorological and operational parameters. These graphs are reviewed 5-6 days per week in order to identify station problems. This graphical data review is the frontline of maintaining a complete and defensible dataset. Station upsets are instantly identified and repaired within days. Copies of both the raw unadjusted data and the custom database files are retained for a minimum of 5 years.

6.3 Corrective Actions

Are procedures established for initiating corrective actions during data processing?	■ Yes □ No	Comments: Daily graphical data review and subsequent reactions.

- Describe procedures for initiating, tracking and closing corrective actions.

When nonconformance issues are recognized during graphical review, the Lead Operator/Data Manager plans and executes corrective action. A calibration check is performed on any sensor which is repaired or replaced during the action. A site visit memo outlining the nature of the problem and repairs undertaken is written and saved to the station file. Any quantifiable error is also documented for possible data validation. The Operator/Data Manager ensures the erroneous data are flagged for the period from initial noncompliance until repair and calibration.

6.4 Data Validation

Are data validation procedures established and in use?	■ Yes □ No	Comments: None.
Are adjusted and unadjusted data sets maintained?	■ Yes □ No	Comments: Both are backed up on the HCG server and magnetic tape.

- Describe the initial data validation procedure.

Data is compiled in a custom Excel spreadsheet programmed to evaluate meteorological data against EPA recommended PSD data screening criteria. The data are screened for events such as; extended periods of zero wind speed (indicating icing or worn bearings), temperatures outside of the known monthly max/min for the area, etc. Nonconforming data are flagged by the screening program for further investigation. Also, data periods for individual parameters are flagged for times when the corresponding instrument was undergoing field servicing, calibrations or audits. Periods when instruments are known to have been out of calibration or malfunctioning are also flagged.

- Describe procedures for validating and invalidating flagged data (outliers).

Data flagged during the screening process described above are manually reviewed. If the data have a quantifiable, consistent and documented bias, they may be adjusted and then validated. Specific guidelines are detailed in the Plan. Data which have been flagged by the screening program are also compared to local weather conditions as determined from other sources. Examples where data flagged during screening may be validated include periods when winds were known to have been exceptionally calm at nearby stations or extreme temperatures outside the historical max/min were witnessed. At this point, flagged data are permanently validated and left in the database or invalidated and removed from the database. Data removed from the database are replaced with an alphanumeric code to indicate the reason for invalidation.

- Identify those responsible for data validation.

Name: Dominic Shallies
Position: Lead Operator & Data Manager
Affiliation: Hoefler Consulting Group, Inc.

Name: Isaac Bertschi
Position: Data Management
Affiliation: Hoefler Consulting Group, Inc.

6.5 Data Capture

- Identify the desired data capture rate for the monitoring data.

Target rate for PSD Quality Meteorological Monitoring Data is 90%.

Is the desired data capture rate being met for each data type?	■ Yes □ No	Comments: None.

6.6 Data Reporting

Are quarterly and annual data reports being submitted for the site?	■ Yes □ No	Comments: None
Are qualified staff personnel reviewing data reports prior to submittal?	■ Yes □ No	Comments: None.
Is finalized data set submitted with report to ADEC?	■ Yes □ No	Comments: None.

7.0 QUALITY ASSURANCE AND QUALITY CONTROL

7.1 Quality Assurance Program

Has a quality assurance plan been written describing quality assurance procedures?	■ Yes □ No	Comments: None.
Is a copy of the plan available to field and data processing personnel?	■ Yes □ No	Comments: None.
Has the quality assurance plan been approved by the ADEC?	■ Yes □ No	Comments: None.

- Identify those person(s) responsible for updating the plan SOPs.

Name: Steve Mackey
Position: Project Manager
Affiliation: Hoefler Consulting Group, Inc.

7.2 Quality Assurance Methods and Audits

Have adequate audit procedures been identified within the quality assurance plan?	■ Yes □ No	Comments: None.
Does the Plan correctly document PSD accuracy limits for calibrating and auditing?	■ Yes □ No	Comments: None.
Have audits been conducted on the suggested schedule of every six months?	■ Yes □ No	Comments: None.

- Identify the person(s) responsible for conducting audits on the monitoring instrumentation.

Name: Eric Brudie
Position: Field Auditor
Affiliation: Hoefler Consulting Group, Inc.

8.0 COMMENTS AND SUGGESTIONS

- Prepare and compile site specific station checklists and visit forms.

APPENDIX B
PERFORMANCE AUDIT DATA SHEETS and ALIGNMENT MAP

METEOROLOGICAL STATION - INSTRUMENT PERFORMANCE AUDIT (11-M)

Owner: Northern Dynasty **Operator:** Dominic Shallies **Alternate:** Steve Mackey **Station Site:** Port
Auditor: Eric Brudie **Witness(s):** Dominic Shallies **Audit Date:** 21-Aug-06

● *DAS TIME AUDIT*

PSD Limits: DAS time = Alaska Standard Time (AST) +/- 5 minutes.
Conversions: Winter; (AST) = (DST), Summer; (AST) = (DST) - 1 hr.
Comments: None.

DAS TIME vs. NOAA CLOCK			
AST Time	DAS Time	Error Min:Sec	Pass/ Fail?
16:54:30	16:54:37	**00:07**	**PASS**

● *TEMPERATURE SENSORS & ΔT AUDIT*

Lower Height: 2.0 **Meters** **Upper Height:** 10.0 **Meters**

This Instrument was calibrated using Instruments Traceable to National Institute of Standards and Technology.

A Test Uncertainty Ratio of at least 4:1 is maintained unless otherwise stated and is calculated using the expanded measurement uncertainty. Uncertainty evaluation includes the instrument under test and is calculated in accordance with the ISO "Guide to the Expression of Uncertainty in Measurement" (GUM). The uncertainty represents an expanded uncertainty using a coverage factor k=2 to approximate a 95% confidence level. In tolerance conditions are based on test results falling within specified limits with no reduction by the uncertainty of the measurement. The results contained herein relate only to the item calibrated. This certificate shall not be reproduced except in full, without written approval of Control Company.

Nominal=Standard's Reading; As Left=Instrument's Reading; In Tol=In Tolerance; Min/Max=Acceptance Range; ±uc=Measurement Uncertainty; TUR=Test Uncertainty Ratio; Accuracy=±(Max-Min)/2

Wallace Berry

Wallace Berry, Technical Manager

Maintaining Accuracy:

In our opinion once calibrated your Digital Thermometer should maintain its accuracy. There is no exact way to determine how long calibration will be maintained. Digital Thermometers change little, if any at all, but can be affected by aging, temperature, shock, and contamination.

Recalibration:

For factory calibration and re-certification traceable to National Institute of Standards and Technology contact Control Company.

Certificate of Calibration

Report #: 101705-X0740015-RH **RMA #:** 95-49728 **Calibration Date:** Oct-17-2005
Model #: HMI41/HMP45 **Serial #:** X0650080 / X0740015
Instrument Type: Humidity Transmitter Calibration Procedure: 11603100
Instrument Range: 0 to 100%RH Recommended Calibration Due Date: Oct-17-2006

Customer: HOEFLER CONSULTING GROUP
City, State: ANCHORAGE, AK

This unit was calibrated by adjusting its reading at 0%* against a dry-air line and at 75% against reference humidity and temperature instrument, Vaisala model HMP233. Additional instrument verification checkpoints were made against HMP233 reference at 11%RH, 33%RH and 97%* RH. Calibration and instrument verification sequences utilize a dry-air line and a set of controlled aqueous salt solutions Vaisala model HMK13B. Laboratory ambient conditions are humidity and temperature controlled. The calibration uncertainty is presented at 95% confidence level, k=2. The standard uncertainty of the measurement has been determined in accordance with U.S. Guide to the Expression of Uncertainty in Measurement. *Note: the 0% and 97% RH points are not ISO17025 Accredited.

STANDARDIZATION OF EPPLEY PRECISION SPECTRAL PYRANOMETER Model PSP

Serial Number: 34377F3

Resistance: 603 Ω at 23 °C
Temperature Compensation Range: -20 to 40 °C

This radiometer has been compared with Standard Precision Spectral Pyranometer, Serial Number 21231F3 in Eppley's Integrating Hemisphere under radiation intensities of approximately 700 watts meter^{-2} (roughly one-half a solar constant). The adopted calibration temperature is 25 °C.

As a result of a series of comparisons, it has been found to have a sensitivity of:

$$9.33 \times 10^{-6} \text{ volts/watts meter}^{-2}$$

The calculation of this constant is based on the fact that the relationship between radiation intensity and emf is rectilinear to intensities of 1400 watts meter^{-2}. This radiometer is linear to within ± 0.5% up to this intensity.

The calibration of this instrument is traceable to standard self-calibrating cavity pyrheliometers in terms of the Systems Internationale des Unites (SI units), which participated in the Ninth International Pyrheliometric Comparisons (IPC IX) at Davos, Switzerland in September-October 2000.

Useful conversion facts: 1 cal cm^{-2} min^{-1} = 697.3 watts meter^{-2}
1 BTU/ft^2-hr^{-1} = 3.153 watts meter^{-2}.

Executive Summary

On behalf of The Pebble Limited Partnership, care of Pebble Mines Corp., its general partner, HCG Inc, dba. Hoefler Consulting Group is collecting meteorological data to support baseline environmental studies, mine design objectives, and air quality permitting needs for the Pebble Project.

Prevention of Significant Deterioration (PSD) quality meteorological monitoring for the Pebble Project began on August 1, 2005 and will be ongoing. This report provides details of the 2006 calendar year of meteorological measurements collected from January 1, 2006 through December 31, 2006 at the proposed port location.

Table E-1 and E-2 provide monthly and annual valid data capture hours and the percent data capture, respectively, for the Pebble Port meteorological monitoring station. The Pebble Port meteorological monitoring station met all PSD requirements during the monitoring year with the exception of the secondary wind speed sensor, which did not meet the minimum PSD monitoring requirement of 90% data capture or better as a result of sensor failure during Monitoring Quarter C (July 1, 2006 through September 30, 2006) and Quarter D (October 1, 2006 through December 31, 2006). However, the collocated primary PSD-quality wind speed sensor (Climatronics, model F460 (P/N 100075)) had greater than 90% data capture during this same period. Therefore, measurements from the primary PSD-quality instrument will be used to fulfill PSD data capture requirements for Monitoring Quarters C and D.

Table E-1. Meteorological Data Capture – Valid Hours per Month

Period	Meteorological Parameters											
	2-m Temp	10-m Temp	Δ T	WS (CLM)[1]	WD (CLM)	Sigma (CLM)	WS (RMY)[2]	WD (RMY)	Sigma (RMY)	RH	Solar	BP

1.0 Introduction

1.1 Project Summary

On behalf of The Pebble Limited Partnership, care of Pebble Mines Corp., its general partner, HCG Inc., dba Hoefler Consulting Group, is collecting meteorological data to support baseline environmental studies, mine design objectives, and future air quality permitting needs for the Pebble Project. This meteorological monitoring program currently consists of three PSD-quality meteorological monitoring stations located at the proposed mill site (Pebble 1), the tailings storage facility (Pebble 4), and port site (Pebble Port). An additional, non-PSD meteorological monitoring station (Pebble 3) is located near the tailings storage facility and is collecting data for engineering and mine design purposes. Of the three PSD-quality meteorological monitoring stations, continuous measurements were made at the Pebble 1 and Pebble Port stations beginning on August 1, 2005. This data report reflects data collected from January 1, 2006 through December 31, 2006 at the Pebble Port station.

Figure 1-1 is a map of the Pebble Project meteorological monitoring sites in southwest Alaska. Figures 1-2 and 1-3 provide a higher resolution map and photograph, respectively, of the Pebble Port station.

The Pebble Port station collects data for the following meteorological parameters:

- Air temperature, two meters above ground level (degrees Celsius [°C])
- Air temperature, ten meters above ground level (degrees Celsius [°C])
- Temperature difference (ΔT, “Delta T” (degrees Celsius [°C]))
- Wind speed (meters per second [m/s])
- Wind direction (degrees [°])
- Wind direction standard deviation (wind sigma [σ_θ])
- Relative humidity (percent [%])
- Solar radiation (Watts per square meter [W/m^2])
- Barometric Pressure (millibar [mb]).

Measurements of these parameters will provide at least two years of representative surface observations for use in air dispersion modeling and for future air quality permitting.

1.2 Measurements Method Table

Table 1-1 lists each parameter measured at the Pebble Port station and includes the sensor manufacturer and model number, measurement range, accuracy, sampling frequency, and sample averaging period. All instruments meet or exceed the U.S. Environmental Protection Agency (EPA) PSD requirements for range accuracies, thresholds, response times, resolutions, damping ratios, and other measures of instrument performance. For this project, wind speed and wind direction measurements are collected using two different types of PSD-quality sensors collocated at 10-meters above ground level. The Climatronics F460 (CLM) features a three-cup anemometer and separate wind vane while the RM Young 05305-AQ (RMY) is a propeller-vane anemometer, which is a single unit consisting of a four-blade propeller fitted to the front end of a wind vane. Deploying two separate wind sensors at the Pebble Port PSD station serves primarily to prevent the loss of valid data in the event that one of the sensors is damaged or subjected to inclement weather conditions, such as icing. Because the manufacturers' stated wind speed accuracy, wind direction accuracy, and wind speed threshold values of the CLM sensor are better than those of the RMY sensor, the CLM sensor has been designated as the "primary" wind instrument for the Pebble Port station.

1.3 Variations from the Quality Assurance Project Plan

During the first monitoring year, there were no variations from the Pebble Project Meteorological Monitoring Quality Assurance Project Plan (QAPP).

Table 1-1. Meteorological Measurement Methods

Parameter	Sensor Manufacturer/ Model Number	Measurement Method	Range	Accuracy	Sampling Frequency	Averaging Period
Ambient Temperature	Met One, Inc. Model 062 MP	Solid state thermistor	+50°C to -50°C	± 0.05°C	1 second	1 hour
Wind Speed[1]	Climatronics, Inc. F460 (P/N 100075)	Three-cup anemometer, LED photo chopper	0 to 65 m/s	± 0.15 m/s or 1%	1 second	1 hour
Wind Direction[1]	Climatronics, Inc. F460 (P/N 100076)	Light-weight vane, Low torque potentiometer	0 to 360°	± 2°	1 second	1 hour
Wind Speed[1]	RM Young Co. 05305-AQ	Propeller, magnetically induced AC sine wave	0 to 40 m/s	± 0.2 m/s or 1%	1 second	1 hour
Wind Direction[1]	RM Young Co. 05305-AQ	Light-weight vane, Low torque potentiometer	0 to 360°	± 3°	1 second	1 hour
Relative Humidity	Vaisala, Inc. HMP 45C	Capacitive polymer chip	0.8 to 100%	± 2%	1 second	1 hour
Solar Radiation	LI-COR, Inc. LI-200	Silicon photovoltaic detector	0 to 3,000 W/m^2 (400 to 1,100 nm)	± 5%	1 second	1 hour
Barometric Pressure	Vaisala, Inc. PTB 101B	Silicon capacitive sensor	600 to 1060 mb	± 0.5 mb	1 hour[2]	N/A[2]

[1]Wind speed and wind direction measurements are collected using two different types of PSD-quality sensors.

[2]Instantaneous barometric pressure measurements are collected for 1 second during every hour.

Figure 1-1. Map of the Pebble Project Area

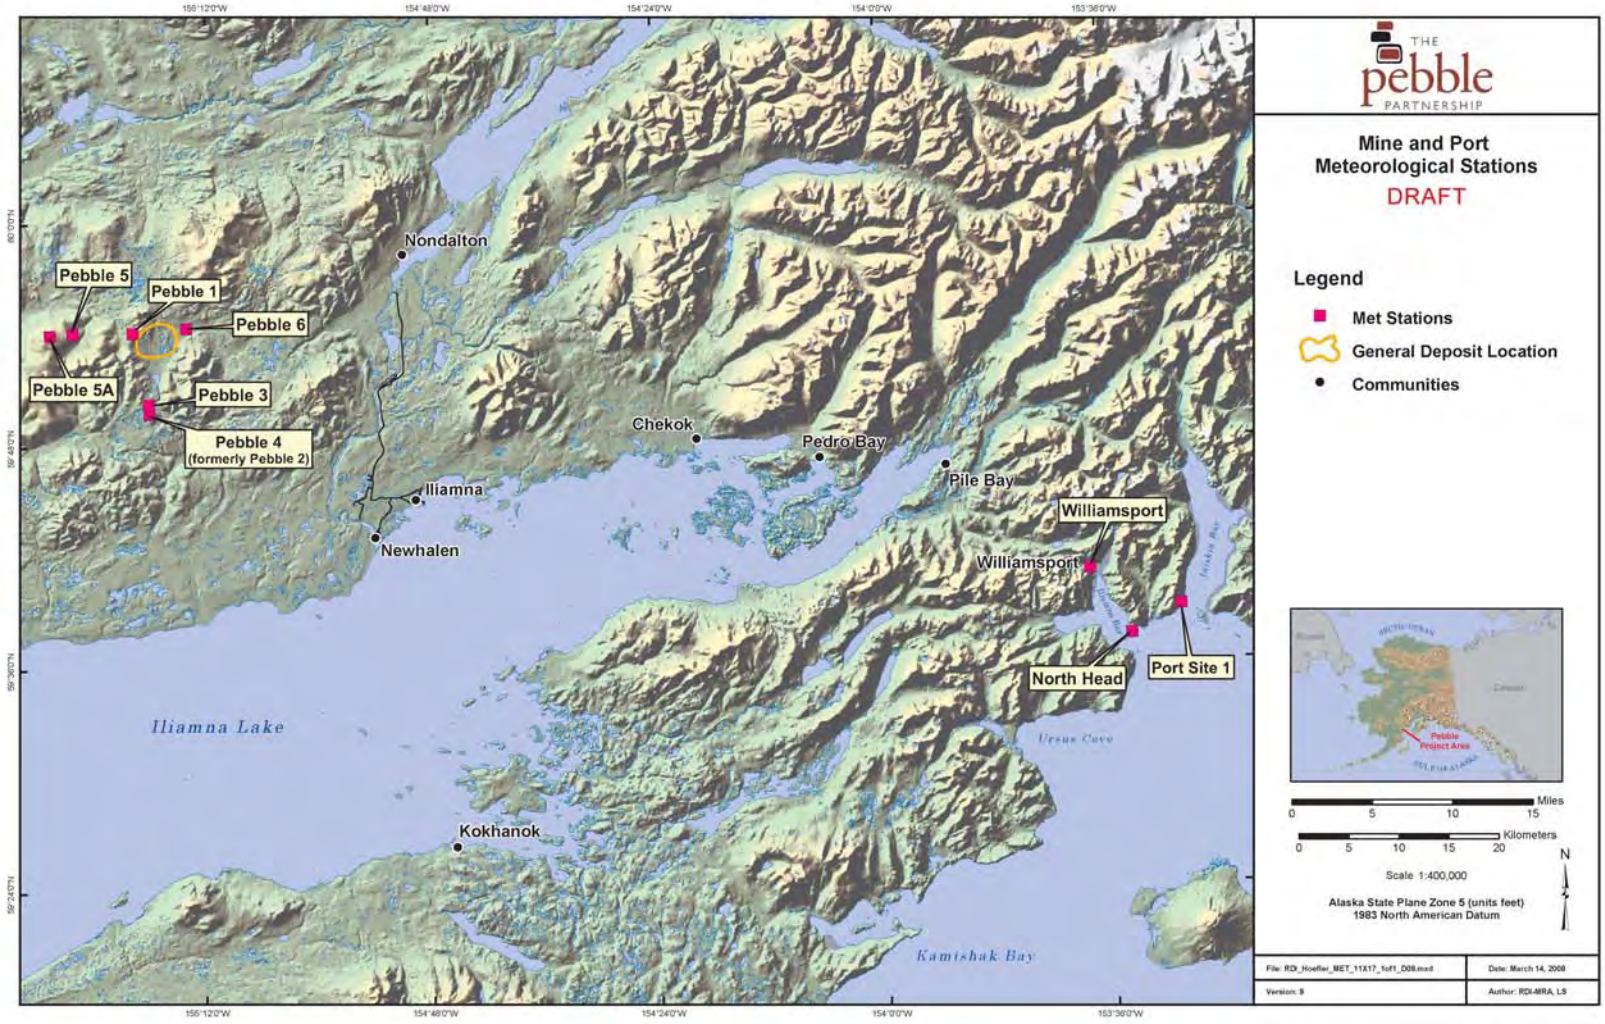

Figure 1-2. Map of the Pebble Port PSD Station

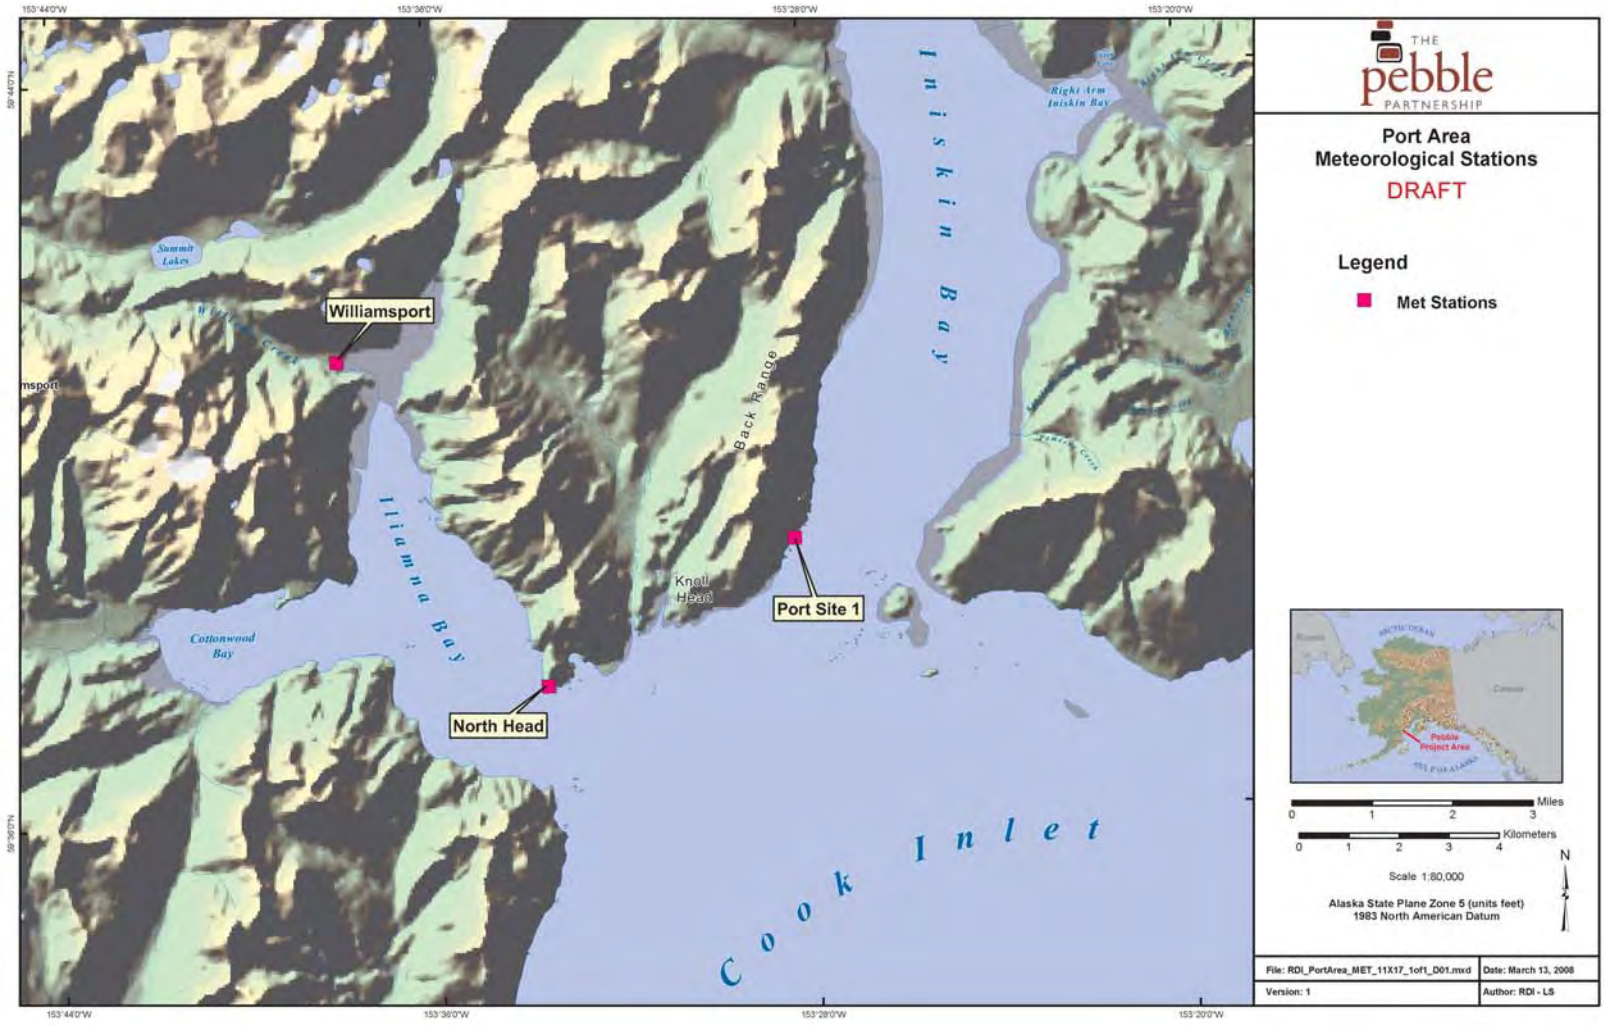

Figure 1-3. Pebble Port Meteorological Monitoring Station

2.0 Station Performance Summary

2.1 Significant Project Events

Table 2-1 summarizes the significant events that occurred at the Pebble Port station relevant to the 2006 year of meteorological monitoring.

Table 2-1. Chronology of Significant Events

Date	Event
June 21-25, 2005	Initial site installation and setup.
June 25, 2005	Initial Performance Audit.
January 1, 2006	Beginning of 2006 monitoring year.
January 16, 2006	Semi-annual performance audit.
January 22, 2006	Storm up-ends station shelter and altered the alignment of the Climatronics wind direction sensor.
January 29, 2006	First visual confirmation that station shelter had been up-ended during storm on January 22, 2006.
February 8, 2006	Port shelter righted and visually inspected for damages.
February 10, 2006	Calibration and audit of wind sensors. Climatronics wind direction sensor was found to be out of alignment from the January 22, 2006 storm, was recalibrated, and passed a second audit. Data correction applied to account for sensor misalignment.
August 21, 2006	Second annual systems performance audit and calibration.
August 7, 2006	Attempted flight to station.
August 21, 2006	Audit and calibration, replaced Climatronics Wind Direction and R.M. Young Wind Direction bearings and the 2 meter lower aspirator housing
October 11, 2006	Tested Wind Direction sensor
November 2, 2006	Thermo-Electric Generator turned on at about 1100 hrs.
December 31, 2006	End of 2006 monitoring year.

2.2 Missing, Invalid, and Adjusted Data

The data collected at the Pebble Port station were carefully reviewed during the quality assurance process. Some data were removed as a result of planned site activities, including data collected during station system and performance audits and calibrations. All data were validated only after being screened by the criteria listed in Table 8-4 of *Meteorological Monitoring Guidance for Regulatory Modeling Applications* (EPA-454/R-99-005). Table 2-2 lists the quantities of data that were flagged according to EPA criteria, yet not removed from the refined data set. All flagged data were carefully examined, but generally remained in the refined data set unless dictated by certain circumstances, including values outside the normal range of variation, consecutive repetitive values recorded for an unidentified reason, maintenance activity at the site, and impairing damage to sensors.

Table 2-2. Percentage of Final Data Flagged

Parameter	Flagging Criteria[1]	Percent Flagged
Wind Speed (Climatronics)	Value is < 0 m/s, > 25 m/s	0.0%
	< 0.1 m/s variation for 3 consecutive hours	1.0%
	<0.5 m/s variation for 12 consecutive hours	0.0%
Wind Direction (Climatronics)	Value is < 0°, > 360°	0.0%
	<1° variation over 3 consecutive hours	1.3%
	< 10° variation over 18 consecutive hours	0.5%
Wind Speed (RM Young)	Value is < 0 m/s, > 25 m/s	0.0%
	< 0.1 m/s variation for 3 consecutive hours	0.6%
	<0.5 m/s variation for 12 consecutive hours	0.0%
Wind Direction (RM Young)	Value is < 0°, > 360°	0.0%
	<1° variation over 3 consecutive hours	0.9%
	< 10° variation over 18 consecutive hours	0.5%
Temperature (2 meters)	> 5°C variation from previous hour	0.0%
	< 0.5°C variation for 12 consecutive hours	0.9%
	Value is > record high, < record low	0.0%
Temperature (10 meters)	> 5°C variation from previous hour	0.0%
	< 0.5°C variation for 12 consecutive hours	0.9%
	Value is > record high, < record low	0.0%
Temperature Difference, ΔT	Value is > 0.8°C during the daytime	1.8%
	Value is < -0.8°C during the night	0.0%
	Value is > 5°C, < -3°C	0.0%
Relative Humidity (Dew Point Temperature)[2]	Value is > ambient temperature	0.0%
	> 5°C variation from previous hour	0.1%
	< 0.5°C variation for 12 consecutive hours	1.3%
	Equals ambient temperature for 12 consecutive hours	0.0%
Solar Radiation	> 0 W/m^2 at night	0.0%
	Greater than the maximum possible value for date and latitude	0.0%
Barometric Pressure	> 1060 mb (sea level)	0.0%
	< 940 mb (sea level)	0.0%
	> 6 mb variation for 3 consecutive hours	0.0%

[1]Based upon Table 8-4: Suggested Data Screening Criteria in *Meteorological Monitoring Guidance for Regulatory Modeling Applications* (EPA-454/R-99-005).
[2]Guidance document provides criteria relative to dew point temperature.

2.3 Network Data Completeness

Data completeness is a measure of the amount of data actually collected compared to the amount of data that could have been collected. Data completeness was calculated by dividing the number of valid hours of data by the total number of hours during the monitoring period. The data quality objective (DQO) for data completeness for the Pebble Project Meteorological Monitoring Program is 90 percent data capture per quarter for each parameter listed in Section 1.1. Table 2-3 provides a summary of data completeness, in terms of a percentage, for the first monitoring year at the Pebble Port station.

The Pebble Port meteorological monitoring station met all PSD requirements during the monitoring year with the exception of the secondary wind speed sensor, which did not meet the minimum PSD monitoring requirement of 90 percent data capture or better during Monitoring Quarter C (July 1, 2006 through September 31, 2006) and Quarter D (October 1, 2006 through December 31, 2006) as a result of an unknown sensor failure. However, the collocated primary PSD-quality wind speed sensor (Climatronics, model F460, P/N 100075) had greater than 90 percent data capture during this same period. Therefore, measurements from the primary PSD-quality instrument will be used to fulfill PSD data capture requirements for Monitoring Quarters C and D.

Table 2-3. Pebble Port Station Percent Data Capture

Period	Meteorological Parameters											
	2-m Temp	10-m Temp	Δ T	WS (CLM)[1]	WD (CLM)	Sigma (CLIM)	WS (RMY)[2]	WD (RMY)	Sigma (RMY)	RH	Solar	BP

Not applicable.

2.5 Accuracy Statistics

2.5.1 Instrument Calibration Statistics

Not applicable.

2.5.2 Independent Quality Assurance Audits

A technical systems audit was performed at the Pebble Port station on June 25, 2005. The power supply, data acquisition system (DAS), communications system, and sensors all worked properly. The systems audit indicated that the station is well-planned, equipped with PSD-quality equipment, and properly sited according to criteria recommended by EPA. The operator provided adequate manuals for system maintenance and proper documentation to report operation and quality control activities. The operator was knowledgeable and competent with all meteorological equipment, communications equipment, and the power supply system. Appendix C contains the complete technical systems audit report.

An initial performance audit of the station was conducted on June 25, 2005. The performance audit involves reading the DAS output for each meteorological sensor and comparing the value with the input from an appropriate piece of audit equipment or from calibrated instruments collocated with the sensor. For each reading, the difference between the station value and the predicted value is compared with established PSD limits to assess the accuracy of the sensor. The results of the initial performance audit are presented in Table 2-4. The complete performance audit report is available in Appendix C.

Table 2-4. June 25, 2005 Initial Performance Audit Summary

Parameter	EPA Limit	Units	Maximum Absolute Error	Pass/Fail
Datalogger Time (AST)	≤ ±5:00	Min:Sec	00:02	Pass
Temperature Accuracy (2-m)	≤ ±0.5	°C	0.35	Pass
Temperature Accuracy (10-m)	≤ ±0.5	°C	0.30	Pass
Temperature Difference (ΔT)	≤ ±0.1	°C	0.05	Pass
Wind Speed[1] Accuracy	≤ ±0.2 + 5%	m/s	0.0	Pass
Wind Speed[1] Torque	≤ ±0.005	oz-in	< 0.003	Pass
Wind Direction[1] Alignment	≤ ±3	°	1.1	Pass
Wind Direction[1] Linearity	≤ ±3	°	0.9	Pass
Wind Direction[1] Torque	≤ 0.104	oz-in	0.060	Pass

Relative Humidity (Dew Point Temperature)	≤ ±1.5	°C	0.4	Pass
Barometric Pressure	≤ ±3	mb	1.9	Pass
Solar Radiation	≤ (±5 + 10 W/m^2)	% obs	NC[3]	N/A

[1]Parameters audited for Climatronics wind sensor.
[2]Parameters audited for RM Young wind sensor.
[3]NC = Not completed.

Subsequently, a performance audit was conducted on January 16, 2006 and a performance and systems audit was conducted on August 21, 2006. Each sensor was challenged with certified audit equipment and tested for compliance with PSD performance accuracy requirements. A summary of the results of these audits are presented in Tables 2-5 and 2-6. The complete performance audit reports are available in Appendix C.

Table 2-5. January 16, 2006 Annual Performance Audit Summary

Parameter	EPA Limit	Units	Maximum Absolute Error	Pass/Fail
Datalogger Time (AST)	≤ ±5:00	Min:Sec	00:20	Pass

[1]Parameters audited for Climatronics wind sensor.

[2]Parameters audited for RM Young wind sensor.

[3]NC = Not completed.

A performance audit was conducted on January 16, 2007. On January 16, 2007 the RM Young wind instrument failed the audit for an unknown reason. A summary of the results of these audits are presented in Table 2-7.

A technical systems audit was performed during both the August 21, 2006 performance audits. During this audit, the power supply, DAS, communications system, and audited sensors all worked properly. The systems audit found that the station is well-planned, equipped with PSD quality equipment, and properly sited according to criteria recommended by EPA. The operator provided adequate manuals for system maintenance and proper documentation to report operation and quality control activities. The operator was knowledgeable and competent with all meteorological equipment, communications equipment, and the power supply system. Appendix C contains the complete technical systems audit report.

3.0 Monitoring Data Network Summary

3.1 Air Quality Data Summary

Not applicable.

3.2 Meteorological Data Summary

3.2.1 Wind Speed (WS) and Wind Direction (WD) Climatology

Table 3-1 provides a statistical summary of Climatronics (CLM) and RM Young (RMY) wind speed measurements during the first year of meteorological monitoring at the Pebble Port station. The mean hourly average wind speed during the monitoring year was 4.77 m/s and 4.40 m/s for the CLM and RMY sensors, respectively. Maximum hourly average wind speeds of 20.42 m/s and 17.30 m/s were measured by the CLM and RMY sensors, respectively, at 7:00 PM on January 22, 2006. Table 3-2 provides the mean and maximum daily wind speeds at the Seldovia Airport, located approximately 100 km from the Port Station. During the monitoring year the mean daily average wind speed at the Seldovia airport was 1.45 m/s, while the maximum daily average wind speed was 13.36 m/s, recorded on November 13, 2006.

Table 3-1 indicates that the RMY statistical values are generally 95% of the CLM values. A further analysis revealed the negative bias of the RMY sensor relative to the CLM sensor was found to be greatest during periods of turbulent winds. In particular, the agreement between the RMY and CLM measurements was best (>95%) when wind sigma values were less than 30 degrees and when winds were blowing from the northern end of Iniskin Bay. This observation is in agreement with studies that have found propeller-vane instruments have an inherent negative bias in turbulent winds due to the propeller-vane lagging behind the instantaneous wind direction. (e.g., Kristensen, 1994; Kristensen et al., 2001). While the cup anemometer appears to be less susceptible to under-reporting of wind speeds in turbulent winds, the vane-propeller anemometer was found to be a high-precision PSD-quality instrument less susceptible to icing than the cup anemometer. Therefore, the deployment of both sensor types has been advantageous for meteorological monitoring under an array of inclement weather conditions encountered at the Pebble Project site.

Figure 3-1 shows first year wind roses for the CLM and RMY wind instruments collocated at the Pebble Port station. During the monitoring year, winds were predominantly from the north and northeast with infrequent winds from the south and northwest. Figures 3-2 and 3-3 present the quarterly wind roses for the CLM and RMY sensors, respectively. All of the quarterly wind roses are characterized by predominant wind component from the north and northeast. In addition, the Quarters B and C wind roses display wind components from the south and southwest.

Table 3-1. Average and Maximum Wind Speeds

Monitoring Period	Mean Hourly Average Wind Speed (m/s) (CLM)	Mean Hourly Average Wind Speed (m/s) (RMY)	Maximum Hourly Average Wind Speed (m/s) (CLM)	Maximum Hourly Average Wind Speeds (m/s) (RMY)
Quarter A	5.63	5.40	20.42	17.30
Quarter B	4.06	3.86	14.80	14.12
Quarter C	3.98	3.60	16.01	15.15
Quarter D	5.42	--[1]	18.36	--[1]
Monitoring Year	4.77	4.40	20.42	17.30

[1] RM Young wind instrument data invalidated for Quarter D due to failed audit

Table 3-2. Average and Maximum Wind Speeds at Seldovia Meteorological Station

Monitoring Period	Mean Daily Average Wind Speed (m/s)	Maximum Daily Average Wind Speed (m/s)
Quarter A	1.43	10.02
Quarter B	1.30	10.02
Quarter C	1.20	10.02
Quarter D	1.86	13.36
Monitoring Year	1.45	13.36

Tables 3-3 through 3-7 are the annual and quarterly wind analysis tables for the CLM wind measurements. Tables 3-8 through 3-12 are the annual and quarterly wind analysis tables for the RMY wind measurements.

Figure 3-4 shows the 2006 year wind rose for the Climatronics wind sensor superimposed over a map of the Pebble Port site and vicinity. The wind rose is centered over the Pebble Port station and shows that, on an annual basis, winds at the site predominantly blow parallel to the shoreline and from the north.

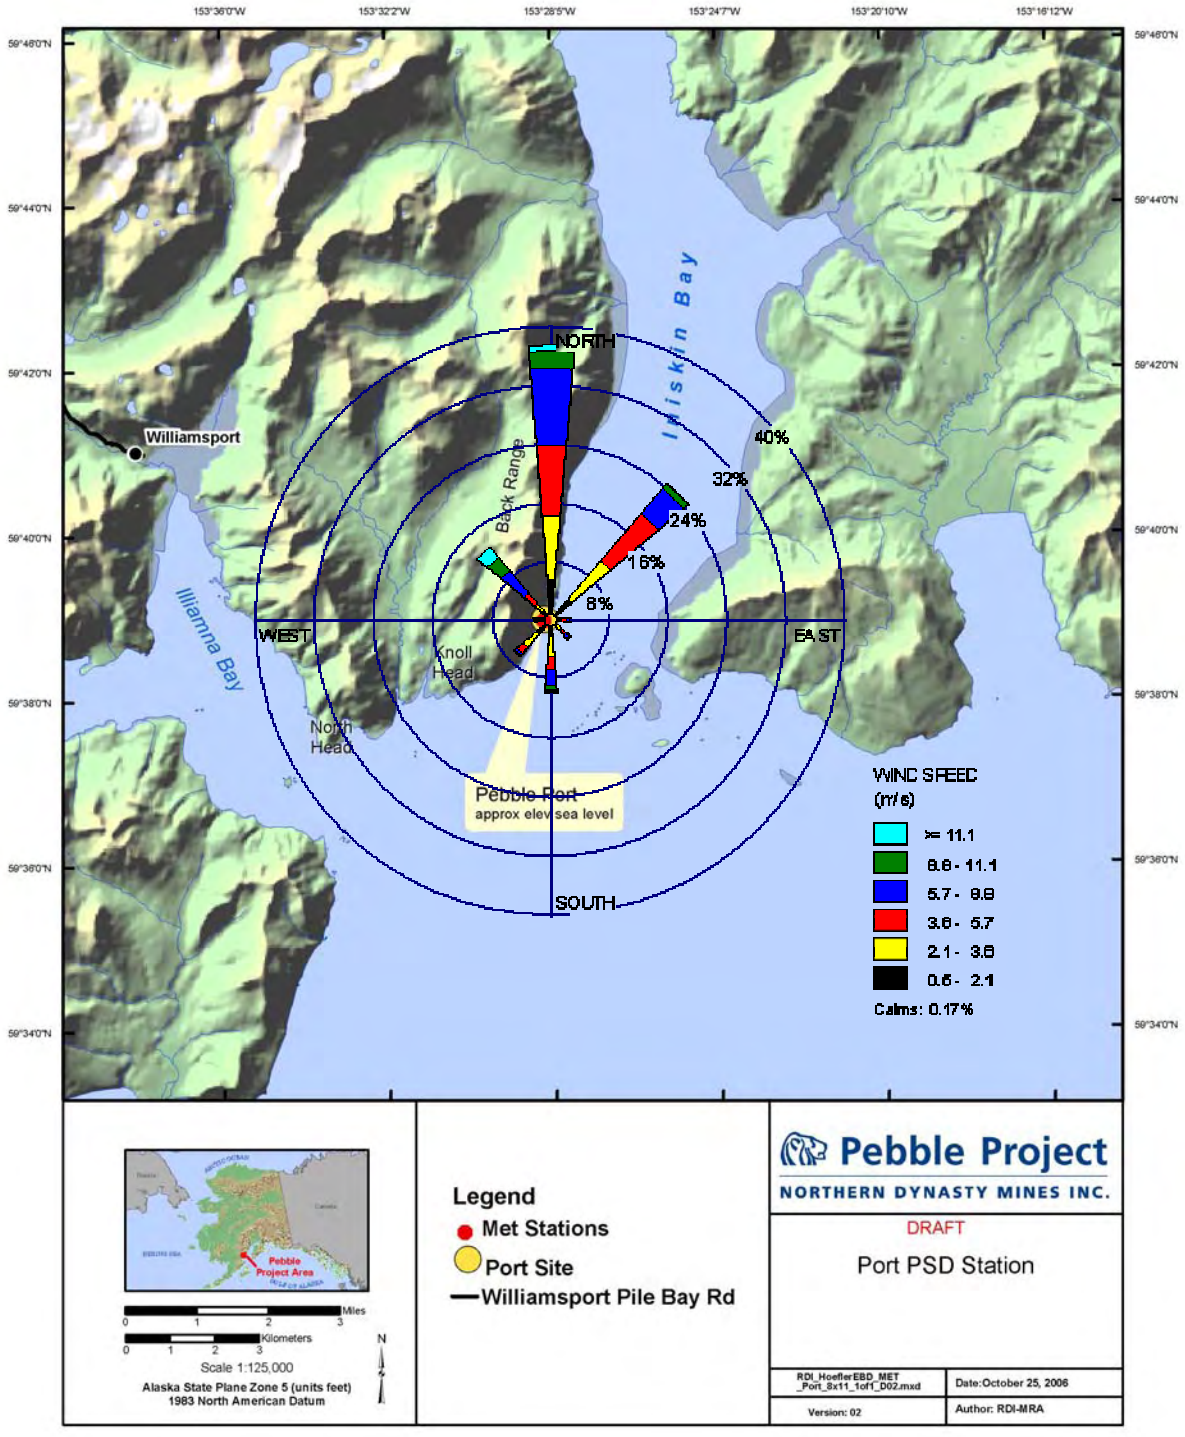
Figure 3-4. Annual[1] Wind Rose Superimposed on Site Map



[1] 2006 monitoring year: January 1, 2006 to December 31, 2006.

3.2.2 Temperature Climatology

Tables 3-12 and 3-13 give the maximum and minimum daily mean temperatures, monthly mean temperatures, and maximum and minimum hourly average temperatures for the 2-meter and 10-meter temperature measurements, respectively. The 2006 annual mean temperature was 3.25°C at the 2-meter height. This annual mean temperature is slightly higher in comparison to the annual mean temperature of 3.21°C observed at the Seldovia meteorological station from January 1, 2006 through December 31, 2006. Hourly average temperatures at the Pebble Port station varied from a maximum of 21.9°C on July 12, 2006 to a minimum of -24.1°C on January 27, 2006.

Figure 3-5 provides a graph of the 2-meter and 10-meter hourly average temperatures. Considerable temperature variations occurred throughout the late-autumn and winter months. Figure 3-5 also includes a plot of average daily temperatures recorded at the meteorological monitoring station in Seldovia, Alaska.

Figure 3-6 shows a plot of the vertical temperature difference (the difference between 10-m and 2-m temperature values) during the monitoring year. The greatest positive vertical temperature difference was 3.7°C measured on May 27, 2006. The greatest negative temperature difference was -2.6°C measured on August 8, 2006.

3.3.3 Other Meteorological Parameters

Other meteorological parameters measured at the Pebble Port station include relative humidity, barometric pressure, and solar radiation.

Table 3-15 provides a summary of the relative humidity, barometric pressure, and solar radiation at the Pebble Port station during the 2006 monitoring year.

Figure 3-7 is a plot of the annual hourly average relative humidity. Relative humidity at the Pebble Port site varied from a low of 23.6 percent on March 11, 2006 to a high of 100 percent. The mean relative humidity during the monitoring year was 75.8 percent. The mean relative humidity at the Seldovia Airport meteorological station for the monitoring period was 80 percent.

Figure 3-8 is a plot of the annual hourly instantaneous barometric pressure measurements. Barometric pressure varied from a minimum of 960 mb during a period of night between December 19 and 20, 2006, to a maximum of 1,040 mb observed on February 16, 2006. The mean barometric pressure during the monitoring year was 1,006 mbar. The mean barometric pressure at the Seldovia Airport meteorological station for the monitoring period was 1007 mb.

Figure 3-9 is a plot of the annual hourly average solar radiation. The maximum hourly average solar radiation was 818 W/m^2 recorded on June 4, 2006 at 2:00 PM. The mean hourly average solar radiation for the monitoring year was 86 W/m^2.

Relative humidity, barometric pressure, and solar radiation data are available in monthly tabular format in Appendix D.

Table 3-15. Relative Humidity, Barometric Pressure, and Solar Radiation Summary

Data Processing Specifications and Statistical Formulae

A.1 Data Recovery Percentage

Data completeness for meteorological monitoring methods was calculated assuming a minimum of 90 percent valid hourly average data to calculate quarterly average data completeness and a minimum of 90 percent quarterly data completeness for four consecutive quarters.

Quarterly data completeness (DC_i) was determined using the following equation:

$$DC_i = h_v/h_i \times 100$$

Where: h_v = number of hours of valid data actually collected
h_i = number of possible valid hours of data collection during the monitoring period

1.0 INTRODUCTION

Hoefler Consulting Group, Inc. (HCG) operates meteorological monitoring stations for Northern Dynasty Mines, Inc. (NDM) in support of the Pebble Mine Project near Iliamna, Alaska. The air monitoring program is one component of ongoing baseline environmental studies being conducted to support mine permitting, mine design and mine transportation infrastructure development. The stations meet Prevention of Significant Deterioration (PSD) guidelines, although PSD permits may not be required. This report covers the Port monitoring station located near the proposed mine port site.

The Pebble Port Station is located on the west shore of Iniskin Bay, near the southern end of the bay. The station is situated on a 50' high knoll, very near the water's edge. The Port Station consists of an instrumented 11-meter sectional tower secured with three guy wires. Approximately 20' south of the tower is a 6' by 8' insulated building which houses the datalogger and power supply system. The Pebble Port Station is instrumented with PSD quality sensors monitoring the following parameters:

- Ambient Temperature (ºC): Met One 062MP Thermistor Probe at 2-m
- Temperature Difference (ºC): Met One 062MP Thermistors at 2-m and 10-m
- Wind Speed 1 (m/s): Climatronics F460 P/N 100075 Wind Speed Sensor
- Wind Direction 1 (°): Climatronics F460 P/N 100076 Wind Direction Sensor
- Wind Speed 2 (m/s): RM Young 05305 Wind Monitor-AQ
- Wind Direction 2 (°): RM Young 05305 Wind Monitor-AQ
- Sigma Theta (°): Campbell Scientific CR10X DAS calculated (Yamartino)
- Relative Humidity (%RH): Vaisala HMP45AC Relative Humidity Sensor
- Barometric Pressure (mbar): Vaisala PT101B Barometric Pressure Sensor
- Solar Radiation (W/m2): LI-COR Li-200SX Solar Radiation Pyranometer.

This report has been prepared for NDM to serve as an official review of the Pebble Port Station and a review of the overall Pebble Project Meteorological Monitoring Program. To that end, Systems and Performance Audits were undertaken in order to help demonstrate that the equipment and procedures used for collecting meteorological data by HCG meet the requirements set forth by the U.S. Environmental Protection Agency (EPA) and the Alaska Department of Environmental Conservation (ADEC).

2.0 SYSTEMS AUDIT

2.1 Systems Audit Methodology

In the *Quality Assurance Handbook for Air Pollution Measurement Systems* and the *Meteorological Monitoring Guidance for Regulatory Modeling Applications*, EPA provides guidance for conducting systems audits. EPA recommends that a systems audit be conducted to serve as a qualitative review of all aspects of a meteorological monitoring program. The systems audit includes a review of the program plan, station site, facilities, equipment, personnel, procedures, record keeping, data validation and data reporting. The systems audit should be completed within the first 30 days of operation and every year thereafter.

The *Quality Assurance Project Plan for the Pebble Project Meteorological Monitoring Program* was completed by HCG in August 2006. This systems audit consisted of a review of this document, site visits and personnel interviews. Personnel were also observed during station maintenance and calibration operations. All aspects of the program not specifically mentioned in the Plan were reviewed to determine consistency with EPA and ADEC guidelines. The complete systems audit report contained in Appendix A is organized into six major sections; 1) General Program Information, 2) Monitoring Program Staff Organization, 3) Meteorological Monitoring Station Equipment, 4) Standard Operating Procedures, 5) Documentation, 6) Data Processing and Validation, 7) Quality Assurance and Quality Control (QA/QC), and 8) Comments and Suggestions. Each section consists of a question-answer format with additional comments to provide clarity. Flow charts are also used to accurately document program staff organization and the data handling process. A complete list of the references used for the systems audit is contained in Section 4.

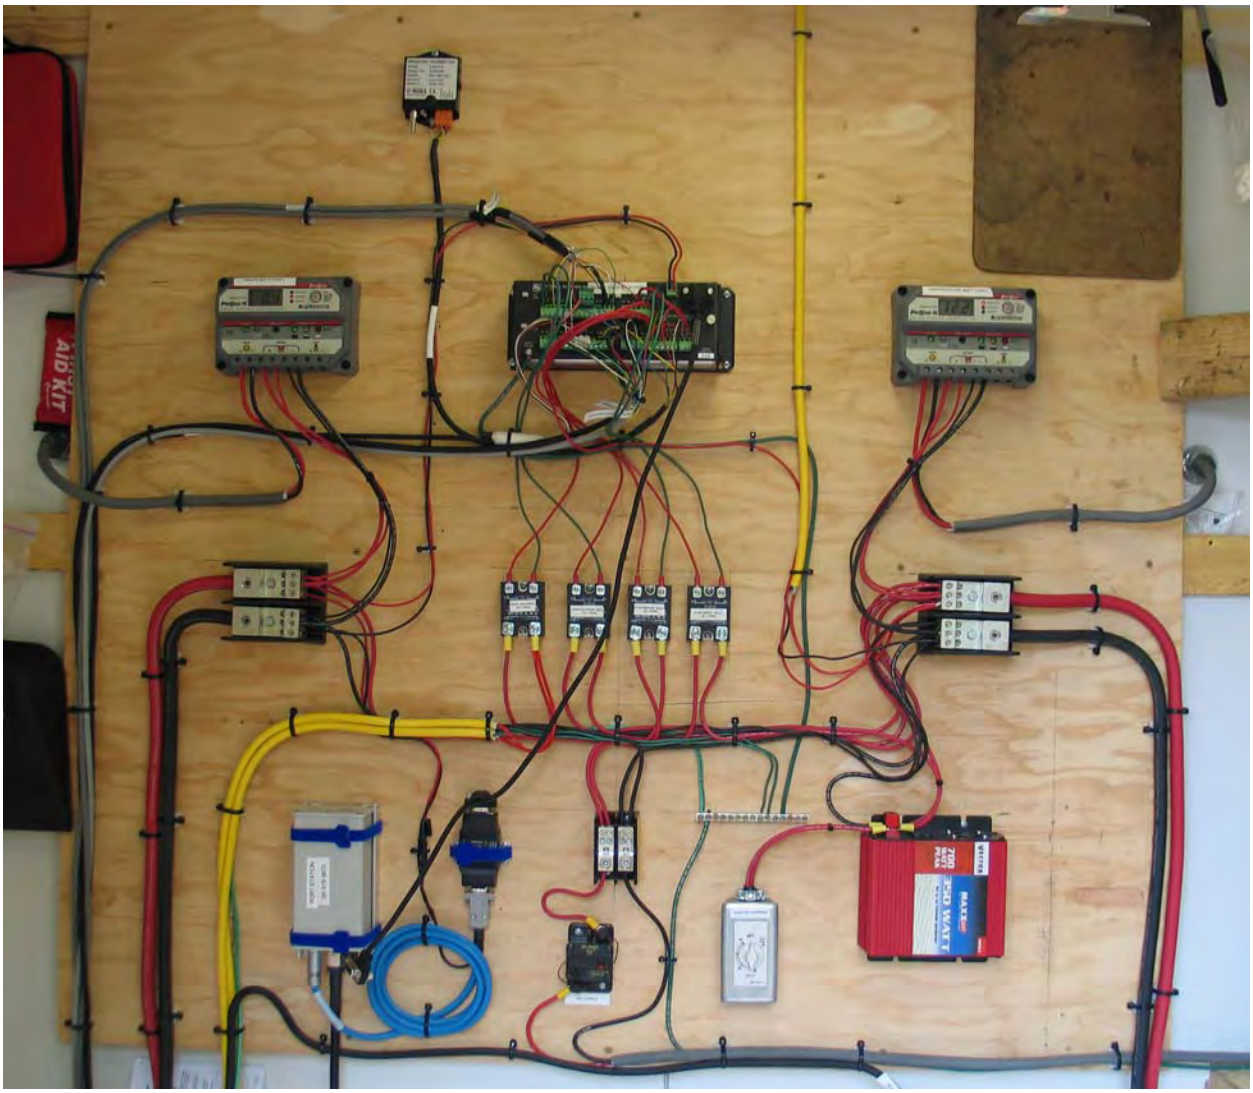
2.2 Meteorological Station On-Site Systems Audit

The on-site systems audit of the Pebble Port Station was conducted on June 25, 2005. Eric Brudie of HCG completed the systems audit with Steve Mackey and Jared Cockman of HCG and Robert Parks of NDM assisting and witnessing. Mr. Brudie serves as an independent auditor on this project and is not involved with day to day operations of the station.

The Pebble Port meteorological monitoring station is founded on a stable, well anchored tower with PSD quality sensors securely affixed. In order to protect instrumentation wires from animals; 2” liquid-tight conduit runs from the 12’ height on the tower to the prefab building. The data acquisition system (DAS), communications system, solar

controllers and power distribution system are mounted on a 4' by 4' plywood wiring panel mounted in the building, see photo.

Figure 2-1 Pebble Port Station DAS Wiring Panel



The Campbell Scientific CR10X DAS wiring is well organized and needs no further discussion. Constant communication between the DAS and a dedicated polling computer in the HCG office is integral to this installation. A Campbell Scientific SC932A interface converts the DAS signal to a RS-232 DCE modem signal. Three FreeWave spread spectrum radio modems transmit the signal to a SixNet industrial phone modem which is linked to the grid near Seldovia, Alaska. The met station radio and base radio rely on directional Yagi antennas focused on an omni-directional antenna at the repeater radio. The repeater radio is powered by one 35-Watt solar panel buffered through a solar controller and five 100 Amp-Hr deep cycle gel cell batteries.

Power generation at the meteorological monitoring station consists of four 50-Watt solar panels and a 21-Watt Global Thermoelectric Model 5030 Thermo-Electric Generator (TEG). One solar panel is dedicated to the DAS and meteorological instrumentation; wired through a Morningstar ProStar-15 solar controller and buffered through two 200 Amp-Hr deep cycle gel cell batteries. Three panels are dedicated to the aspirator fans, Climatronics heaters, shelter lighting and 120VAC power; wired through a Morningstar ProStar-15 solar controller and buffered through two 200 Amp-Hr deep cycle gel cell batteries. The shelter lights and 120VAC inverter for laptop use are routed through manual timers to ensure use only when operators are on site. During the winter months, November through April, the TEG is turned on to supplement the aspirator/heater power system. Aspirator fans and heaters are controlled through relays connected to the DAS control ports. Logic programmed into the DAS reduces power consumption by limiting heater use to weather conditions conducive to icing and turns fans off at night when voltage is low, considered an upset condition. Also the TEG power is routed through relays which shunt power to the critical DAS/sensor system during upset conditions.

2.3 Operations, Data Management and Documentation Systems Audit

This phase of the systems audit consists of a review of the HCG *Quality Assurance Project Plan for the Pebble Project Meteorological Monitoring Program* (Plan), and other system documentation, and a review of system operations. System operations include physically running the station and subsequent data management.

The Plan is a comprehensive document which adequately details the Pebble meteorological monitoring program. Program objectives, installations, operations, data management and quality assurance are all clearly outlined. Equally, the Pebble Port Station is representative of the Plan design. The Plan provides standard operating procedures and standard forms for all equipment field calibrations and audits. Station operators also had complete DAS and meteorological sensor manuals on hand at the station. Plan and documentation review are covered further in Appendix A.

Station operators were observed during calibration and maintenance procedures and appeared knowledgeable about all facets of operating the monitoring station. Data are downloaded daily using an automated script on a dedicated polling computer located at the HCG office. The raw data are appended to a station file located on the HCG server, which is backed up daily. The data manager copies the raw data to a custom Access/Excel database, leaving the raw data unaltered. The custom database creates a series of graphs of all meteorological data as well as some station operational parameters. These plots are reviewed 5-6 days per week in order to immediately

identify station upsets. An example is a graph of solar radiation and battery voltage; which reveals potential problems with daily charge cycles. Both the Climatronics and RM Young Wind sensor data are plotted together to indicate problems with one of the sensors. All station parameters are plotted with ranges and pairings intended to best reveal upset conditions. Problems are immediately identified and corrective action planned and executed. Steps are taken to flag data which may have been identified as suspect during this graphical data review. Data generated during station maintenance, audits and calibrations are also flagged as invalid.

Prior to compilation of data summary reports, data are screened using EPA recommended screening criteria. Data flagged as outliers by the screening program are further reviewed for consistency with prevailing conditions and then permanently invalidated or validated. Data ultimately invalidated are permanently removed from the database and the reasoning is codified in a special column in the database. This cleaned dataset is used for all subsequent data summaries, wind roses, data reports and capture rate calculations. More detailed discussion of the operations and data management are contained in the Systems Audit Appendix A.

2.4 Comments and Suggestions

The Pebble Port Station is a well designed and operated meteorological monitoring station. The remote station is equipped with a robust and sophisticated power supply. The systems audit revealed that HCG possesses the necessary organization, personnel, training, equipment, quality assurance, and quality control procedures to accurately collect and report PSD quality data. HCG adequately maintains the Pebble Port Station and practices sufficient data review and preventive maintenance to avoid unnecessary data loss.

The following recommendations are made to the program in order to improve the operation of the stations and ensure their operation is in accordance with standards:

- Create custom site visit checklists
- Keep a file on site containing copies of previous checklists.

3.0 PERFORMANCE AUDIT

3.1 Performance Audit Methodology

During the performance audit, the station datalogger is interfaced with a portable laptop computer to display the outputs for the meteorological sensors. The value of each meteorological sensor is compared to the output value from the appropriate piece of audit equipment or from calibrated instruments collocated with the sensor. The difference between the station's datalogger reading and the output from each audit instrument is compared with established PSD limits to determine the accuracy of each sensor. Additionally, threshold torques for wind speed and wind direction are measured with audit equipment and compared with manufacturer torques corresponding to the PSD threshold speed of 0.5 m/s. Table 3-1 provides a summary of the performance audit methods and limits used to audit each parameter at the stations.

Table 3-1 Performance Audit Methods and Acceptable Limits

Parameter	Audit Method	EPA/Manufacturer Limit
Datalogger Time	NOAA Clock	≤ ±5:00 minutes from AST
Temperature Accuracy	Collocated NIST thermistor	≤ ±0.5 °C
Temperature Difference	Collocated NIST thermistor	≤ ±0.1 °C
Wind Speed Accuracy	Synchronous rpm motor	≤ ±0.2 m/s + 5 % observed
Wind Spd Torque (Clim)	Torque watch	≤ 0.35 g-cm (0.0049 oz-in)
Wind Spd Torque (RMY)	Torque watch	≤ 1.0 g-cm (0.014 oz-in)
Wind Direction Alignment	GPS, compass or landmark	≤ ±5° from true azimuth
Wind Direction Accuracy	Linearity tester	≤ ±5° per audit point
Wind Direction Linearity	Linearity tester	≤ 3° mean absolute average
Wind Dir Torque (Clim)	Torque watch	≤ 7.5 g-cm (0.104 oz-in)
Wind Dir Torque (RMY)	Vane torque gauge	≤ 11 g-cm (0.153 oz-in)
Relative Humidity	Collocated NIST RH sensor	≤ ±1.5 °C of dew point
Barometric Pressure	Collocated NIST BP sensor	≤ ±3 mbar
Solar Radiation[1]	Collocated NIST sensor	≤ ±5% of input+resolutuion[2]

1. Solar radiation not audited.
2. This audit limit is modified from PSD standard, as discussed below.

3.1.1 Data Acquisition System

An audit of the datalogger is conducted by comparing all datalogger outputs to the audit standards, as described below. The datalogger time is checked against an instantaneous time reading from the National Oceanic and Atmospheric Administration (NOAA) clock in Boulder, Colorado, via a global positioning system (GPS) handheld unit or telephone contact with the NOAA clock.

3.1.2 Air Temperature and Air Temperature Difference

The 2-meter and 10-meter thermistors are removed from their aspirator shields and collocated with a National Institute of Standards and Technology (NIST) traceable digital thermometer. The station thermistors and the transfer standard NIST thermometer are taped together and immersed in insulated thermoses containing a series of water baths; hot water (35°C to 45°C), warm water (15°C to 25°C), and a water/ice bath (0°C). Each water bath is agitated and allowed to equilibrate before simultaneous readings are taken from the three instruments. The difference between the individual station thermistors and the NIST standard are compared to the PSD temperature accuracy limit of ±0.5°C. The difference between the two station thermistors (10-m°C minus 2-m°C) is compared to the PSD temperature difference limit of ±0.1°C.

3.1.3 Wind Speed

Anemometers are audited to determine their accuracies in reading known wind speeds and to ascertain the sensor's threshold torque. The Climatronics and RM Young sensors are audited in very similar manners and are discussed together. The instruments are tested after removal from the tower and after removal of the sensor's props or cups.

First, an RM Young synchronous motor is attached to the shaft of the anemometer by using brand specific coupling devices. The sensor shaft is rotated at several different known revolutions per minute (rpm). Each rotational speed in rpm is equated to a wind speed in meters per second (m/s) by using the anemometer manufacturer's linear calibration formula. The difference between the calculated input speed in m/s and the datalogger output is compared to established PSD limits for each input rpm.

Next, a high precision torque watch is attached to the shaft of the anemometer, once again using custom couplings. Torque readings are made in both directions in each quadrant along the axis of rotation of the shaft. The maximum reading is recorded for the torque required to turn the shaft of the anemometer. The torque value recorded

during the audit is compared to manufacturer's torque corresponding to the minimum PSD threshold speed of 0.5m/s.

3.1.4 Wind Direction

The wind direction sensors are first audited as-found to determine the accuracy of their alignment with respect to true north (true azimuth alignment) using one of four methods. In one method, a handheld GPS unit is used to measure the position of the auditor with respect to a waypoint captured under the wind sensor's position on the tower. Using binoculars, the tail of the wind vane is aligned with the auditor's position at a distance of several hundred feet from the tower. The GPS bearing back to the tower waypoint is then compared to the DAS reading. The difference between the two should not exceed ±5° per audit point. This procedure is repeated at least 4 times, once per quadrant, generally near the cardinal directions. The second method uses a calibrated precision compass mounted on a gimbal and tripod. The compass declination is preset for the specific location and date using one of a variety of magnetic declination computer models. The sensor tail is aligned toward the auditor while auditor sights the compass toward the sensor and readings are taken in a similar manner to the GPS method.

Another option is to align the tail of the sensor with a distant identifiable landmark of know bearing. The bearing to the landmark may be ascertained using a variety of methods. One method involves physically capturing a distant GPS waypoint, such as at a discernable structure or emissions stack. Bearings to inaccessible natural landmarks, usually distant mountain peaks, are acquired through the use of various computer mapping programs, such as Natural Geographic's TOPO program or USGS digital raster graphics (DRGs) loaded into AutoCAD. The bearing from the station location to the landmark is compared to the DAS reading. This method yields the most accurate audit value, but is limited by weather and availability of discernable landmarks. The final method is to align the vane with the tower guy wires or preset survey markers, whose bearing has been ascertained using precision survey equipment.

The wind direction accuracy and linearity are subsequently audited after the wind direction sensor is removed from the tower. The Climatronics sensor is mounted on a Climatronics Model 101984 linearity tester and the RM Young sensor is mounted on an RM Young Model 18112 Vane Angle Bench Stand. Both test fixtures are keyed to their respective sensor and graduated from 0° to 360°. A series of readings starting at 30° and then clockwise in 30° increments are taken. The RM Young is read from 30° to 360° and the Climatronics is read from 30° to 540°. The Climatronics sensor is tested 180° past 360° in order to test the second potentiometer used in some DAS

programming. Although not required, the Climatronics sensor is also tested with the vane attached in order to ascertain sensor accuracy and linearity relative to the instrument crossarm. The vane is aligned along the axis of the crossarm to yield the 0°/360° and 180° values and against a square held to the crossarm for the 90° and 270° directions. Four readings are taken in a clockwise direction and four are taken counterclockwise to complete the test. For both the linearity test fixture and crossarm tests, individual error values are assessed for the PSD accuracy limit of ±5° per point and the mean absolute average error is assessed against the linearity limit of 3°.

Next, the RM Young wind direction threshold is tested by measuring wind vane torque using an RM Young Model 18331 Vane Torque Gauge. This device saddles the wind vane and a calibrated spring is pulled to determine maximum torque from readings taken in both directions in all four quadrants. The Climatronics wind direction starting torque is measured with the vane removed by using a precision torque watch in the same manner as the wind speed torque. The highest torque readings are compared to specific manufacturer limits for instrument staring torque.

Finally, the wind direction sensors are placed back on the tower and as-left audits of the azimuth alignments are conducted to ensure the instruments are properly reinstalled.

3.1.5 Relative Humidity

Relative humidity (RH) is audited using a collocated NIST traceable RH sensor. The NIST sensor and the field sensor are collocated out of direct sunlight to eliminate solar radiation effects, preferably inside of the motor aspirated shield. If the NIST standard reads directly in dew point °C, those readings are used; if not, relative humidity and temperature readings are used. For the audit, instantaneous readings of dew point, relative humidity and temperature are recorded from the transfer standard and the DAS. All relative humidity and temperature readings are converted to dew point in order to assess the PSD error limit of ±1.5°C dew point.

3.1.6 Barometric Pressure

Barometric pressure (BP) is audited using a collocated NIST traceable BP sensor. The difference between the NIST sensor and the station sensor are compared to the PSD limit of ±3 mbar.

3.1.7 Solar Radiation

Outputs of the station sensor are compared to the output of a level collocated audit solar radiation sensor. The audit sensor is connected to an independent audit datalogger with the scan interval and clock synchronized with the station DAS. Hourly

average solar radiation readings and instantaneous readings are recorded during the audit and then input into a custom spreadsheet to calculate a linear regression for the data. The PSD limit for solar radiation audits is ±5% of observed, but this standard is very difficult to obtain at the northern latitude of this installation. This EPA standard is currently undergoing review and is expected to change. A well excepted substitute is that individual DAS and audit data pairs are compared to a limit of ±5% of observed **+ EPA minimum instrument resolution (10W/m²)**. Individual data pairs are evaluated against this standard, but the overall set is restricted to a 5% error by limiting allowable linear slope to 1.0±0.05.

3.2 Performance Audit Results

The initial performance audit was conducted at the Pebble Port Station on June 25, 2005, shortly after startup. Steve Mackey and Jared Cockman of HCG and Robert Parks of NDM assisted. The relative humidity sensor and barometric pressure sensor were audited on July 19, 2005 because the transfer standards were not available in June. All sensors, except the solar radiation sensor, were challenged with certified audit equipment and yielded errors below the PSD limits. The solar radiation audit was not completed because adequate audit equipment was not available at the time of the audit. Summary audit results are contained in Table 3-2 and complete audit reports and audit equipment calibration certificates are contained in Appendix B and Appendix C respectively.

3.3 Performance Audit Recommendations

- None.

Table 3-2 Port Station June 25, 2005 & July 2005 Performance Audit Summary

Parameter	Limit	Units	Max Err	Status
Datalogger Time	≤ ±5:00	Min:Sec	0:02	Pass
2-m Temperature Accuracy	≤ ±0.5	°C	0.35	Pass
10-m Temperature Accuracy	≤ ±0.5	°C	0.30	Pass
Air Temperature Difference	≤ ±0.1	°C	-0.05	Pass
Climatronics Wind System				
Wind Speed Torque	≤ 0.0049	oz-in	<<0.003	Pass
Low Wind Spd. Accuracy (≤5m/s)	≤ ±0.2	m/s	0.00	Pass
High Wind Spd. Accuracy (>5m/s)	≤ ±5	% input	0.0	Pass

1.0 GENERAL PROGRAM INFORMATION

1.1 Site Description

The Pebble Port tower is located near the middle of a small point on the west shore of Iniskin Bay. The 50' high point is approximately 75' wide and 150' long and is vegetated with Alders, low shrubs and small Spruce trees. East of the station are the waters of Iniskin Bay and to the west the topography rises steeply to almost 3,000'.

1.2 Site Location

1.2.1 Coordinates

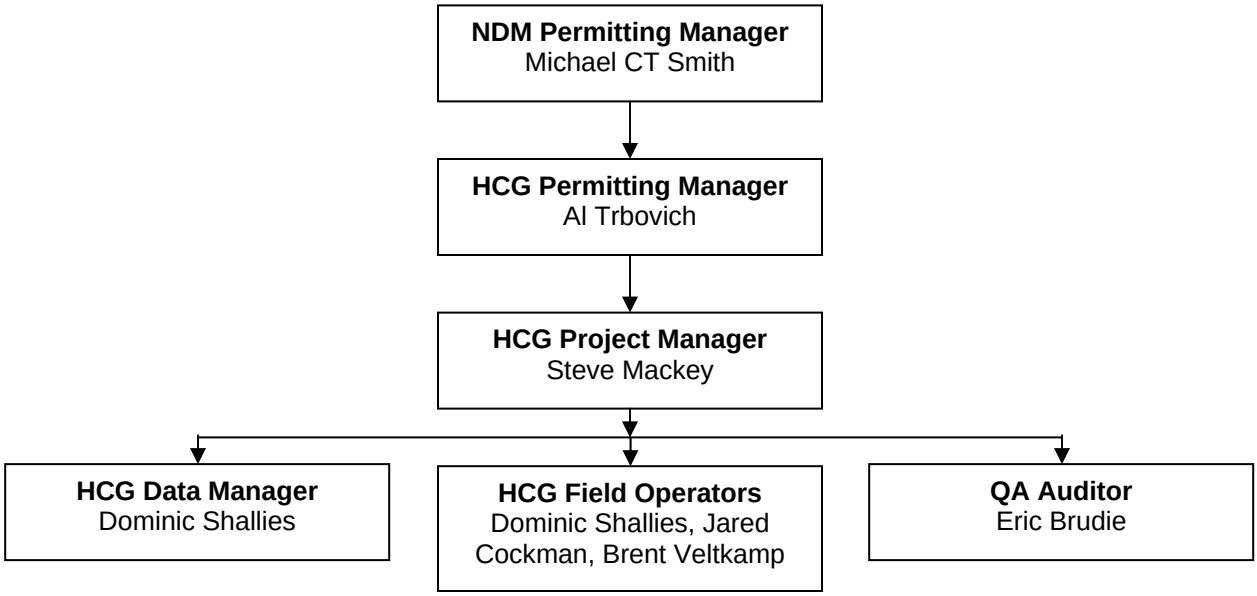
Indicated by Operator	Determined by Auditor
59° 39' N	59° 38.959' N
153° 28' W	153° 28.314' W
Elevation: 40 feet	Elevation: 50 feet

1.2.2 Appearance and Safety

Does the site appear clean, organized and well maintained?	■ Yes □ No	Comments: None.
Does the site appear to be safe and reasonably hazard free?	■ Yes □ No	Comments: None.
Does the site have a shelter for operators?	■ Yes □ No	Comments: None.
Does the site have emergency equipment such as a first aid kit available?	■ Yes □ No	Comments: None.
Does the site have adequate measures to prevent human tampering?	■ Yes □ No	Comments: 6' fence surrounds station.
Does the site have adequate measures to prevent damage from animals?	■ Yes □ No	Comments: Cables protected in liquid-tight conduit and electronics inside shelter.

2.0 MONITORING PROGRAM STAFF ORGANIZATION

- Draw diagram indicating the organizational structure of the monitoring program. Include names and titles:



3.0 METEOROLOGICAL MONITORING STATION EQUIPMENT

3.1 Inventory

Parameter	Make	Model	Serial No.
DAS	Campbell Scientific	CR10X	X41611
DAS Wiring Panel	Campbell Scientific	CR10X	31375
Temperature (2-meter)	Met One	062MP	E3381, ID #1/2
Temperature (10-meter)	Met One	062MP	E3381, ID #2/2
Temperature Aspirators	Met One	076B-4	Unknown
Primary Wind Speed	Climatronics	F460-100075	5008
Primary Wind Speed Cups	Climatronics	HD Al. P/N 101287	2285
Primary Wind Direction	Climatronics	F460-100076	4690
Primary Wind Direction Vane	Climatronics	HD P/N 101288	1425
Wind Sigma	Campbell Scientific	DAS Calculated	N/A
Backup Wind Speed	RM Young	05305 Wind Mon-AQ	67055
Backup Wind Speed Prop	RM Young	08254	63037
Backup Wind Direction	RM Young	05305 Wind Mon-AQ	67055
Relative Humidity	Vaisala	HMP45AC	A2120081
Barometric Pressure	Vaisala	PTB101B	A1950006
Solar Radiation	LI-COR	Li-200SX	PY50763

3.2 Equipment Evaluation

3.2.1 Data Acquisition System (DAS) and Communications System

Is the DAS well protected from the elements with adequate room for maintenance?	■ Yes □ No	Comments: DAS inside of a weatherproof building, mounted on a 4'x4' wiring panel.
Is the DAS rated for operation in the expected local temperature range?	■ Yes □ No	Comments: -55°C to + 85°C.
Are all sensor cables neatly and securely connected to the correct DAS channels?	■ Yes □ No	Comments: Well organized wiring panel.
Is remote communication to the DAS system available to operators?	■ Yes □ No	Comments: DAS to SC932A interface to FreeWave RF network to SixNet modem.
Are all components of the DAS and communications system operational?	■ Yes □ No	Comments: None.
Are the DAS and communication equipment properly grounded?	■ Yes □ No	Comments: 8' ground rod wired to central ground buss.
Are the DAS and communication equipment protected from lightning?	□ Yes ■ No	Comments: There is no lighting protection, but area not prone to strikes.

3.2.2 Power Supply System

Does the system have a stable power supply or line power?	■ Yes □ No	Comments: Very robust alternative power supply described below.

- Describe the meteorological monitoring station power supply system.

The DAS, communications equipment and meteorological sensors are powered by one 50-Watt solar panel, buffered through two 200 amp-hr deep cycle gel cell batteries. The aspirator fans and Climatronics wind sensor heaters are powered by three 50-Watt solar panels buffered through two 200 amp-hr deep cycle gel cell batteries. During the winter months (November through April), the aspirator/heater system is also powered by a 21-Watt propane Thermo-Electric Generator (TEG). The isolated DAS and Aspirator power systems can be interconnected during upset conditions through an array of relays managed through the DAS control ports. The DAS monitors battery levels and can shunt the two power systems should one run low. The DAS also has algorithms programmed to assess weather conditions and limit heater use when not required.

3.2.3 Meteorological Monitoring Sensors

Do all sensors appear to be clean, intact, in good condition and well maintained?	■ Yes □ No	Comments: None.
Are all sensors operational, online and reporting data?	■ Yes □ No	Comments: None.
Do all sensors meet EPA criteria for PSD quality sensors?	■ Yes □ No	Comments: See table below.
Are spare parts stocked for items which are frequently worn out or broken?	■ Yes □ No	Comments: Spare props, cups and vanes onsite and spare bearings at HCG office.

3.2.4 EPA PSD Meteorological Instrument Standards

Parameter	Instrument Specifications	EPA Standard	Pass?
Air Temperature (2-M, 10-M & Delta-T) – Met One Mdl. 062MP			
Accuracy (2-m & 10-m):	±0.05 °C	±0.5 °C	Yes
Accuracy (Delta-T):	±0.02 °C	±0.1 °C	Yes
Range (Operating Temp):	-50°C to +50°C	-20°C to +30°C	Yes
*Resol. (2-m & 10-m):	0.01°C	0.1°C	Yes
*Resolution (Delta-T):	0.01°C	0.02°C	Yes
Response Time:	10 seconds	≤1 minute	Yes
Wind Speed – Climatronics Mdl. F460-100075			
Accuracy:	±0.07 m/s or ±1% of obs.	±0.2 m/s + 5% of observed	Yes
Range:	0.0 m/s to 65 m/s	0.5 m/s to 50 m/s	Yes
*Resolution:	0.01m/s	0.1 m/s	Yes
Threshold Speed:	0.22 m/s	≤0.5 m/s	Yes
Distance Constant:	<4.0 m (HD Alum. Cups)	≤5 m	Yes
Operating Temperatures:	-40°C to +60°C	-30°C to + 30°C	Yes
Wind Direction – Climatronics Mdl. F460-100076			
Accuracy:	±2°	±5°	Yes
Range:	0° to 360°	0° to 360°	Yes
*Resolution:	0.1°	1°	Yes
Threshold Speed:	0.22 m/s	≤0.5 m/s	Yes
Distance Constant:	<2.5 m (Heavy Duty Vane)	≤5 m	Yes
Damping Ratio:	>0.4 @10° initial angle	0.4 to 0.7	Yes
Operating Temperatures:	-50°C to +60°C	-30°C to + 30°C	Yes
Wind Speed – RM Young Mdl. 05305 Wind Monitor-AQ			
Accuracy:	±0.2 m/s or 1% of observed	±0.2 m/s + 5% of observed	Yes
Range:	0.0 m/s to 50 m/s	0.5 m/s to 50 m/s	Yes
*Resolution:	0.01m/s	0.1 m/s	Yes
Threshold Speed:	0.4 m/s	≤0.5 m/s	Yes
Distance Constant:	2.1 m	≤5 m	Yes
Operating Temperatures:	-50°C to +50°C	-30°C to + 30°C	Yes
Wind Direction – RM Young Mdl. 05305 Wind Monitor-AQ			
Accuracy:	±3°	±5°	Yes
Range:	0° to 360°	0° to 360°	Yes
*Resolution:	0.1°	1°	Yes
Threshold Speed:	0.5 m/s @10° displacement	≤0.5 m/s	Yes
Distance Constant:	1.2 m	≤5 m	Yes
Damping Ratio:	0.45	0.4 to 0.7	Yes
Operating Temperatures:	-50°C to +50°C	-30°C to + 30°C	Yes
Relative Humidity – Vaisala Mdl. HMP45AC			
Accuracy:	±2/3% at 0-90/90-100% RH	±1.5°C Dew Point**	Yes
Range:	0.8% to 100% RH	-30°C to +30°C Dew Point**	Yes
*Resolution:	0.1% RH	1% RH	Yes
Response Time:	10 sec	≤30 minutes	Yes
Operating Temperatures:	-40°C to +60°C	-30°C to + 30°C	Yes
** EPA criteria in units of dew point, RH and operating temperature ranges meet these criteria.			
Barometric Pressure – Vaisala Mdl. PTB101B			
Accuracy:	±0.5 mbar	±3 mbar	Yes
Range:	600 mbar to 1060 mbar	Not Specified	N/A
*Resolution:	0.1 mbar	0.5 mbar	Yes
Response Time:	300 msec	Not Specified	N/A
Operating Temperatures:	-40°C to +60°C	Not Specified	N/A

EPA Recommended Meteorological Instrument Standards (Continued)

Parameter	Instrument Specifications	EPA Standard	Pass?
Solar Radiation – LI-COR Mdl. Li-200SX Pyranometer			
Accuracy:	±5% Observed	±5% Observed	Yes
Range:	0 W/m^2 to 3000 W/m^2	Not Specified	N/A
*Resolution:	1 W/m^2	10 W/m^2	Yes
Response Time:	10 µs	5 seconds	Yes
Spectral Response:	400 nm to 1,100 nm	285 nm to 2800 nm	No
Operating Temperatures:	-40°C to +65°C	-20°C to +40°C	Yes
* For all instruments; resolutions are the result of instrument type, configuration and DAS programming.			

3.3 Station Location and Siting

3.3.1 Tower

Do all obstructions exist below a 1:10 slope away from the tower base? ■ Yes □ No Comments: None.

Is the height of the tower 10 meters above the ground? ■ Yes □ No Comments: None.

Is the tower stable and plumb? ■ Yes □ No Comments: None.

Is the tower protected from lightning? □ Yes ■ No Comments: There is no lighting protection, but area not prone to strikes.

3.3.2 Temperature and Relative Humidity Sensors

Are the sensors mounted at least 2-m above open level ground at least 9-m in diameter? ■ Yes □ No Comments: None.

Are the temperature difference probes at heights of 2-m and 10-m above the ground? ■ Yes □ No Comments: None.

Are the sensors at a distance greater than four times the height of any obstruction? ■ Yes □ No Comments: None.

Is the ground beneath the temperature sensors natural native material? ■ Yes □ No Comments: None.

Is the site free of any natural features that could bias temperature data (e.g. open water, sloping ridge, etc.)? ■ Yes □ No Comments: None.

Is the site free of any man-made features that could bias temperature data (e.g. asphalt, concrete, exhaust plumes, etc.)? ■ Yes □ No Comments: None.

Are the sensors located at least 30 meters from large paved areas? ■ Yes □ No Comments: None.

Is the ambient temperature sensor protected from the influence of solar radiation? ■ Yes □ No Comments: Housed in Met One Mdl 076B-4 Motor Aspirated Radiation Shield.

Are the temperature difference sensors located in identical aspirated shields? ■ Yes □ No Comments: Housed in Met One Mdl 076B-4 Motor Aspirated Radiation Shields.

3.3.3 Wind Speed and Wind Direction Sensors

Is the horizontal distance between the instruments and any obstruction at least 10 times the height of the obstruction?	■ Yes □ No	Comments: None.
Are the instruments at least 1.5 times nearby building height(s) above the building roof(s), or 10-m high?	■ Yes □ No	Comments: None.
Are the wind speed and wind direction sensors stable and plumb?	■ Yes □ No	Comments: None.
Is the distance of the sensor on the cross-arm at least twice the diameter of the tower?	■ Yes □ No	Comments: Climatronics Sensors mounted on a crossarm which meets this criterion.
Is the distance of the sensor on the cross-arm at least twice the diameter of the tower?	■ Yes □ No	Comments: RM Young sensor mounted on an extension arm which meets this criterion.
Is the wind direction sigma theta data being collected according to EPA requirements?	■ Yes □ No	Comments: DAS calculated using Yamartino method and a one-second scan interval.

3.3.4 Relative Humidity and Barometric Pressure

Is the relative humidity sensor open to the atmosphere & protected from precipitation?	■ Yes □ No	Comments: Housed in 2-m aspirated shield with temperature sensor.
Is the barometric pressure sensor open to atmosphere & protected from precipitation?	■ Yes □ No	Comments: Housed in unsealed shelter, mounted on wiring panel.

3.3.5 Solar Radiation

Is the instrument situated above the plane of any obstructions that could cast shadows?	■ Yes □ No	Comments: None.
Is the sensor situated south of the tower to minimize obstruction from the tower?	■ Yes □ No	Comments: None.

4.0 STANDARD OPERATING PROCEDURES

4.1 General

Is the station visited on a preset schedule?	■ Yes □ No	Comments: None.
Have standard SOPs been developed, and are they being followed by the operators?	■ Yes □ No	Comments: None.
Does the operator follow a preventative maintenance schedule?	■ Yes □ No	Comments: None.
Are site visits and maintenance activities properly documented in a Station Log?	■ Yes □ No	Comments: Site visit memos are compiled.
Are station operators knowledgeable and competent regarding effective operation?	■ Yes □ No	Comments: None.
Have operators attended any formal training for operating met monitoring stations?	□ Yes ■ No	Comments: All operators have one to two years onsite experience.

Are copies of the NIST certifications for the calibration equipment made available?	■ Yes □ No	Comments: Attached.

4.2 DAS and Meteorological Sensors

Are regular multipoint QC checks performed on the DAS?	■ Yes □ No	Comments: DAS audited by virtue of the instrument output values.
Are regular multipoint QC checks performed on the meteorological sensors?	■ Yes □ No	Comments: None.
Are the sensors visually inspected for defects and problems?	■ Yes □ No	Comments: None.
Are ambient conditions compared with sensor readings from the DAS?	■ Yes □ No	Comments: DAS output compared to Iliamna Airport weather station.
Are data frequently reviewed for reasonableness and completeness?	■ Yes □ No	Comments: None.
Is a copy of the datalogger program made available for review?	■ Yes □ No	Comments: None.

5.0 DOCUMENTATION

5.1 System Reference and Maintenance Manuals

Does the operator have all required DAS and meteorological instrument manuals?	■ Yes □ No	Comments: On-site and at HCG offices.
Does the operator have configuration and wiring schematics specific to the station?	■ Yes □ No	Comments: Operator carries wiring schematics.

5.2 Station Monitoring Plan and Report Forms

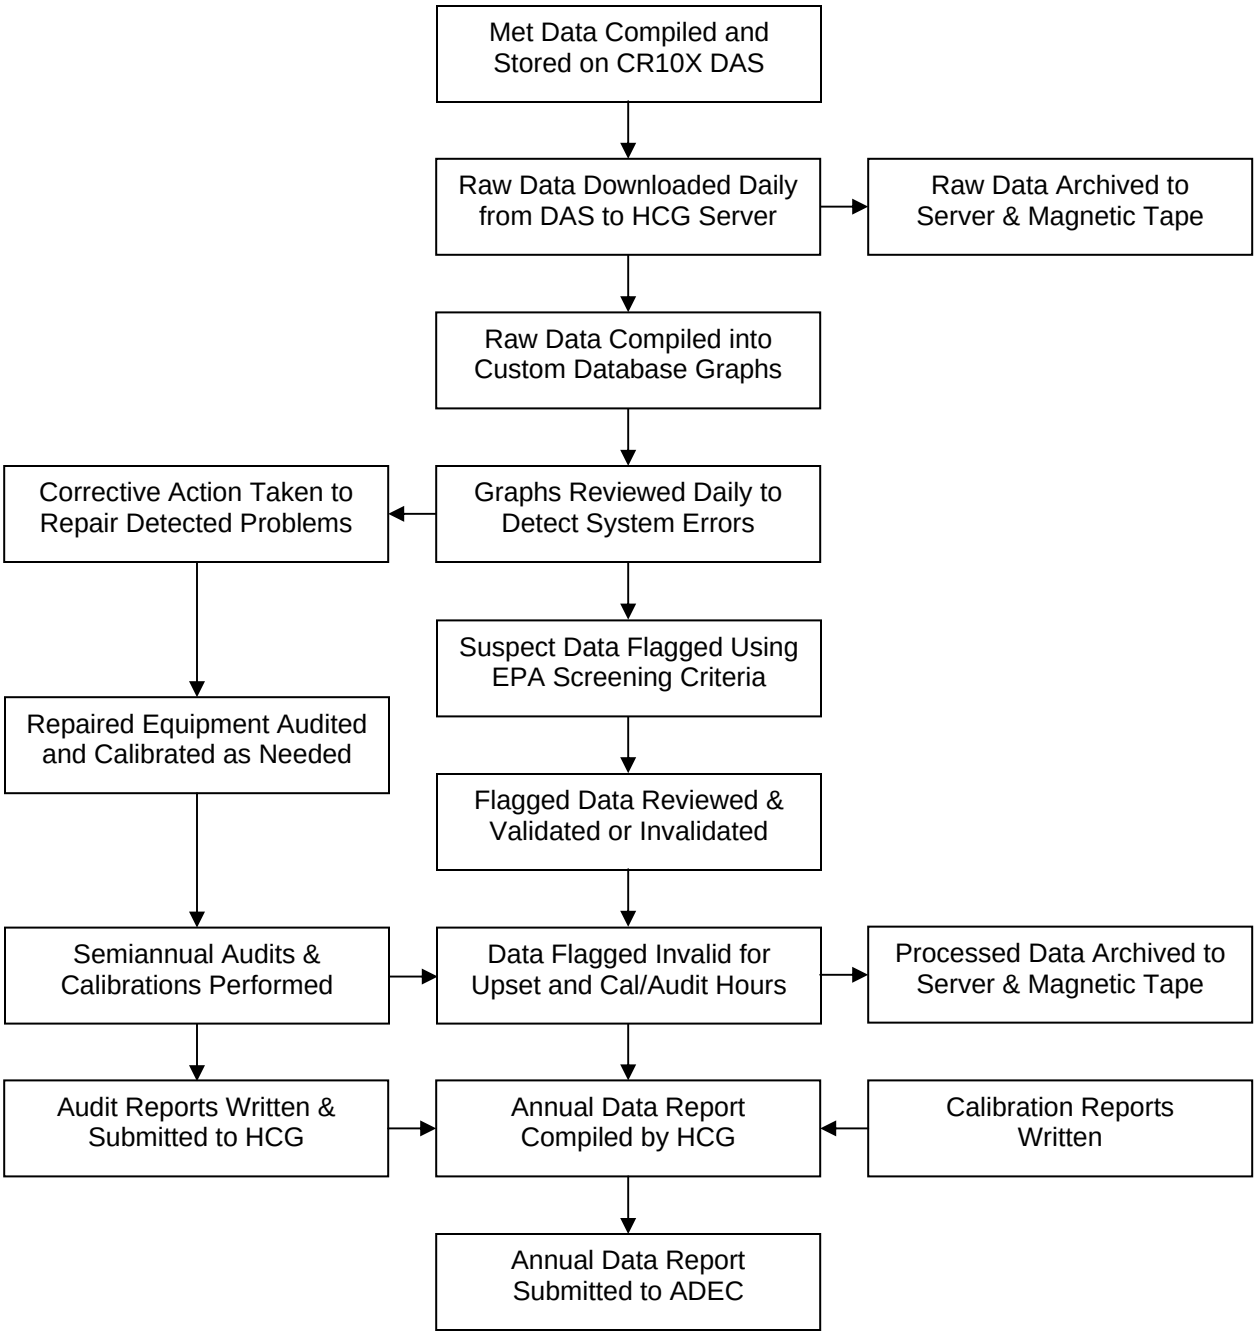
Is the Monitoring/QA plan comprehensive and reflective of the actual installation?	■ Yes □ No	Comments: None.
Does the Monitoring/QA plan indicate the intended use for the data collected during the monitoring program?	■ Yes □ No	Comments: Collect PSD quality data to meet dispersion modeling requirements and satisfy mine/transportation design requirements.
Does the system outlined in the QA plan meet the objectives outlined above?	■ Yes □ No	Comments: PSD quality installation.
Does the QA Plan indicate the intended schedule for reports to be submitted?	■ Yes □ No	Comments: None.
Does the station have an activity log?	□ Yes ■ No	Comments: Site visit memos written after each visit to supplant a log book.
Does the station have a formal Site Visit and Checklist Form?	□ Yes ■ No	Comments: No formal checklist used.
Does the station have an adequate Operations Manual?	■ Yes □ No	Comments: Monitoring/QA plan and equipment manuals.

Does the station have an adequate Calibration Report Form and copies of previous calibrations and audits?	■ Yes □ No	Comments: None.
Are report forms and site logs properly completed and current?	■ Yes □ No	Comments: None.

6.0 DATA PROCESSING and VALIDATAION

6.1 Overall Data Management

- Diagram the flow of data from monitoring equipment to submission of a final report.



6.2 Data Collection and Initial Data Review

Is the station polled and data downloaded on a regular basis?	■ Yes □ No	Comments: Daily via RF modem and telephony modem.
Are the monitoring station data reviewed on a regular basis?	■ Yes □ No	Comments: Data imported into custom graphs and reviewed 5-6 days per week.
Are the monitoring station data screened on a regular basis?	■ Yes □ No	Comments: Data screened using EPA criteria prior to summary compilations.
Are procedures in place for backing up raw data?	■ Yes □ No	Comments: Raw data files are backed up on the HCG server and on magnetic tape.
Are written procedures for data handling available for the project?	■ Yes □ No	Comments: None.

- Describe the data polling process and initial data evaluation.

Data is downloaded from the station on a daily basis using a dedicated data polling computer located at the HCG office. The raw *.dat file is appended to the existing raw station data file located on the HCG server, which is backed up to tape daily. The raw data are copied to an Access/Excel database file which generates custom graphs of the various meteorological and operational parameters. These graphs are reviewed 5-6 days per week in order to identify station problems. This graphical data review is the frontline of maintaining a complete and defensible dataset. Station upsets are instantly identified and repaired within days. Copies of both the raw unadjusted data and the custom database files are retained for a minimum of 5 years.

6.3 Corrective Actions

Are procedures established for initiating corrective actions during data processing?	■ Yes □ No	Comments: Daily graphical data review and subsequent reactions.

- Describe procedures for initiating, tracking and closing corrective actions.

When nonconformance issues are recognized during graphical review, the Lead Operator/Data Manager plans and executes corrective action. A calibration check is performed on any sensor which is repaired or replaced during the action. A site visit memo outlining the nature of the problem and repairs undertaken is written and saved to the station file. Any quantifiable error is also documented for possible data validation. The Operator/Data Manager ensures the erroneous data are flagged for the period from initial noncompliance until repair and calibration.

6.4 Data Validation

Are data validation procedures established and in use?	■ Yes □ No	Comments: None.
Are adjusted and unadjusted data sets maintained?	■ Yes □ No	Comments: Both are backed up on the HCG server and magnetic tape.

- Describe the initial data validation procedure.

Data is compiled in a custom Excel spreadsheet programmed to evaluate meteorological data against EPA recommended PSD data screening criteria. The data are screened for events such as; extended periods of zero wind speed (indicating icing or worn bearings), temperatures outside of the known monthly max/min for the area, etc. Nonconforming data are flagged by the screening program for further investigation. Also, data periods for individual parameters are flagged for times when the corresponding instrument was undergoing field servicing, calibrations or audits. Periods when instruments are known to have been out of calibration or malfunctioning are also flagged.

- Describe procedures for validating and invalidating flagged data (outliers).

Data flagged during the screening process described above are manually reviewed. If the data have a quantifiable, consistent and documented bias, they may be adjusted and then validated. Specific guidelines are detailed in the Plan. Data which have been flagged by the screening program are also compared to local weather conditions as determined from other sources. Examples where data flagged during screening may be validated include periods when winds were known to have been exceptionally calm at nearby stations or extreme temperatures outside the historical max/min were witnessed. At this point, flagged data are permanently validated and left in the database or invalidated and removed from the database. Data removed from the database are replaced with an alphanumeric code to indicate the reason for invalidation.

- Identify those responsible for data validation.

Name: Dominic Shallies
Position: Lead Operator & Data Manager
Affiliation: Hoefler Consulting Group, Inc.

Name: Isaac Bertschi
Position: Data Management
Affiliation: Hoefler Consulting Group, Inc.

6.5 Data Capture

- Identify the desired data capture rate for the monitoring data.

Target rate for PSD Quality Meteorological Monitoring Data is 90%.

Is the desired data capture rate being met for each data type?	■ Yes □ No	Comments: None.

6.6 Data Reporting

Are quarterly and annual data reports being submitted for the site?	■ Yes □ No	Comments: None
Are qualified staff personnel reviewing data reports prior to submittal?	■ Yes □ No	Comments: None.
Is finalized data set submitted with report to ADEC?	■ Yes □ No	Comments: None.

7.0 QUALITY ASSURANCE AND QUALITY CONTROL

7.1 Quality Assurance Program

Has a quality assurance plan been written describing quality assurance procedures?	■ Yes □ No	Comments: None.
Is a copy of the plan available to field and data processing personnel?	■ Yes □ No	Comments: None.
Has the quality assurance plan been approved by the ADEC?	■ Yes □ No	Comments: None.

- Identify those person(s) responsible for updating the plan SOPs.

Name: Steve Mackey
Position: Project Manager
Affiliation: Hoefler Consulting Group, Inc.

7.2 Quality Assurance Methods and Audits

Have adequate audit procedures been identified within the quality assurance plan?	■ Yes □ No	Comments: None.
Does the Plan correctly document PSD accuracy limits for calibrating and auditing?	■ Yes □ No	Comments: None.
Have audits been conducted on the suggested schedule of every six months?	■ Yes □ No	Comments: None.

- Identify the person(s) responsible for conducting audits on the monitoring instrumentation.

Name: Eric Brudie
Position: Field Auditor
Affiliation: Hoefler Consulting Group, Inc.

8.0 COMMENTS AND SUGGESTIONS

- Prepare and compile site specific station checklists and visit forms.

APPENDIX B
PERFORMANCE AUDIT DATA SHEETS and ALIGNMENT MAP

METEOROLOGICAL STATION - INSTRUMENT PERFORMANCE AUDIT (11-M)

Owner: Northern Dynasty **Operator:** Dominic Shallies **Alternate:** Steve Mackey **Station Site:** Port
Auditor: Eric Brudie **Witness(s):** Steve Mackey, Jared Cockman, Robert Park **Audit Date:** 25-Jun-05

● *DAS TIME AUDIT*

PSD Limits: DAS time = Alaska Standard Time (AST) +/- 5 minutes.
Conversions: Winter; (AST) = (DST), Summer; (AST) = (DST) - 1 hr.
Comments: None.

DAS TIME vs. NOAA CLOCK			
AST Time	DAS Time	Error Min:Sec	Pass/ Fail?
15:05:00	15:05:02	**00:02**	**PASS**

This Instrument was calibrated using Instruments Traceable to National Institute of Standards and Technology.

A Test Uncertainty Ratio of at least 4:1 is maintained unless otherwise stated and is calculated using the expanded measurement uncertainty. Uncertainty evaluation includes the instrument under test and is calculated in accordance with the ISO "Guide to the Expression of Uncertainty in Measurement" (GUM). The uncertainty represents an expanded uncertainty using a coverage factor k=2 to approximate a 95% confidence level. In tolerance conditions are based on test results falling within specified limits with no reduction by the uncertainty of the measurement. The results contained herein relate only to the item calibrated. This certificate shall not be reproduced except in full.

Wallace Berry

Wallace Berry, Technical Manager

Maintaining Accuracy:

In our opinion once calibrated your Digital Thermometer should maintain its accuracy. There is no exact way to determine how long calibration will be maintained. Digital Thermometers change little, if any at all, but can be affected by aging, temperature, shock, and contamination.

Recalibration:

For factory calibration and re-certification traceable to National Institute of Standards and Technology contact Control Company.

Report #: 101705-X0740015-RH **RMA #:** 95-49728 **Calibration Date:** Oct-17-2005
Model #: HMI41/HMP45 **Serial #:** X0650080 / X0740015
Instrument Type: Humidity Transmitter Calibration Procedure: 11603100
Instrument Range: 0 to 100%RH Recommended Calibration Due Date: Oct-17-2006

Customer: HOEFLER CONSULTING GROUP
City, State: ANCHORAGE, AK

This unit was calibrated by adjusting its reading at 0%* against a dry-air line and at 75% against reference humidity and temperature instrument, Vaisala model HMP233. Additional instrument verification checkpoints were made against HMP233 reference at 11%RH, 33%RH and 97%* RH. Calibration and instrument verification sequences utilize a dry-air line and a set of controlled aqueous salt solutions Vaisala model HMK13B. Laboratory ambient conditions are humidity and temperature controlled. The calibration uncertainty is presented at 95% confidence level, k=2. The standard uncertainty of the measurement has been determined in accordance with U.S. Guide to the Expression of Uncertainty in Measurement. *Note: the 0% and 97% RH points are not ISO17025 Accredited.

1.0 INTRODUCTION

Hoefler Consulting Group, Inc. (HCG) operates meteorological monitoring stations for Northern Dynasty Mines, Inc. (NDM) in support of the Pebble Mine Project near Iliamna, Alaska. The air monitoring program is one component of ongoing baseline environmental studies being conducted to support mine permitting, mine design and mine transportation infrastructure development. The stations meet Prevention of Significant Deterioration (PSD) guidelines, although PSD permits may not be required. This report covers the Port monitoring station located near the proposed mine port site.

The Pebble Port Station is located on the west shore of Iniskin Bay, near the southern end of the bay. The station is situated on a 50' high knoll, very near the water's edge. The Port Station consists of an instrumented 11-meter sectional tower secured with three guy wires. Approximately 20' south of the tower is a 6' by 8' insulated building which houses the datalogger and power supply system. The Pebble Port Station is instrumented with PSD quality sensors monitoring the following parameters:

- Ambient Temperature (ºC): Met One 062MP Thermistor Probe at 2-m
- Temperature Difference (ºC): Met One 062MP Thermistors at 2-m and 10-m
- Wind Speed 1 (m/s): Climatronics F460 P/N 100075 Wind Speed Sensor
- Wind Direction 1 (°): Climatronics F460 P/N 100076 Wind Direction Sensor
- Wind Speed 2 (m/s): RM Young 05305 Wind Monitor-AQ
- Wind Direction 2 (°): RM Young 05305 Wind Monitor-AQ
- Sigma Theta (°): Campbell Scientific CR10X DAS calculated (Yamartino)
- Relative Humidity (%RH): Vaisala HMP45AC Relative Humidity Sensor
- Barometric Pressure (mbar): Vaisala PT101B Barometric Pressure Sensor
- Solar Radiation (W/m2): LI-COR Li-200SX Solar Radiation Pyranometer.

This report has been prepared for NDM to serve as a quantitative review of the Pebble Port Station. To that end, a Performance Audit was undertaken in order to demonstrate that the equipment installed at the meteorological monitoring station is operating correctly and meets the requirements set forth by the U.S. Environmental Protection Agency (EPA) and the Alaska Department of Environmental Conservation (ADEC).

2.0 PERFORMANCE AUDIT

2.1 Performance Audit Methodology

During the performance audit, the station datalogger is interfaced with a portable laptop computer to display the outputs for the meteorological sensors. The value of each meteorological sensor is compared to the output value from the appropriate piece of audit equipment or from calibrated instruments collocated with the sensor. The difference between the station's datalogger reading and the output from each audit instrument is compared with established PSD limits to determine the accuracy of each sensor. Additionally, threshold torques for wind speed and wind direction are measured with audit equipment and compared with manufacturer torques corresponding to the PSD threshold speed of 0.5 m/s. Table 2-1 provides a summary of the performance audit methods and limits used to audit each parameter at the stations.

Table 2-1 Performance Audit Methods and Acceptable Limits

Parameter	Audit Method	EPA/Manufacturer Limit
Datalogger Time	NOAA Clock	≤ ±5:00 minutes from AST
Temperature Accuracy	Collocated NIST thermistor	≤ ±0.5 °C
Temperature Difference	Collocated NIST thermistor	≤ ±0.1 °C
Wind Speed Accuracy	Synchronous rpm motor	≤ ±0.2 m/s + 5 % observed
Wind Spd Torque (Clim)	Torque watch	≤ 0.35 g-cm (0.0049 oz-in)
Wind Spd Torque (RMY)	Torque watch	≤ 1.0 g-cm (0.014 oz-in)
Wind Direction Alignment	GPS, compass or landmark	≤ ±5° from true azimuth
Wind Direction Accuracy	Linearity tester	≤ ±5° per audit point
Wind Direction Linearity	Linearity tester	≤ 3° mean absolute average
Wind Dir Torque (Clim)	Torque watch	≤ 7.5 g-cm (0.104 oz-in)
Wind Dir Torque (RMY)	Vane torque gauge	≤ 11 g-cm (0.153 oz-in)
Relative Humidity	Collocated NIST RH sensor	≤ ±1.5 °C of dew point
Barometric Pressure	Collocated NIST BP sensor	≤ ±3 mbar
Solar Radiation[1]	Collocated NIST sensor	≤ ±5% of input+resolutuion[2]

1. Solar radiation not audited.
2. This audit limit is modified from PSD standard, as discussed below.

2.1.1 Data Acquisition System

An audit of the datalogger is conducted by comparing all datalogger outputs to the audit standards, as described below. The datalogger time is checked against an instantaneous time reading from the National Oceanic and Atmospheric Administration (NOAA) clock in Boulder, Colorado, via a global positioning system (GPS) handheld unit or telephone contact with the NOAA clock.

2.1.2 Air Temperature and Air Temperature Difference

The 2-meter and 10-meter thermistors are removed from their aspirator shields and collocated with a National Institute of Standards and Technology (NIST) traceable digital thermometer. The station thermistors and the transfer standard NIST thermometer are taped together and immersed in insulated thermoses containing a series of water baths; hot water (35°C to 45°C), warm water (15°C to 25°C), and a water/ice bath (0°C). Each water bath is agitated and allowed to equilibrate before simultaneous readings are taken from the three instruments. The difference between the individual station thermistors and the NIST standard are compared to the PSD temperature accuracy limit of ±0.5°C. The difference between the two station thermistors (10-m°C minus 2-m°C) is compared to the PSD temperature difference limit of ±0.1°C.

2.1.3 Wind Speed

Anemometers are audited to determine their accuracies in reading known wind speeds and to ascertain the sensor's threshold torque. The Climatronics and RM Young sensors are audited in very similar manners and are discussed together. The instruments are tested after removal from the tower and after removal of the sensor's props or cups.

First, an RM Young synchronous motor is attached to the shaft of the anemometer by using brand specific coupling devices. The sensor shaft is rotated at several different known revolutions per minute (rpm). Each rotational speed in rpm is equated to a wind speed in meters per second (m/s) by using the anemometer manufacturer's linear calibration formula. The difference between the calculated input speed in m/s and the datalogger output is compared to established PSD limits for each input rpm.

Next, a high precision torque watch is attached to the shaft of the anemometer, once again using custom couplings. Torque readings are made in both directions in each quadrant along the axis of rotation of the shaft. The maximum reading is recorded for the torque required to turn the shaft of the anemometer. The torque value recorded

during the audit is compared to manufacturer's torque corresponding to the minimum PSD threshold speed of 0.5m/s.

2.1.4 Wind Direction

The wind direction sensors are first audited as-found to determine the accuracy of their alignment with respect to true north (true azimuth alignment) using one of four methods. In one method, a handheld GPS unit is used to measure the position of the auditor with respect to a waypoint captured under the wind sensor's position on the tower. Using binoculars, the tail of the wind vane is aligned with the auditor's position at a distance of several hundred feet from the tower. The GPS bearing back to the tower waypoint is then compared to the DAS reading. The difference between the two should not exceed ±5° per audit point. This procedure is repeated at least 4 times, once per quadrant, generally near the cardinal directions. The second method uses a calibrated precision compass mounted on a gimbal and tripod. The compass declination is preset for the specific location and date using one of a variety of magnetic declination computer models. The sensor tail is aligned toward the auditor while auditor sights the compass toward the sensor and readings are taken in a similar manner to the GPS method.

Another option is to align the tail of the sensor with a distant identifiable landmark of know bearing. The bearing to the landmark may be ascertained using a variety of methods. One method involves physically capturing a distant GPS waypoint, such as at a discernable structure or emissions stack. Bearings to inaccessible natural landmarks, usually distant mountain peaks, are acquired through the use of various computer mapping programs, such as Natural Geographic's TOPO program or USGS digital raster graphics (DRGs) loaded into AutoCAD. The bearing from the station location to the landmark is compared to the DAS reading. This method yields the most accurate audit value, but is limited by weather and availability of discernable landmarks. The final method is to align the vane with the tower guy wires or preset survey markers, whose bearing has been ascertained using precision survey equipment.

The wind direction accuracy and linearity are subsequently audited after the wind direction sensor is removed from the tower. The Climatronics sensor is mounted on a Climatronics Model 101984 linearity tester and the RM Young sensor is mounted on an RM Young Model 18112 Vane Angle Bench Stand. Both test fixtures are keyed to their respective sensor and graduated from 0° to 360°. A series of readings starting at 30° and then clockwise in 30° increments are taken. The RM Young is read from 30° to 360° and the Climatronics is read from 30° to 540°. The Climatronics sensor is tested 180° past 360° in order to test the second potentiometer used in some DAS

programming. Although not required, the Climatronics sensor is also tested with the vane attached in order to ascertain sensor accuracy and linearity relative to the instrument crossarm. The vane is aligned along the axis of the crossarm to yield the 0°/360° and 180° values and against a square held to the crossarm for the 90° and 270° directions. Four readings are taken in a clockwise direction and four are taken counterclockwise to complete the test. For both the linearity test fixture and crossarm tests, individual error values are assessed for the PSD accuracy limit of ±5° per point and the mean absolute average error is assessed against the linearity limit of 3°.

Next, the RM Young wind direction threshold is tested by measuring wind vane torque using an RM Young Model 18331 Vane Torque Gauge. This device saddles the wind vane and a calibrated spring is pulled to determine maximum torque from readings taken in both directions in all four quadrants. The Climatronics wind direction starting torque is measured with the vane removed by using a precision torque watch in the same manner as the wind speed torque. The highest torque readings are compared to specific manufacturer limits for instrument staring torque.

Finally, the wind direction sensors are placed back on the tower and as-left audits of the azimuth alignments are conducted to ensure the instruments are properly reinstalled.

2.1.5 Relative Humidity

Relative humidity (RH) is audited using a collocated NIST traceable RH sensor. The NIST sensor and the field sensor are collocated out of direct sunlight to eliminate solar radiation effects, preferably inside of the motor aspirated shield. If the NIST standard reads directly in dew point °C, those readings are used; if not, relative humidity and temperature readings are used. For the audit, instantaneous readings of dew point, relative humidity and temperature are recorded from the transfer standard and the DAS. All relative humidity and temperature readings are converted to dew point in order to assess the PSD error limit of ±1.5°C dew point.

2.1.6 Barometric Pressure

Barometric pressure (BP) is audited using a collocated NIST traceable BP sensor. The difference between the NIST sensor and the station sensor are compared to the PSD limit of ±3 mbar.

2.1.7 Solar Radiation

Outputs of the station sensor are compared to the output of a level collocated audit solar radiation sensor. The audit sensor is connected to an independent audit datalogger with the scan interval and clock synchronized with the station DAS. Hourly

average solar radiation readings and instantaneous readings are recorded during the audit and then input into a custom spreadsheet to calculate a linear regression for the data. The PSD limit for solar radiation audits is ±5% of observed, but this standard is very difficult to obtain at the northern latitude of this installation. This EPA standard is currently undergoing review and is expected to change. A well excepted substitute is that individual DAS and audit data pairs are compared to a limit of ±5% of observed **+ EPA minimum instrument resolution (10W/m²)**. Individual data pairs are evaluated against this standard, but the overall set is restricted to a 5% error by limiting allowable linear slope to 1.0±0.05.

2.2 Performance Audit Results

The performance audit was conducted at the Pebble Port Station on January 16, 2006, with Dominic Shallies of HCG assisting. The wind sensors were also audited on February 10, 2006, after a severe storm.

On January 16, 2006 all sensors, except the solar radiation sensor, were challenged with certified audit equipment and yielded errors below the PSD limits. The solar radiation audit was not completed because adequate audit equipment was not available at the time of the audit. On February 10, 2006 the Climatronics sensor was found out of alignment due to a severe winter storm event which occurred on January 22, 2006. The operator compared Climatronics and RM Young alignment data prior to and after this storm event and corroborated this conclusion. The sensor was realigned and then re-audited. Table 2-2 contains summary data from the January 2006 audit and Table 2-3 summarizes the supplemental February 2006 tests. Complete audit reports and audit equipment calibration certificates are contained in Appendix A and Appendix B respectively.

2.3 Performance Audit Recommendations

- None.

Table 2-2 Port Station January 16, 2006 Performance Audit Summary

Parameter	Limit	Units	Max Err	Status

This Instrument was calibrated using Instruments Traceable to National Institute of Standards and Technology.

A Test Uncertainty Ratio of at least 4:1 is maintained unless otherwise stated and is calculated using the expanded measurement uncertainty. Uncertainty evaluation includes the instrument under test and is calculated in accordance with the ISO "Guide to the Expression of Uncertainty in Measurement" (GUM). The uncertainty represents an expanded uncertainty using a coverage factor k=2 to approximate a 95% confidence level. In tolerance conditions are based on test results falling within specified limits with no reduction by the uncertainty of the measurement. The results contained herein relate only to the item calibrated. This certificate shall not be reproduced except in full.

Wallace Berry

Wallace Berry, Technical Manager

Maintaining Accuracy:

In our opinion once calibrated your Digital Thermometer should maintain its accuracy. There is no exact way to determine how long calibration will be maintained. Digital Thermometers change little, if any at all, but can be affected by aging, temperature, shock, and contamination.

Recalibration:

For factory calibration and re-certification traceable to National Institute of Standards and Technology contact Control Company.

Instrument Range: 0 to 100%RH Recommended Calibration Due Date: Oct-17-2006

Customer: HOEFLER CONSULTING GROUP
City, State: ANCHORAGE, AK

This unit was calibrated by adjusting its reading at 0%* against a dry-air line and at 75% against reference humidity and temperature instrument, Vaisala model HMP233. Additional instrument verification checkpoints were made against HMP233 reference at 11%RH, 33%RH and 97%* RH. Calibration and instrument verification sequences utilize a dry-air line and a set of controlled aqueous salt solutions Vaisala model HMK13B. Laboratory ambient conditions are humidity and temperature controlled. The calibration uncertainty is presented at 95% confidence level, k=2. The standard uncertainty of the measurement has been determined in accordance with U.S. Guide to the Expression of Uncertainty in Measurement. *Note: the 0% and 97% RH points are not ISO17025 Accredited.

1.0 INTRODUCTION

Hoefler Consulting Group, Inc. (HCG) operates meteorological monitoring stations for Northern Dynasty Mines, Inc. (NDM) in support of the Pebble Mine Project near Iliamna, Alaska. The air monitoring program is one component of ongoing baseline environmental studies being conducted to support mine permitting, mine design and mine transportation infrastructure development. The stations meet Prevention of Significant Deterioration (PSD) guidelines, although PSD permits may not be required. This report covers the Port monitoring station located near the proposed mine port site.

The Pebble Port Station is located on the west shore of Iniskin Bay, near the southern end of the bay. The station is situated on a 50' high knoll, very near the water's edge. The Port Station consists of an instrumented 11-meter sectional tower secured with three guy wires. Approximately 20' south of the tower is a 6' by 8' insulated building which houses the datalogger and power supply system. The Pebble Port Station is instrumented with PSD quality sensors monitoring the following parameters:

- Ambient Temperature (ºC): Met One 062MP Thermistor Probe at 2-m
- Temperature Difference (ºC): Met One 062MP Thermistors at 2-m and 10-m
- Wind Speed 1 (m/s): Climatronics F460 P/N 100075 Wind Speed Sensor
- Wind Direction 1 (°): Climatronics F460 P/N 100076 Wind Direction Sensor
- Wind Speed 2 (m/s): RM Young 05305 Wind Monitor-AQ
- Wind Direction 2 (°): RM Young 05305 Wind Monitor-AQ
- Sigma Theta (°): Campbell Scientific CR10X DAS calculated (Yamartino)
- Relative Humidity (%RH): Vaisala HMP45AC Relative Humidity Sensor
- Barometric Pressure (mbar): Vaisala PT101B Barometric Pressure Sensor
- Solar Radiation (W/m2): LI-COR Li-200SX Solar Radiation Pyranometer.

This report has been prepared for NDM to serve as an official review of the Pebble Port Station and a review of the overall Pebble Project Meteorological Monitoring Program. To that end, Systems and Performance Audits were undertaken in order to help demonstrate that the equipment and procedures used for collecting meteorological data by HCG meet the requirements set forth by the U.S. Environmental Protection Agency (EPA) and the Alaska Department of Environmental Conservation (ADEC).

2.0 SYSTEMS AUDIT

2.1 Systems Audit Methodology

In the *Quality Assurance Handbook for Air Pollution Measurement Systems* and the *Meteorological Monitoring Guidance for Regulatory Modeling Applications*, EPA provides guidance for conducting systems audits. EPA recommends that a systems audit be conducted to serve as a qualitative review of all aspects of a meteorological monitoring program. The systems audit includes a review of the program plan, station site, facilities, equipment, personnel, procedures, record keeping, data validation and data reporting. The systems audit should be completed within the first 30 days of operation and every year thereafter.

The *Quality Assurance Project Plan for the Pebble Project Meteorological Monitoring Program* was completed by HCG in August 2006. This systems audit consisted of a review of this document, site visits and personnel interviews. Personnel were also observed during station maintenance and calibration operations. All aspects of the program not specifically mentioned in the Plan were reviewed to determine consistency with EPA and ADEC guidelines. The complete systems audit report contained in Appendix A is organized into six major sections; 1) General Program Information, 2) Monitoring Program Staff Organization, 3) Meteorological Monitoring Station Equipment, 4) Standard Operating Procedures, 5) Documentation, 6) Data Processing and Validation, 7) Quality Assurance and Quality Control (QA/QC), and 8) Comments and Suggestions. Each section consists of a question-answer format with additional comments to provide clarity. Flow charts are also used to accurately document program staff organization and the data handling process. A complete list of the references used for the systems audit is contained in Section 4.

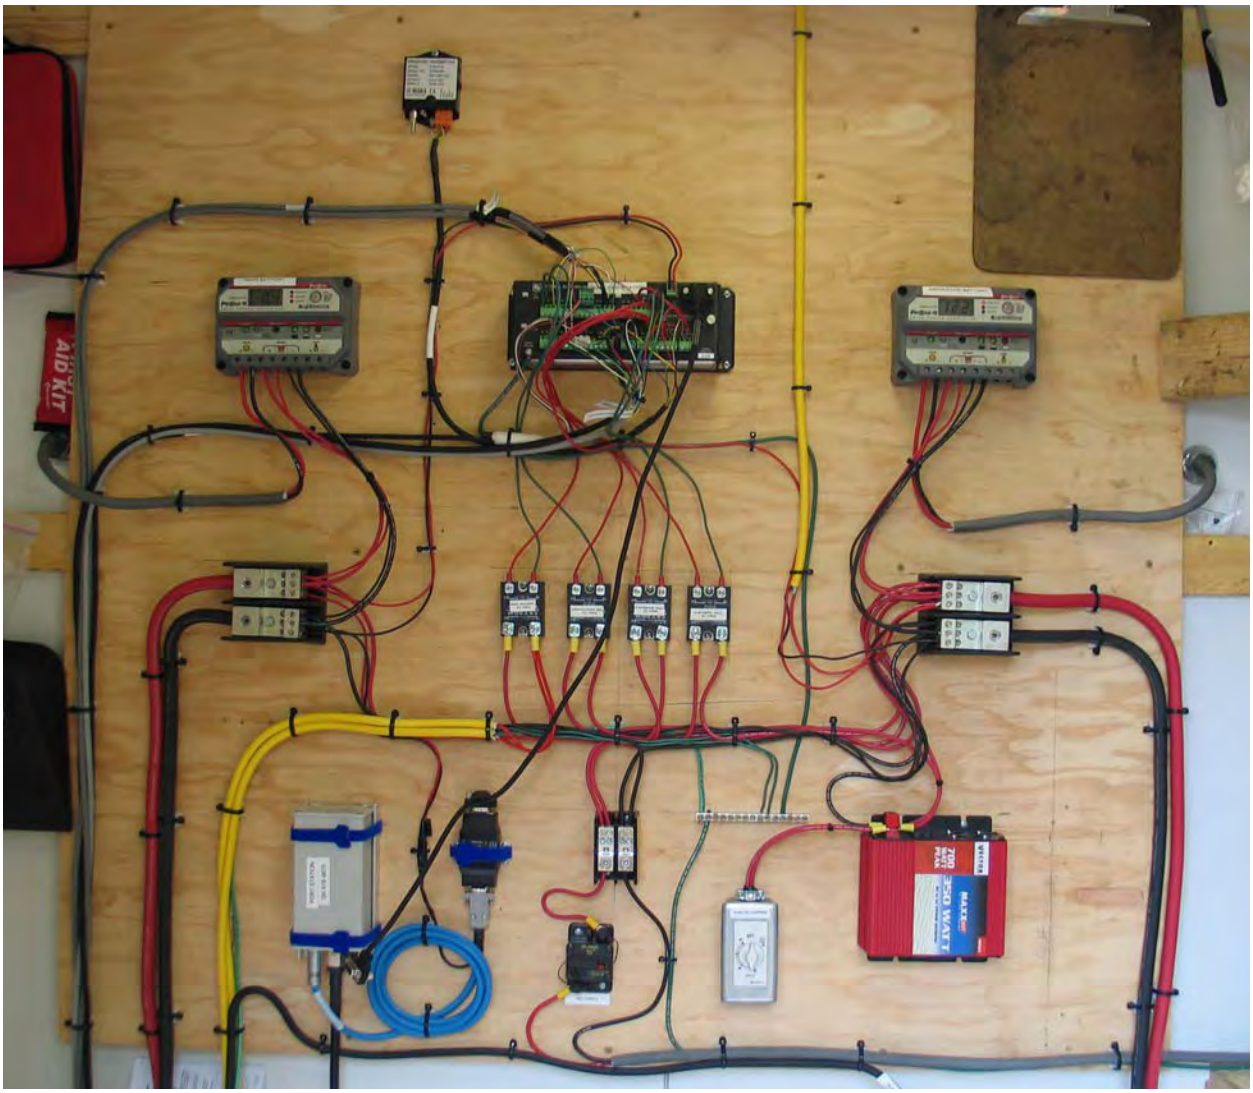
2.2 Meteorological Station On-Site Systems Audit

The on-site systems audit of the Pebble Port Station was conducted on August 21, 2006. Eric Brudie of HCG completed the systems audit with Dominic Shallies of HCG assisting and witnessing. Mr. Brudie serves as an independent auditor on this project and is not involved with day to day operations of the station.

The Pebble Port meteorological monitoring station is founded on a stable, well anchored tower with PSD quality sensors securely affixed. In order to protect instrumentation wires from animals; 2” liquid-tight conduit runs from the 12’ height on the tower to the prefab building. The data acquisition system (DAS), communications system, solar

controllers and power distribution system are mounted on a 4' by 4' plywood wiring panel mounted in the building, see photo.

Figure 2-1 Pebble Port Station DAS Wiring Panel



The Campbell Scientific CR10X DAS wiring is well organized and needs no further discussion. Constant communication between the DAS and a dedicated polling computer in the HCG office is integral to this installation. A Campbell Scientific SC932A interface converts the DAS signal to a RS-232 DCE modem signal. Three FreeWave spread spectrum radio modems transmit the signal to a SixNet industrial phone modem which is linked to the grid near Seldovia, Alaska. The met station radio and base radio rely on directional Yagi antennas focused on an omni-directional antenna at the repeater radio. The repeater radio is powered by one 35-Watt solar panel buffered through a solar controller and five 100 Amp-Hr deep cycle gel cell batteries.

Power generation at the meteorological monitoring station consists of four 50-Watt solar panels and a 21-Watt Global Thermoelectric Model 5030 Thermo-Electric Generator (TEG). One solar panel is dedicated to the DAS and meteorological instrumentation; wired through a Morningstar ProStar-15 solar controller and buffered through two 200 Amp-Hr deep cycle gel cell batteries. Three panels are dedicated to the aspirator fans, Climatronics heaters, shelter lighting and 120VAC power; wired through a Morningstar ProStar-15 solar controller and buffered through two 200 Amp-Hr deep cycle gel cell batteries. The shelter lights and 120VAC inverter for laptop use are routed through manual timers to ensure use only when operators are on site. During the winter months, November through April, the TEG is turned on to supplement the aspirator/heater power system. Aspirator fans and heaters are controlled through relays connected to the DAS control ports. Logic programmed into the DAS reduces power consumption by limiting heater use to weather conditions conducive to icing and turns fans off at night when voltage is low, considered an upset condition. Also the TEG power is routed through relays which shunt power to the critical DAS/sensor system during upset conditions.

2.3 Operations, Data Management and Documentation Systems Audit

This phase of the systems audit consists of a review of the HCG *Quality Assurance Project Plan for the Pebble Project Meteorological Monitoring Program* (Plan), and other system documentation, and a review of system operations. System operations include physically running the station and subsequent data management.

The Plan is a comprehensive document which adequately details the Pebble meteorological monitoring program. Program objectives, installations, operations, data management and quality assurance are all clearly outlined. Equally, the Pebble Port Station is representative of the Plan design. The Plan provides standard operating procedures and standard forms for all equipment field calibrations and audits. Station operators also had complete DAS and meteorological sensor manuals on hand at the station. Plan and documentation review are covered further in Appendix A.

Station operators were observed during calibration and maintenance procedures and appeared knowledgeable about all facets of operating the monitoring station. Data are downloaded daily using an automated script on a dedicated polling computer located at the HCG office. The raw data are appended to a station file located on the HCG server, which is backed up daily. The data manager copies the raw data to a custom Access/Excel database, leaving the raw data unaltered. The custom database creates a series of graphs of all meteorological data as well as some station operational parameters. These plots are reviewed 5-6 days per week in order to immediately

identify station upsets. An example is a graph of solar radiation and battery voltage; which reveals potential problems with daily charge cycles. Both the Climatronics and RM Young Wind sensor data are plotted together to indicate problems with one of the sensors. All station parameters are plotted with ranges and pairings intended to best reveal upset conditions. Problems are immediately identified and corrective action planned and executed. Steps are taken to flag data which may have been identified as suspect during this graphical data review. Data generated during station maintenance, audits and calibrations are also flagged as invalid.

Prior to compilation of data summary reports, data are screened using EPA recommended screening criteria. Data flagged as outliers by the screening program are further reviewed for consistency with prevailing conditions and then permanently invalidated or validated. Data ultimately invalidated are permanently removed from the database and the reasoning is codified in a special column in the database. This cleaned dataset is used for all subsequent data summaries, wind roses, data reports and capture rate calculations. More detailed discussion of the operations and data management are contained in the Systems Audit Appendix A.

2.4 Comments and Suggestions

The Pebble Port Station is a well designed and operated meteorological monitoring station. The remote station is equipped with a robust and sophisticated power supply. The systems audit revealed that HCG possesses the necessary organization, personnel, training, equipment, quality assurance, and quality control procedures to accurately collect and report PSD quality data. HCG adequately maintains the Pebble Port Station and practices sufficient data review and preventive maintenance to avoid unnecessary data loss.

The following recommendations are made to the program in order to improve the operation of the stations and ensure their operation is in accordance with standards:

- Create custom site visit checklists
- Keep a file on site containing copies of previous checklists.

3.0 PERFORMANCE AUDIT

3.1 Performance Audit Methodology

During the performance audit, the station datalogger is interfaced with a portable laptop computer to display the outputs for the meteorological sensors. The value of each meteorological sensor is compared to the output value from the appropriate piece of audit equipment or from calibrated instruments collocated with the sensor. The difference between the station's datalogger reading and the output from each audit instrument is compared with established PSD limits to determine the accuracy of each sensor. Additionally, threshold torques for wind speed and wind direction are measured with audit equipment and compared with manufacturer torques corresponding to the PSD threshold speed of 0.5 m/s. Table 3-1 provides a summary of the performance audit methods and limits used to audit each parameter at the stations.

Table 3-1 Performance Audit Methods and Acceptable Limits

Parameter	Audit Method	EPA/Manufacturer Limit
Datalogger Time	NOAA Clock	≤ ±5:00 minutes from AST
Temperature Accuracy	Collocated NIST thermistor	≤ ±0.5 °C
Temperature Difference	Collocated NIST thermistor	≤ ±0.1 °C
Wind Speed Accuracy	Synchronous rpm motor	≤ ±0.2 m/s + 5 % observed
Wind Spd Torque (Clim)	Torque watch	≤ 0.35 g-cm (0.0049 oz-in)
Wind Spd Torque (RMY)	Torque watch	≤ 1.0 g-cm (0.014 oz-in)
Wind Direction Alignment	GPS, compass or landmark	≤ ±5° from true azimuth
Wind Direction Accuracy	Linearity tester	≤ ±5° per audit point
Wind Direction Linearity	Linearity tester	≤ 3° mean absolute average
Wind Dir Torque (Clim)	Torque watch	≤ 7.5 g-cm (0.104 oz-in)
Wind Dir Torque (RMY)	Vane torque gauge	≤ 11 g-cm (0.153 oz-in)
Relative Humidity	Collocated NIST RH sensor	≤ ±1.5 °C of dew point
Barometric Pressure	Collocated NIST BP sensor	≤ ±3 mbar
Solar Radiation	Collocated NIST sensor	≤ ±5% of input+resolutuion[1]

1. This audit limit is modified from PSD standard, as discussed below.

3.1.1 Data Acquisition System

An audit of the datalogger is conducted by comparing all datalogger outputs to the audit standards, as described below. The datalogger time is checked against an instantaneous time reading from the National Oceanic and Atmospheric Administration (NOAA) clock in Boulder, Colorado, via a global positioning system (GPS) handheld unit or telephone contact with the NOAA clock.

3.1.2 Air Temperature and Air Temperature Difference

The 2-meter and 10-meter thermistors are removed from their aspirator shields and collocated with a National Institute of Standards and Technology (NIST) traceable digital thermometer. The station thermistors and the transfer standard NIST thermometer are taped together and immersed in insulated thermoses containing a series of fluid baths; hot water (35°C to 45°C), warm water (15°C to 25°C), water/ice bath (0°C), cold glycol (-15°C to -25°C) and very cold glycol (-35°C to -45°C). Dry ice is used to cool the glycol baths. Each liquid bath is agitated and allowed to equilibrate before simultaneous readings are taken from the three instruments.

An alternate method can also be used for the low temperature audits, employing a Thermal Mass Device (TMD). The TMD consists of a 6” diameter by 9” high solid aluminum block milled to fit snuggly inside of an insulated Dewar flask. On the top of the TMD, and in corresponding locations on the flask lid, are holes sized to accommodate a variety of Campbell, Climatronics, Met-One and VWR thermistors. The TMD is cooled to the target temperatures by contact with dry ice and then placed in the insulated flask. The audit and station thermistors are inserted through the flask lid and into the appropriate holes in the TMD. After the TMD and the thermistors are allowed to equilibrate, readings for all thermistors are simultaneously taken. The aluminum TMD has a very high thermal conductivity and when allowed to equilibrate inside of the insulated flask, thermal gradients across the TMD are very small.

In all cases, the difference between the individual station thermistors and the NIST standard are compared to the PSD temperature accuracy limit of ±0.5°C. The difference between the two station thermistors (10-m°C minus 2-m°C) is compared to the PSD temperature difference limit of ±0.1°C.

3.1.3 Wind Speed

Anemometers are audited to determine their accuracies in reading known wind speeds and to ascertain the sensor’s threshold torque. The Climatronics and RM Young sensors are audited in very similar manners and are discussed together. The

instruments are tested after removal from the tower and after removal of the sensor's props or cups.

First, an RM Young synchronous motor is attached to the shaft of the anemometer by using brand specific coupling devices. The sensor shaft is rotated at several different known revolutions per minute (rpm). Each rotational speed in rpm is equated to a wind speed in meters per second (m/s) by using the anemometer manufacturer's linear calibration formula. The difference between the calculated input speed in m/s and the datalogger output is compared to established PSD limits for each input rpm.

Next, a high precision torque watch is attached to the shaft of the anemometer, once again using custom couplings. Torque readings are made in both directions in each quadrant along the axis of rotation of the shaft. The maximum reading is recorded for the torque required to turn the shaft of the anemometer. The torque value recorded during the audit is compared to manufacturer's torque corresponding to the minimum PSD threshold speed of 0.5m/s.

3.1.4 Wind Direction

The wind direction sensors are first audited as-found to determine the accuracy of their alignment with respect to true north (true azimuth alignment) using one of four methods. In one method, a handheld GPS unit is used to measure the position of the auditor with respect to a waypoint captured under the wind sensor's position on the tower. Using binoculars, the tail of the wind vane is aligned with the auditor's position at a distance of several hundred feet from the tower. The GPS bearing back to the tower waypoint is then compared to the DAS reading. The difference between the two should not exceed ±5° per audit point. This procedure is repeated at least 4 times, once per quadrant, generally near the cardinal directions. The second method uses a calibrated precision compass mounted on a gimbal and tripod. The compass declination is preset for the specific location and date using one of a variety of magnetic declination computer models. The sensor tail is aligned toward the auditor while auditor sights the compass toward the sensor and readings are taken in a similar manner to the GPS method.

Another option is to align the tail of the sensor with a distant identifiable landmark of know bearing. The bearing to the landmark may be ascertained using a variety of methods. One method involves physically capturing a distant GPS waypoint, such as at a discernable structure or emissions stack. Bearings to inaccessible natural landmarks, usually distant mountain peaks, are acquired through the use of various computer mapping programs, such as Natural Geographic's TOPO program or USGS digital

raster graphics (DRGs) loaded into AutoCAD. The bearing from the station location to the landmark is compared to the DAS reading. This method yields the most accurate audit value, but is limited by weather and availability of discernable landmarks. The final method is to align the vane with the tower guy wires or preset survey markers, whose bearing has been ascertained using precision survey equipment.

The wind direction accuracy and linearity are subsequently audited after the wind direction sensor is removed from the tower. The Climatronics sensor is mounted on a Climatronics Model 101984 linearity tester and the RM Young sensor is mounted on an RM Young Model 18112 Vane Angle Bench Stand. Both test fixtures are keyed to their respective sensor and graduated from 0° to 360°. A series of readings starting at 30° and then clockwise in 30° increments are taken. The RM Young is read from 30° to 360° and the Climatronics is read from 30° to 540°. The Climatronics sensor is tested 180° past 360° in order to test the second potentiometer used in some DAS programming. Although not required, the Climatronics sensor is also tested with the vane attached in order to ascertain sensor accuracy and linearity relative to the instrument crossarm. The vane is aligned along the axis of the crossarm to yield the 0°/360° and 180° values and against a square held to the crossarm for the 90° and 270° directions. Four readings are taken in a clockwise direction and four are taken counterclockwise to complete the test. For both the linearity test fixture and crossarm tests, individual error values are assessed for the PSD accuracy limit of ±5° per point and the mean absolute average error is assessed against the linearity limit of 3°.

Next, the RM Young wind direction threshold is tested by measuring wind vane torque using an RM Young Model 18331 Vane Torque Gauge. This device saddles the wind vane and a calibrated spring is pulled to determine maximum torque from readings taken in both directions in all four quadrants. The Climatronics wind direction starting torque is measured with the vane removed by using a precision torque watch in the same manner as the wind speed torque. The highest torque readings are compared to specific manufacturer limits for instrument staring torque.

Finally, the wind direction sensors are placed back on the tower and as-left audits of the azimuth alignments are conducted to ensure the instruments are properly reinstalled.

3.1.5 Relative Humidity

Relative humidity (RH) is audited using a collocated NIST traceable RH sensor. The NIST sensor and the field sensor are collocated out of direct sunlight to eliminate solar radiation effects, preferably inside of the motor aspirated shield. If the NIST standard reads directly in dew point °C, those readings are used; if not, relative humidity and

temperature readings are used. For the audit, instantaneous readings of dew point, relative humidity and temperature are recorded from the transfer standard and the DAS. All relative humidity and temperature readings are converted to dew point in order to assess the PSD error limit of ±1.5°C dew point.

3.1.6 Barometric Pressure

Barometric pressure (BP) is audited using a collocated NIST traceable BP sensor. The difference between the NIST sensor and the station sensor are compared to the PSD limit of ±3 mbar.

3.1.7 Solar Radiation

Outputs of the station sensor are compared to the output of a level collocated audit solar radiation sensor. The audit sensor is connected to an independent audit datalogger with the scan interval and clock synchronized with the station DAS. Hourly average solar radiation readings and instantaneous readings are recorded during the audit and then input into a custom spreadsheet to calculate a linear regression for the data. The PSD limit for solar radiation audits is ±5% of observed, but this standard is very difficult to obtain at the northern latitude of this installation. This EPA standard is currently undergoing review and is expected to change. A well excepted substitute is that individual DAS and audit data pairs are compared to a limit of ±5% of observed **+ EPA minimum instrument resolution (10W/m²)**. Individual data pairs are evaluated against this standard, but the overall set is restricted to a 5% error by limiting allowable linear slope to 1.0±0.05.

3.2 Performance Audit Results

The performance audit was conducted at the Pebble Port Station on August 21, 2006 with Dominic Shallies of HCG assisting. All sensors were challenged with certified audit equipment and yielded errors below the PSD limits. The thermistor aspirator fans had failed and were replaced during the audit. Summary audit results are contained in Table 3-2 and complete audit reports and audit equipment calibration certificates are contained in Appendix B and Appendix C respectively.

3.3 Performance Audit Recommendations

- Set up DAS to read aspirator fan amperage in order to monitor fan status.

Table 3-2 Port Station August 21, 2006 Performance Audit Summary

Parameter	Limit	Units	Max Err	Status
Datalogger Time	≤ ±5:00	Min:Sec	0:07	Pass
2-m Temperature Accuracy	≤ ±0.5	°C	0.21	Pass
10-m Temperature Accuracy	≤ ±0.5	°C	0.21	Pass
Air Temperature Difference	≤ ±0.1	°C	0.00	Pass
Climatronics Wind System				
Wind Speed Torque	≤ 0.0049	oz-in	<<0.003	Pass
Low Wind Spd. Accuracy (≤5m/s)	≤ ±0.2	m/s	0.00	Pass
High Wind Spd. Accuracy (>5m/s)	≤ ±5	% input	0.0	Pass
Wind Direction Torque (old bearings)	≤ 0.104	oz-in	0.100	Pass
Wind Direction Torque (new bearings)	≤ 0.104	oz-in	0.070	Pass
Wind Dir. Azim. Align. (as-found)	≤ ±5	Degree	-0.6	Pass
Wind Direction Accuracy	≤ ±5	Degree	-1.3	Pass
Wind Direction Linearity	≤ 3	Degree	0.5	Pass
Wind Dir. Azim. Align. (as-left)	≤ ±5	Degree	-2.8	Pass
RM Young Wind System				
Wind Speed Torque[1]	≤ 0.014	oz-in	0.008	Pass
Low Wind Spd. Accuracy (≤5m/s)	≤ ±0.2	m/s	0.00	Pass
High Wind Spd. Accuracy (>5m/s)	≤ ±5	% input	0.0	Pass
Wind Direction Torque (old bearings)	≤ 11	g-cm	9.0	Pass
Wind Direction Torque (new bearings)	≤ 11	g-cm	6.0	Pass
Wind Dir. Azim. Align. (as-found)	≤ ±5	Degree	2.5	Pass
Wind Direction Accuracy	≤ ±5	Degree	-4.5	Pass
Wind Direction Linearity	≤ 3	Degree	2.6	Pass
Wind Dir. Azim. Align. (as-left)	≤ ±5	Degree	2.8	Pass
Relative Humidity (dew point)	≤ ±1.5	°C	0.7	Pass
Barometric Pressure	≤ ±3	Mbar	1.0	Pass
Solar Radiation	≤ ±5+Res	% input	-5.8	Pass

1. Could not replace RM Young speed bearing due to stripped set screw.

1.0 GENERAL PROGRAM INFORMATION

1.1 Site Description

The Pebble Port tower is located near the middle of a small point on the west shore of Iniskin Bay. The 50' high point is approximately 75' wide and 150' long and is vegetated with Alders, low shrubs and small Spruce trees. East of the station are the waters of Iniskin Bay and to the west the topography rises steeply to almost 3,000'.

1.2 Site Location

1.2.1 Coordinates

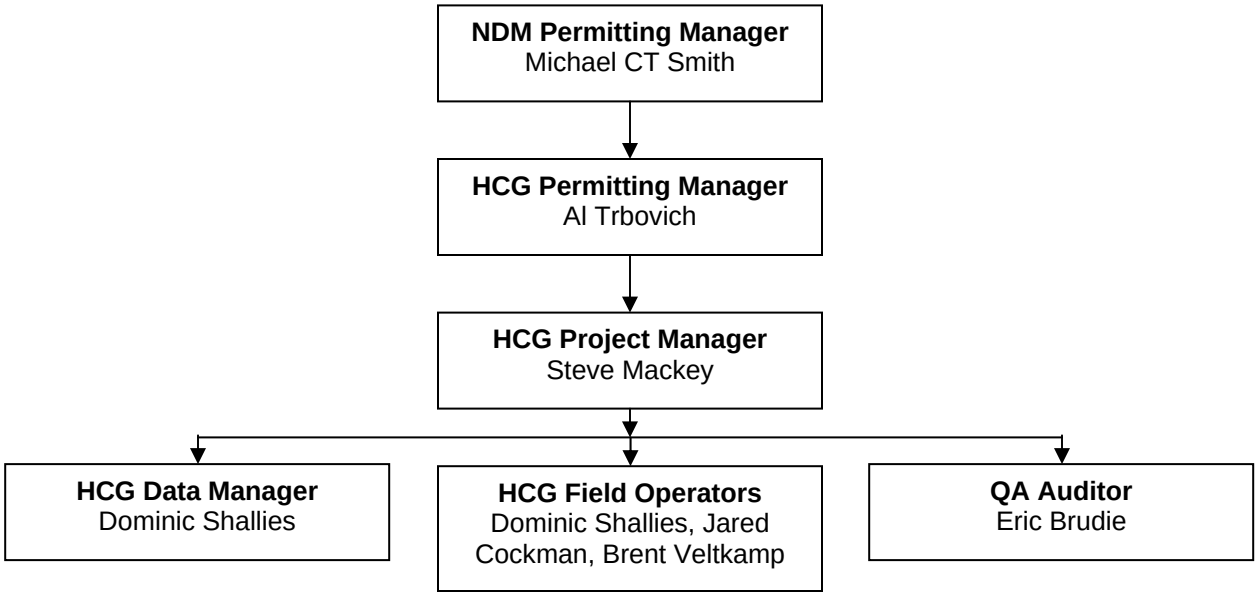
Indicated by Operator	Determined by Auditor
59° 39' N	59° 38.959' N
153° 28' W	153° 28.314' W
Elevation: 40 feet	Elevation: 50 feet

1.2.2 Appearance and Safety

Does the site appear clean, organized and well maintained?	■ Yes □ No	Comments: None.
Does the site appear to be safe and reasonably hazard free?	■ Yes □ No	Comments: None.
Does the site have a shelter for operators?	■ Yes □ No	Comments: None.
Does the site have emergency equipment such as a first aid kit available?	■ Yes □ No	Comments: None.
Does the site have adequate measures to prevent human tampering?	■ Yes □ No	Comments: 6' fence surrounds station.
Does the site have adequate measures to prevent damage from animals?	■ Yes □ No	Comments: Cables protected in liquid-tight conduit and electronics inside shelter.

2.0 MONITORING PROGRAM STAFF ORGANIZATION

- Draw diagram indicating the organizational structure of the monitoring program. Include names and titles:



3.0 METEOROLOGICAL MONITORING STATION EQUIPMENT

3.1 Inventory

Parameter	Make	Model	Serial No.
DAS	Campbell Scientific	CR10X	X41611
DAS Wiring Panel	Campbell Scientific	CR10X	31375
Temperature (2-meter)	Met One	062MP	E3381, ID #1/2
Temperature (10-meter)	Met One	062MP	E3381, ID #2/2
Temperature Aspirators	Met One	076B-4	Unknown
Primary Wind Speed	Climatronics	F460-100075	5008
Primary Wind Speed Cups	Climatronics	HD Al. P/N 101287	2285

3.2 Equipment Evaluation

3.2.1 Data Acquisition System (DAS) and Communications System

Is the DAS well protected from the elements with adequate room for maintenance?	■ Yes □ No	Comments: DAS inside of a weatherproof building, mounted on a 4'x4' wiring panel.
Is the DAS rated for operation in the expected local temperature range?	■ Yes □ No	Comments: -55°C to + 85°C.
Are all sensor cables neatly and securely connected to the correct DAS channels?	■ Yes □ No	Comments: Well organized wiring panel.
Is remote communication to the DAS system available to operators?	■ Yes □ No	Comments: DAS to SC932A interface to FreeWave RF network to SixNet modem.
Are all components of the DAS and communications system operational?	■ Yes □ No	Comments: None.
Are the DAS and communication equipment properly grounded?	■ Yes □ No	Comments: 8' ground rod wired to central ground buss.
Are the DAS and communication equipment protected from lightning?	□ Yes ■ No	Comments: There is no lighting protection, but area not prone to strikes.

3.2.2 Power Supply System

Does the system have a stable power supply or line power?	■ Yes □ No	Comments: Very robust alternative power supply described below.

- Describe the meteorological monitoring station power supply system.

The DAS, communications equipment and meteorological sensors are powered by one 50-Watt solar panel, buffered through two 200 amp-hr deep cycle gel cell batteries. The aspirator fans and Climatronics wind sensor heaters are powered by three 50-Watt solar panels buffered through two 200 amp-hr deep cycle gel cell batteries. During the winter months (November through April), the aspirator/heater system is also powered by a 21-Watt propane Thermo-Electric Generator (TEG). The isolated DAS and Aspirator power systems can be interconnected during upset conditions through an array of relays managed through the DAS control ports. The DAS monitors battery levels and can shunt the two power systems should one run low. The DAS also has algorithms programmed to assess weather conditions and limit heater use when not required.

3.2.3 Meteorological Monitoring Sensors

Do all sensors appear to be clean, intact, in good condition and well maintained?	■ Yes □ No	Comments: None.
Are all sensors operational, online and reporting data?	■ Yes □ No	Comments: None.
Do all sensors meet EPA criteria for PSD quality sensors?	■ Yes □ No	Comments: See table below.
Are spare parts stocked for items which are frequently worn out or broken?	■ Yes □ No	Comments: Spare props, cups and vanes onsite and spare bearings at HCG office.

3.2.4 EPA PSD Meteorological Instrument Standards

Parameter	Instrument Specifications	EPA Standard	Pass?
Air Temperature (2-M, 10-M & Delta-T) – Met One Mdl. 062MP			
Accuracy (2-m & 10-m):	±0.05 °C	±0.5 °C	Yes
Accuracy (Delta-T):	±0.02 °C	±0.1 °C	Yes
Range (Operating Temp):	-50°C to +50°C	-20°C to +30°C	Yes
*Resol. (2-m & 10-m):	0.01°C	0.1°C	Yes
*Resolution (Delta-T):	0.01°C	0.02°C	Yes
Response Time:	10 seconds	≤1 minute	Yes
Wind Speed – Climatronics Mdl. F460-100075			
Accuracy:	±0.07 m/s or ±1% of obs.	±0.2 m/s + 5% of observed	Yes
Range:	0.0 m/s to 65 m/s	0.5 m/s to 50 m/s	Yes
*Resolution:	0.01m/s	0.1 m/s	Yes
Threshold Speed:	0.22 m/s	≤0.5 m/s	Yes
Distance Constant:	<4.0 m (HD Alum. Cups)	≤5 m	Yes
Operating Temperatures:	-40°C to +60°C	-30°C to + 30°C	Yes
Wind Direction – Climatronics Mdl. F460-100076			
Accuracy:	±2°	±5°	Yes
Range:	0° to 360°	0° to 360°	Yes
*Resolution:	0.1°	1°	Yes
Threshold Speed:	0.22 m/s	≤0.5 m/s	Yes
Distance Constant:	<2.5 m (Heavy Duty Vane)	≤5 m	Yes
Damping Ratio:	>0.4 @10° initial angle	0.4 to 0.7	Yes
Operating Temperatures:	-50°C to +60°C	-30°C to + 30°C	Yes
Wind Speed – RM Young Mdl. 05305 Wind Monitor-AQ			
Accuracy:	±0.2 m/s or 1% of observed	±0.2 m/s + 5% of observed	Yes
Range:	0.0 m/s to 50 m/s	0.5 m/s to 50 m/s	Yes
*Resolution:	0.01m/s	0.1 m/s	Yes
Threshold Speed:	0.4 m/s	≤0.5 m/s	Yes
Distance Constant:	2.1 m	≤5 m	Yes
Operating Temperatures:	-50°C to +50°C	-30°C to + 30°C	Yes
Wind Direction – RM Young Mdl. 05305 Wind Monitor-AQ			
Accuracy:	±3°	±5°	Yes
Range:	0° to 360°	0° to 360°	Yes
*Resolution:	0.1°	1°	Yes
Threshold Speed:	0.5 m/s @10° displacement	≤0.5 m/s	Yes
Distance Constant:	1.2 m	≤5 m	Yes
Damping Ratio:	0.45	0.4 to 0.7	Yes
Operating Temperatures:	-50°C to +50°C	-30°C to + 30°C	Yes
Relative Humidity – Vaisala Mdl. HMP45AC			
Accuracy:	±2/3% at 0-90/90-100% RH	±1.5°C Dew Point**	Yes
Range:	0.8% to 100% RH	-30°C to +30°C Dew Point**	Yes
*Resolution:	0.1% RH	1% RH	Yes
Response Time:	10 sec	≤30 minutes	Yes
Operating Temperatures:	-40°C to +60°C	-30°C to + 30°C	Yes
** EPA criteria in units of dew point, RH and operating temperature ranges meet these criteria.			
Barometric Pressure – Vaisala Mdl. PTB101B			
Accuracy:	±0.5 mbar	±3 mbar	Yes
Range:	600 mbar to 1060 mbar	Not Specified	N/A
*Resolution:	0.1 mbar	0.5 mbar	Yes
Response Time:	300 msec	Not Specified	N/A
Operating Temperatures:	-40°C to +60°C	Not Specified	N/A

EPA Recommended Meteorological Instrument Standards (Continued)

Parameter	Instrument Specifications	EPA Standard	Pass?
Solar Radiation – LI-COR Mdl. Li-200SX Pyranometer			
Accuracy:	±5% Observed	±5% Observed	Yes
Range:	0 W/m^2 to 3000 W/m^2	Not Specified	N/A
*Resolution:	1 W/m^2	10 W/m^2	Yes
Response Time:	10 µs	5 seconds	Yes
Spectral Response:	400 nm to 1,100 nm	285 nm to 2800 nm	No
Operating Temperatures:	-40°C to +65°C	-20°C to +40°C	Yes
* For all instruments; resolutions are the result of instrument type, configuration and DAS programming.			

3.3 Station Location and Siting

3.3.1 Tower

Do all obstructions exist below a 1:10 slope away from the tower base? ■ Yes □ No Comments: None.

Is the height of the tower 10 meters above the ground? ■ Yes □ No Comments: None.

Is the tower stable and plumb? ■ Yes □ No Comments: None.

Is the tower protected from lightning? □ Yes ■ No Comments: There is no lighting protection, but area not prone to strikes.

3.3.2 Temperature and Relative Humidity Sensors

Are the sensors mounted at least 2-m above open level ground at least 9-m in diameter? ■ Yes □ No Comments: None.

Are the temperature difference probes at heights of 2-m and 10-m above the ground? ■ Yes □ No Comments: None.

Are the sensors at a distance greater than four times the height of any obstruction? ■ Yes □ No Comments: None.

Is the ground beneath the temperature sensors natural native material? ■ Yes □ No Comments: None.

Is the site free of any natural features that could bias temperature data (e.g. open water, sloping ridge, etc.)? ■ Yes □ No Comments: None.

Is the site free of any man-made features that could bias temperature data (e.g. asphalt, concrete, exhaust plumes, etc.)? ■ Yes □ No Comments: None.

Are the sensors located at least 30 meters from large paved areas? ■ Yes □ No Comments: None.

Is the ambient temperature sensor protected from the influence of solar radiation? ■ Yes □ No Comments: Housed in Met One Mdl 076B-4 Motor Aspirated Radiation Shield.

Are the temperature difference sensors located in identical aspirated shields? ■ Yes □ No Comments: Housed in Met One Mdl 076B-4 Motor Aspirated Radiation Shields.

3.3.3 Wind Speed and Wind Direction Sensors

Is the horizontal distance between the instruments and any obstruction at least 10 times the height of the obstruction?	■ Yes □ No	Comments: None.
Are the instruments at least 1.5 times nearby building height(s) above the building roof(s), or 10-m high?	■ Yes □ No	Comments: None.
Are the wind speed and wind direction sensors stable and plumb?	■ Yes □ No	Comments: None.
Is the distance of the sensor on the cross-arm at least twice the diameter of the tower?	■ Yes □ No	Comments: Climatronics Sensors mounted on a crossarm which meets this criterion.
Is the distance of the sensor on the cross-arm at least twice the diameter of the tower?	■ Yes □ No	Comments: RM Young sensor mounted on an extension arm which meets this criterion.
Is the wind direction sigma theta data being collected according to EPA requirements?	■ Yes □ No	Comments: DAS calculated using Yamartino method and a one-second scan interval.

3.3.4 Relative Humidity and Barometric Pressure

Is the relative humidity sensor open to the atmosphere & protected from precipitation?	■ Yes □ No	Comments: Housed in 2-m aspirated shield with temperature sensor.
Is the barometric pressure sensor open to atmosphere & protected from precipitation?	■ Yes □ No	Comments: Housed in unsealed shelter, mounted on wiring panel.

3.3.5 Solar Radiation

Is the instrument situated above the plane of any obstructions that could cast shadows?	■ Yes □ No	Comments: None.
Is the sensor situated south of the tower to minimize obstruction from the tower?	■ Yes □ No	Comments: None.

4.0 STANDARD OPERATING PROCEDURES

4.1 General

Is the station visited on a preset schedule?	■ Yes □ No	Comments: None.
Have standard SOPs been developed, and are they being followed by the operators?	■ Yes □ No	Comments: None.
Does the operator follow a preventative maintenance schedule?	■ Yes □ No	Comments: None.
Are site visits and maintenance activities properly documented in a Station Log?	■ Yes □ No	Comments: Site visit memos are compiled.
Are station operators knowledgeable and competent regarding effective operation?	■ Yes □ No	Comments: None.
Have operators attended any formal training for operating met monitoring stations?	□ Yes ■ No	Comments: All operators have one to two years onsite experience.

Are copies of the NIST certifications for the calibration equipment made available?	■ Yes □ No	Comments: Attached.

4.2 DAS and Meteorological Sensors

Are regular multipoint QC checks performed on the DAS?	■ Yes □ No	Comments: DAS audited by virtue of the instrument output values.
Are regular multipoint QC checks performed on the meteorological sensors?	■ Yes □ No	Comments: None.
Are the sensors visually inspected for defects and problems?	■ Yes □ No	Comments: None.
Are ambient conditions compared with sensor readings from the DAS?	■ Yes □ No	Comments: DAS output compared to Iliamna Airport weather station.
Are data frequently reviewed for reasonableness and completeness?	■ Yes □ No	Comments: None.
Is a copy of the datalogger program made available for review?	■ Yes □ No	Comments: None.

5.0 DOCUMENTATION

5.1 System Reference and Maintenance Manuals

Does the operator have all required DAS and meteorological instrument manuals?	■ Yes □ No	Comments: On-site and at HCG offices.
Does the operator have configuration and wiring schematics specific to the station?	■ Yes □ No	Comments: Operator carries wiring schematics.

5.2 Station Monitoring Plan and Report Forms

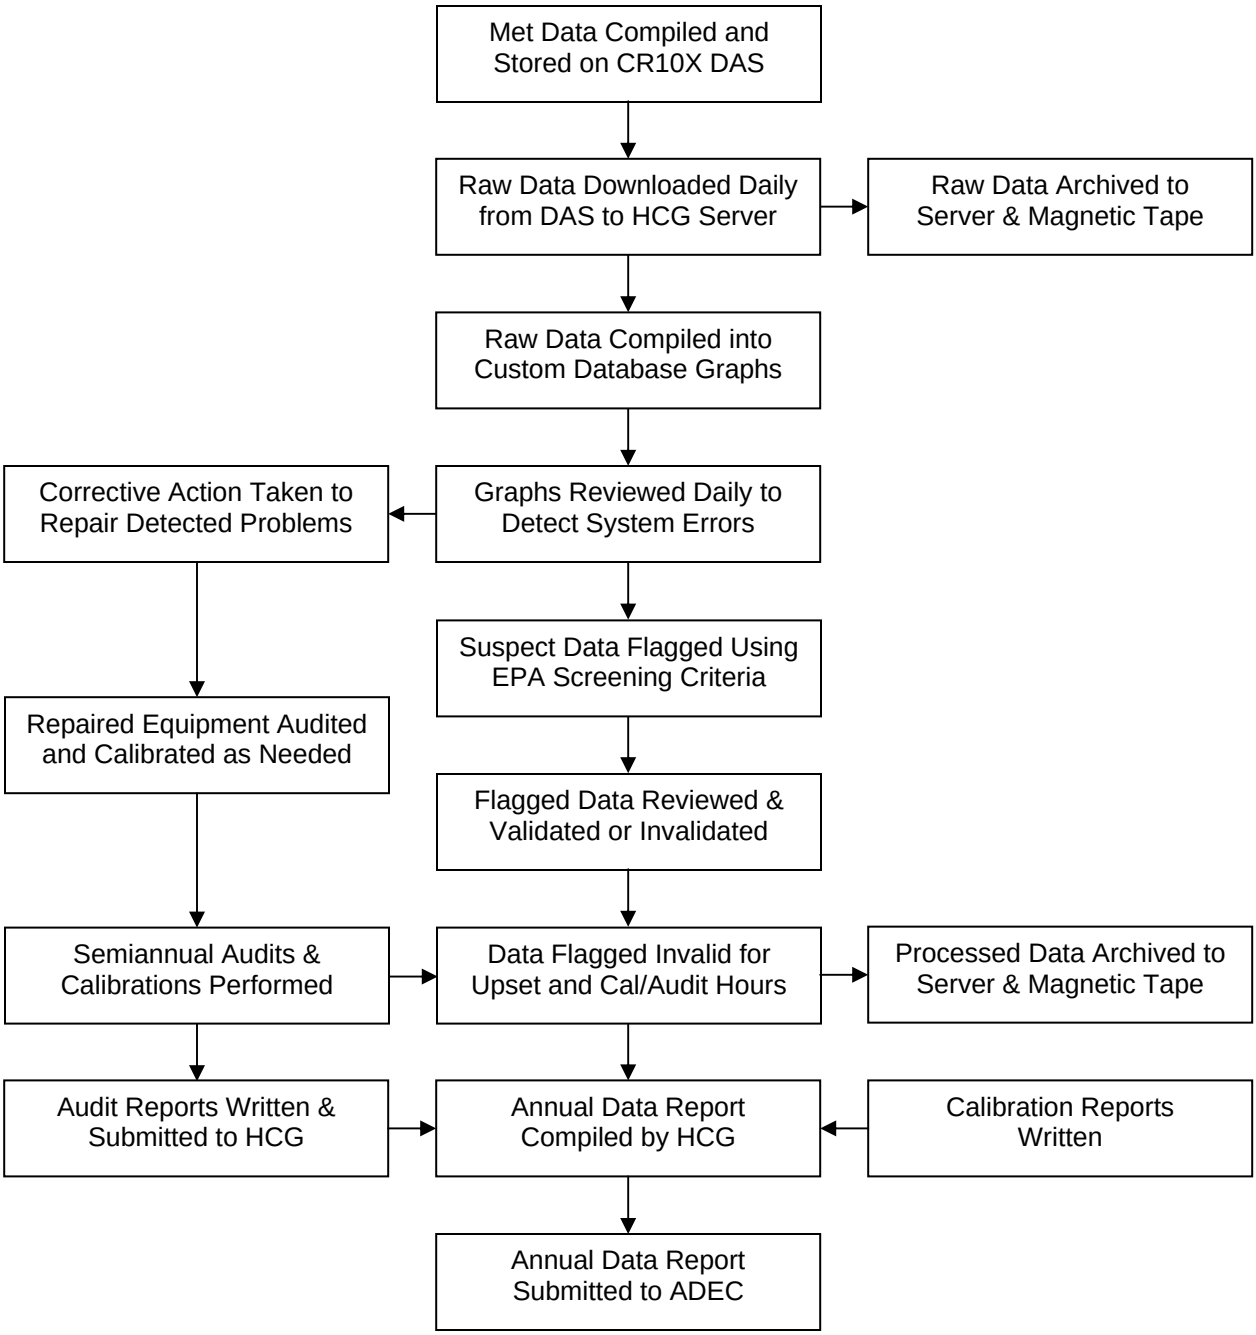
Is the Monitoring/QA plan comprehensive and reflective of the actual installation?	■ Yes □ No	Comments: None.
Does the Monitoring/QA plan indicate the intended use for the data collected during the monitoring program?	■ Yes □ No	Comments: Collect PSD quality data to meet dispersion modeling requirements and satisfy mine/transportation design requirements.
Does the system outlined in the QA plan meet the objectives outlined above?	■ Yes □ No	Comments: PSD quality installation.
Does the QA Plan indicate the intended schedule for reports to be submitted?	■ Yes □ No	Comments: None.
Does the station have an activity log?	□ Yes ■ No	Comments: Site visit memos written after each visit to supplant a log book.
Does the station have a formal Site Visit and Checklist Form?	□ Yes ■ No	Comments: No formal checklist used.
Does the station have an adequate Operations Manual?	■ Yes □ No	Comments: Monitoring/QA plan and equipment manuals.

Does the station have an adequate Calibration Report Form and copies of previous calibrations and audits?	■ Yes □ No	Comments: None.
Are report forms and site logs properly completed and current?	■ Yes □ No	Comments: None.

6.0 DATA PROCESSING and VALIDATAION

6.1 Overall Data Management

- Diagram the flow of data from monitoring equipment to submission of a final report.



6.2 Data Collection and Initial Data Review

Is the station polled and data downloaded on a regular basis?	■ Yes □ No	Comments: Daily via RF modem and telephony modem.
Are the monitoring station data reviewed on a regular basis?	■ Yes □ No	Comments: Data imported into custom graphs and reviewed 5-6 days per week.
Are the monitoring station data screened on a regular basis?	■ Yes □ No	Comments: Data screened using EPA criteria prior to summary compilations.
Are procedures in place for backing up raw data?	■ Yes □ No	Comments: Raw data files are backed up on the HCG server and on magnetic tape.
Are written procedures for data handling available for the project?	■ Yes □ No	Comments: None.

- Describe the data polling process and initial data evaluation.

Data is downloaded from the station on a daily basis using a dedicated data polling computer located at the HCG office. The raw *.dat file is appended to the existing raw station data file located on the HCG server, which is backed up to tape daily. The raw data are copied to an Access/Excel database file which generates custom graphs of the various meteorological and operational parameters. These graphs are reviewed 5-6 days per week in order to identify station problems. This graphical data review is the frontline of maintaining a complete and defensible dataset. Station upsets are instantly identified and repaired within days. Copies of both the raw unadjusted data and the custom database files are retained for a minimum of 5 years.

6.3 Corrective Actions

Are procedures established for initiating corrective actions during data processing?	■ Yes □ No	Comments: Daily graphical data review and subsequent reactions.

- Describe procedures for initiating, tracking and closing corrective actions.

When nonconformance issues are recognized during graphical review, the Lead Operator/Data Manager plans and executes corrective action. A calibration check is performed on any sensor which is repaired or replaced during the action. A site visit memo outlining the nature of the problem and repairs undertaken is written and saved to the station file. Any quantifiable error is also documented for possible data validation. The Operator/Data Manager ensures the erroneous data are flagged for the period from initial noncompliance until repair and calibration.

6.4 Data Validation

Are data validation procedures established and in use?	■ Yes □ No	Comments: None.
Are adjusted and unadjusted data sets maintained?	■ Yes □ No	Comments: Both are backed up on the HCG server and magnetic tape.

- Describe the initial data validation procedure.

Data is compiled in a custom Excel spreadsheet programmed to evaluate meteorological data against EPA recommended PSD data screening criteria. The data are screened for events such as; extended periods of zero wind speed (indicating icing or worn bearings), temperatures outside of the known monthly max/min for the area, etc. Nonconforming data are flagged by the screening program for further investigation. Also, data periods for individual parameters are flagged for times when the corresponding instrument was undergoing field servicing, calibrations or audits. Periods when instruments are known to have been out of calibration or malfunctioning are also flagged.

- Describe procedures for validating and invalidating flagged data (outliers).

Data flagged during the screening process described above are manually reviewed. If the data have a quantifiable, consistent and documented bias, they may be adjusted and then validated. Specific guidelines are detailed in the Plan. Data which have been flagged by the screening program are also compared to local weather conditions as determined from other sources. Examples where data flagged during screening may be validated include periods when winds were known to have been exceptionally calm at nearby stations or extreme temperatures outside the historical max/min were witnessed. At this point, flagged data are permanently validated and left in the database or invalidated and removed from the database. Data removed from the database are replaced with an alphanumeric code to indicate the reason for invalidation.

- Identify those responsible for data validation.

Name: Dominic Shallies
Position: Lead Operator & Data Manager
Affiliation: Hoefler Consulting Group, Inc.

Name: Isaac Bertschi
Position: Data Management
Affiliation: Hoefler Consulting Group, Inc.

6.5 Data Capture

- Identify the desired data capture rate for the monitoring data.

Target rate for PSD Quality Meteorological Monitoring Data is 90%.

Is the desired data capture rate being met for each data type?	■ Yes □ No	Comments: None.

6.6 Data Reporting

Are quarterly and annual data reports being submitted for the site?	■ Yes □ No	Comments: None
Are qualified staff personnel reviewing data reports prior to submittal?	■ Yes □ No	Comments: None.
Is finalized data set submitted with report to ADEC?	■ Yes □ No	Comments: None.

7.0 QUALITY ASSURANCE AND QUALITY CONTROL

7.1 Quality Assurance Program

Has a quality assurance plan been written describing quality assurance procedures?	■ Yes □ No	Comments: None.
Is a copy of the plan available to field and data processing personnel?	■ Yes □ No	Comments: None.
Has the quality assurance plan been approved by the ADEC?	■ Yes □ No	Comments: None.

- Identify those person(s) responsible for updating the plan SOPs.

Name: Steve Mackey
Position: Project Manager
Affiliation: Hoefler Consulting Group, Inc.

7.2 Quality Assurance Methods and Audits

Have adequate audit procedures been identified within the quality assurance plan?	■ Yes □ No	Comments: None.
Does the Plan correctly document PSD accuracy limits for calibrating and auditing?	■ Yes □ No	Comments: None.
Have audits been conducted on the suggested schedule of every six months?	■ Yes □ No	Comments: None.

- Identify the person(s) responsible for conducting audits on the monitoring instrumentation.

Name: Eric Brudie
Position: Field Auditor
Affiliation: Hoefler Consulting Group, Inc.

8.0 COMMENTS AND SUGGESTIONS

- Prepare and compile site specific station checklists and visit forms.

APPENDIX B
PERFORMANCE AUDIT DATA SHEETS and ALIGNMENT MAP

METEOROLOGICAL STATION - INSTRUMENT PERFORMANCE AUDIT (11-M)

Owner: Northern Dynasty **Operator:** Dominic Shallies **Alternate:** Steve Mackey **Station Site:** Port
Auditor: Eric Brudie **Witness(s):** Dominic Shallies **Audit Date:** 21-Aug-06

● *DAS TIME AUDIT*

PSD Limits: DAS time = Alaska Standard Time (AST) +/- 5 minutes.
Conversions: Winter; (AST) = (DST), Summer; (AST) = (DST) - 1 hr.
Comments: None.

DAS TIME vs. NOAA CLOCK			
AST Time	DAS Time	Error Min:Sec	Pass/ Fail?
16:54:30	16:54:37	**00:07**	**PASS**

This Instrument was calibrated using Instruments Traceable to National Institute of Standards and Technology.

A Test Uncertainty Ratio of at least 4:1 is maintained unless otherwise stated and is calculated using the expanded measurement uncertainty. Uncertainty evaluation includes the instrument under test and is calculated in accordance with the ISO "Guide to the Expression of Uncertainty in Measurement" (GUM). The uncertainty represents an expanded uncertainty using a coverage factor k=2 to approximate a 95% confidence level. In tolerance conditions are based on test results falling within specified limits with no reduction by the uncertainty of the measurement. The results contained herein relate only to the item calibrated. This certificate shall not be reproduced except in full, without written approval of Control Company.

Nominal=Standard's Reading; As Left=Instrument's Reading; In Tol=In Tolerance; Min/Max=Acceptance Range; ±uc=Measurement Uncertainty; TUR=Test Uncertainty Ratio; Accuracy=±(Max-Min)/2

Wallace Berry

Wallace Berry, Technical Manager

Maintaining Accuracy:

In our opinion once calibrated your Digital Thermometer should maintain its accuracy. There is no exact way to determine how long calibration will be maintained. Digital Thermometers change little, if any at all, but can be affected by aging, temperature, shock, and contamination.

Recalibration:

For factory calibration and re-certification traceable to National Institute of Standards and Technology contact Control Company.

Certificate of Calibration

Report #: 101705-X0740015-RH **RMA #:** 95-49728 **Calibration Date:** Oct-17-2005
Model #: HMI41/HMP45 **Serial #:** X0650080 / X0740015
Instrument Type: Humidity Transmitter Calibration Procedure: 11603100
Instrument Range: 0 to 100%RH Recommended Calibration Due Date: Oct-17-2006

Customer: HOEFLER CONSULTING GROUP
City, State: ANCHORAGE, AK

This unit was calibrated by adjusting its reading at 0%* against a dry-air line and at 75% against reference humidity and temperature instrument, Vaisala model HMP233. Additional instrument verification checkpoints were made against HMP233 reference at 11%RH, 33%RH and 97%* RH. Calibration and instrument verification sequences utilize a dry-air line and a set of controlled aqueous salt solutions Vaisala model HMK13B. Laboratory ambient conditions are humidity and temperature controlled. The calibration uncertainty is presented at 95% confidence level, k=2. The standard uncertainty of the measurement has been determined in accordance with U.S. Guide to the Expression of Uncertainty in Measurement. *Note: the 0% and 97% RH points are not ISO17025 Accredited.

CERTIFICATE OF CALIBRATION

WORK ORDER NO. 8884 **TRACEABILITY CERTIFICATE NO.** 05090203

ISSUED TO: Hoefler Consulting Group

INSTRUMENT: 366-3, .003-.03 Inch Ounces Torque Watch, Waters Manufacturing, Inc, S/N 4864

DATE DONE: September 02, 2005 **DATE DUE:** September 01, 2006

CERTIFIED BY METROLOGIST: E.P. Young E.P. Young **TEMPERATURE:** 72 °F **HUMIDITY:** 43% RH

INCOMING STATUS: This instrument was in (XX) was out of ( ) tolerance when received.

PROCEDURE/LIMITATIONS/ACCURACY STATEMENT: T.O. 33k6-4-2630-1. Accuracy: +/- 10 % of Full Scale.

COMPLIANCE

Alaska Calibration, Inc.'s calibration practices and procedures comply with the requirements of ANSI/SO/Z540-1 and ANS/ ISO/IEC17025: 2000 and relevant requirements of ISO 9002: 1994. The standards used are certified as being traceable to the National Institute of Standards and Technology (NIST), by comparison to SI units through laboratory standards in an unbroken chain of calibrations through appropriate primary and national measurement standards, derived from an acceptable value of a natural physical constant, or derived by the ratio type of self calibration techniques. This Certificate shall not be reproduced, except in full, without the written approval of Alaska Calibration, Inc.

STANDARDIZATION OF EPPLEY PRECISION SPECTRAL PYRANOMETER Model PSP

Serial Number: 34377F3

Resistance: 603 Ω at 23 °C
Temperature Compensation Range: -20 to 40 °C

This radiometer has been compared with Standard Precision Spectral Pyranometer, Serial Number 21231F3 in Eppley's Integrating Hemisphere under radiation intensities of approximately 700 watts meter^{-2} (roughly one-half a solar constant). The adopted calibration temperature is 25 °C.

As a result of a series of comparisons, it has been found to have a sensitivity of:

9.33×10^{-6} volts/watts meter^{-2}

The calculation of this constant is based on the fact that the relationship between radiation intensity and emf is rectilinear to intensities of 1400 watts meter^{-2}. This radiometer is linear to within ± 0.5% up to this intensity.

The calibration of this instrument is traceable to standard self-calibrating cavity pyrheliometers in terms of the Systems Internationale des Unites (SI units), which participated in the Ninth International Pyrheliometric Comparisons (IPC IX) at Davos, Switzerland in September-October 2000.

Useful conversion facts: 1 cal cm^{-2} min^{-1} = 697.3 watts meter^{-2}
1 BTU/ft^2-hr^{-1} = 3.153 watts meter^{-2}.

B AUDIT EQUIPMENT CALIBRATION CERTIFICATES

1.0 INTRODUCTION

Hoefler Consulting Group, Inc. (HCG) operates meteorological monitoring stations for Northern Dynasty Mines, Inc. (NDM) in support of the Pebble Mine Project near Iliamna, Alaska. The air monitoring program is one component of ongoing baseline environmental studies being conducted to support mine permitting, mine design and mine transportation infrastructure development. The stations meet Prevention of Significant Deterioration (PSD) guidelines, although PSD permits may not be required. This report covers the Port 1 monitoring station located near a potential mine port site.

The Port 1 station is located on the west shore of Iniskin Bay, near the southern end of the bay. The station is situated on a 50' high knoll, very near the water's edge. The Port 1 station consists of an instrumented 11-meter sectional tower secured with three guy wires. Approximately 20' south of the tower is a 6' by 8' insulated building which houses the datalogger and power supply system. The Pebble Port 1 station is instrumented with PSD quality sensors monitoring the following parameters:

- Ambient Temperature (ºC): Met One 062MP Thermistor Probe at 2-m
- Temperature Difference (ºC): Met One 062MP Thermistors at 2-m and 10-m
- Relative Humidity (%RH): Vaisala HMP45AC Relative Humidity Sensor
- Wind Speed 1 (m/s): Climatronics F460 P/N 100075 Wind Speed Sensor
- Wind Direction 1 (°): Climatronics F460 P/N 100076 Wind Direction Sensor
- Wind Speed 2 (m/s): RM Young 05305 Wind Monitor-AQ
- Wind Direction 2 (°): RM Young 05305 Wind Monitor-AQ
- Sigma Theta (°): Campbell Scientific CR10X DAS calculated (Yamartino)
- Barometric Pressure (mbar): Vaisala PT101B Barometric Pressure Sensor
- Solar Radiation (W/m2): LI-COR Li-200SX Solar Radiation Pyranometer.

This report has been prepared for NDM to serve as a quantitative review of the Pebble Port 1 station. To that end, a Performance Audit was undertaken in order to demonstrate that the equipment installed at the meteorological monitoring station is operating correctly and meets the requirements set forth by the U.S. Environmental Protection Agency (EPA) and the Alaska Department of Environmental Conservation (ADEC).

2.0 PERFORMANCE AUDIT

2.1 Performance Audit Methodology

During the performance audit, the station datalogger is interfaced with a portable laptop computer to display the outputs for the meteorological sensors. The value of each meteorological sensor is compared to the output value from the appropriate piece of audit equipment or from calibrated instruments collocated with the sensor. The difference between the station's datalogger reading and the output from each audit instrument is compared with established PSD limits to determine the accuracy of each sensor. Additionally, threshold torques for wind speed and wind direction are measured with audit equipment and compared with manufacturer torques corresponding to the PSD threshold speed of 0.5 m/s. Table 2-1 provides a summary of the performance audit methods and limits used to audit each parameter at the stations.

Table 2-1 Performance Audit Methods and Acceptable Limits

Parameter	Audit Method	EPA/Manufacturer Limit
Datalogger Time	NOAA Clock	≤ ±5:00 minutes from AST
Temperature Accuracy	Collocated NIST thermistor	≤ ±0.5 °C
Temperature Difference	Collocated NIST thermistor	≤ ±0.1 °C
Relative Humidity	Collocated NIST RH sensor	≤ ±1.5 °C of dew point
Wind Speed Accuracy	Synchronous rpm motor	≤ ±0.2 m/s + 5 % observed
Wind Spd Torque (Clim)	Torque watch	≤ 0.35 g-cm (0.0049 oz-in)
Wind Spd Torque (RMY)	Torque watch	≤ 1.0 g-cm (0.014 oz-in)
Wind Direction Alignment	GPS, compass or landmark	≤ ±5° from true azimuth
Wind Direction Accuracy	Linearity tester	≤ ±5° per audit point
Wind Direction Linearity	Linearity tester	≤ 3° mean absolute average
Wind Dir Torque (Clim)	Torque watch	≤ 7.5 g-cm (0.104 oz-in)
Wind Dir Torque (RMY)	Vane torque gauge	≤ 11 g-cm (0.153 oz-in)
Barometric Pressure	Collocated NIST BP sensor	≤ ±3 mbar
Solar Radiation	Collocated NIST sensor	≤ ±5% of input+resolutuion[1]

1. This audit limit is modified from PSD standard, as discussed below.

2.1.1 Data Acquisition System

An audit of the datalogger is conducted by comparing all datalogger outputs to the audit standards, as described below. The datalogger time is checked against an instantaneous time reading from the National Oceanic and Atmospheric Administration (NOAA) clock in Boulder, Colorado, via a global positioning system (GPS) handheld unit or telephone contact with the NOAA clock.

2.1.2 Air Temperature and Air Temperature Difference

The 2-meter and 10-meter thermistors are removed from their aspirator shields and collocated with a National Institute of Standards and Technology (NIST) traceable digital thermometer. The station thermistors and the transfer standard NIST thermometer are taped together and immersed in insulated thermoses containing a series of fluid baths; hot water (35°C to 45°C), warm water (15°C to 25°C), water/ice bath (0°C), cold glycol (-15°C to -25°C) and very cold glycol (-35°C to -45°C). Dry ice is used to cool the glycol baths. Each liquid bath is agitated and allowed to equilibrate before simultaneous readings are taken from the three instruments.

An alternate method can also be used for the low temperature audits, employing a Thermal Mass Device (TMD). The TMD consists of a 6” diameter by 9” high solid aluminum block milled to fit snuggly inside of an insulated Dewar flask. On the top of the TMD, and in corresponding locations on the flask lid, are holes sized to accommodate a variety of Campbell, Climatronics, Met-One and VWR thermistors. The TMD is cooled to the target temperatures by contact with dry ice and then placed in the insulated flask. The audit and station thermistors are inserted through the flask lid and into the appropriate holes in the TMD. After the TMD and the thermistors are allowed to equilibrate, readings for all thermistors are simultaneously taken. The aluminum TMD has a very high thermal conductivity and when allowed to equilibrate inside of the insulated flask, thermal gradients across the TMD are very small.

In all cases, the difference between the individual station thermistors and the NIST standard are compared to the PSD temperature accuracy limit of ±0.5°C. The difference between the two station thermistors (10-m°C minus 2-m°C) is compared to the PSD temperature difference limit of ±0.1°C.

2.1.3 Relative Humidity

Relative humidity (RH) is audited using a collocated NIST traceable RH sensor. The NIST sensor and the field sensor are collocated out of direct sunlight to eliminate solar radiation effects, preferably inside of the motor aspirated shield. If the NIST standard reads directly in dew point °C, those readings are used; if not, relative humidity and

temperature readings are used. For the audit; instantaneous readings of dew point, relative humidity and ambient temperature are recorded from the transfer standard and the DAS. All relative humidity and temperature readings are converted to dew point in order to assess the PSD error limit of ±1.5°C dew point.

2.1.4 Wind Speed

Anemometers are audited to determine their accuracies in reading known wind speeds and to ascertain the sensor's threshold torque. The Climatronics and RM Young sensors are audited in very similar manners and are discussed together. The instruments are tested after removal from the tower and after removal of the sensor's props or cups.

First, an RM Young synchronous motor is attached to the shaft of the anemometer by using brand specific coupling devices. The sensor shaft is rotated at several different known revolutions per minute (rpm). Each rotational speed in rpm is equated to a wind speed in meters per second (m/s) by using the anemometer manufacturer's linear calibration formula. The difference between the calculated input speed in m/s and the datalogger output is compared to established PSD limits for each input rpm.

Next, a high precision torque watch is attached to the shaft of the anemometer, once again using custom couplings. Torque readings are made in both directions in each quadrant along the axis of rotation of the shaft. The maximum reading is recorded for the torque required to turn the shaft of the anemometer. The torque value recorded during the audit is compared to manufacturer's torque corresponding to the minimum PSD threshold speed of 0.5m/s.

2.1.5 Wind Direction

The wind direction sensors are first audited as-found to determine the accuracy of their alignment with respect to true north (true azimuth alignment) using one of four methods. In one method, a handheld GPS unit is used to measure the position of the auditor with respect to a waypoint captured under the wind sensor's position on the tower. Using binoculars, the tail of the wind vane is aligned with the auditor's position at a distance of several hundred feet from the tower. The GPS bearing back to the tower waypoint is then compared to the DAS reading. The difference between the two should not exceed ±5° per audit point. This procedure is repeated at least 4 times, once per quadrant, generally near the cardinal directions. The second method uses a calibrated precision compass mounted on a gimbal and tripod. The compass declination is preset for the specific location and date using one of a variety of magnetic declination computer models. The sensor tail is aligned toward the auditor while auditor sights the

compass toward the sensor and readings are taken in a similar manner to the GPS method.

Another option is to align the tail of the sensor with a distant identifiable landmark of know bearing. The bearing to the landmark may be ascertained using a variety of methods. One method involves physically capturing a distant GPS waypoint, such as at a discernable structure or emissions stack. Bearings to inaccessible natural landmarks, usually distant mountain peaks, are acquired through the use of various computer mapping programs, such as Natural Geographic's TOPO program or USGS digital raster graphics (DRGs) loaded into AutoCAD. The bearing from the station location to the landmark is compared to the DAS reading. This method yields the most accurate audit value, but is limited by weather and availability of discernable landmarks. The final method is to align the vane with the tower guy wires or preset survey markers, whose bearing has been ascertained using precision survey equipment.

The wind direction accuracy and linearity are subsequently audited after the wind direction sensor is removed from the tower. The Climatronics sensor is mounted on a Climatronics Model 101984 linearity tester and the RM Young sensor is mounted on an RM Young Model 18112 Vane Angle Bench Stand. Both test fixtures are keyed to their respective sensor and graduated from 0° to 360°. A series of readings starting at 30° and then clockwise in 30° increments are taken. The RM Young is read from 30° to 360° and the Climatronics is read from 30° to 540°. The Climatronics sensor is tested 180° past 360° in order to test the second potentiometer used in some DAS programming. Although not required, the Climatronics sensor is also tested with the vane attached in order to ascertain sensor accuracy and linearity relative to the instrument crossarm. The vane is aligned along the axis of the crossarm to yield the 0°/360° and 180° values and against a square held to the crossarm for the 90° and 270° directions. Four readings are taken in a clockwise direction and four are taken counterclockwise to complete the test. For both the linearity test fixture and crossarm tests, individual error values are assessed for the PSD accuracy limit of ±5° per point and the mean absolute average error is assessed against the linearity limit of 3°.

Next, the RM Young wind direction threshold is tested by measuring wind vane torque using an RM Young Model 18331 Vane Torque Gauge. This device saddles the wind vane and a calibrated spring is pulled to determine maximum torque from readings taken in both directions in all four quadrants. The Climatronics wind direction starting torque is measured with the vane removed by using a precision torque watch in the same manner as the wind speed torque. The highest torque readings are compared to specific manufacturer limits for instrument staring torque.

Finally, the wind direction sensors are placed back on the tower and as-left audits of the azimuth alignments are conducted to ensure the instruments are properly reinstalled.

2.1.6 Barometric Pressure

Barometric pressure (BP) is audited using a collocated NIST traceable BP sensor. The difference between the NIST sensor and the station sensor are compared to the PSD limit of ±3 mbar.

2.1.7 Solar Radiation

Outputs of the station sensor are compared to the output of a level collocated audit solar radiation sensor. The audit sensor is connected to an independent audit datalogger with the scan interval and clock synchronized with the station DAS. Hourly average solar radiation readings and instantaneous readings are recorded during the audit and then input into a custom spreadsheet to calculate a linear regression for the data. The PSD limit for solar radiation audits is ±5% of observed, but this standard is very difficult to obtain at the northern latitude of this installation. This EPA standard is currently undergoing review and is expected to change. A well excepted substitute is that individual DAS and audit data pairs are compared to a limit of ±5% of observed **+ EPA minimum instrument resolution (10W/m²)**. Individual data pairs are evaluated against this standard, but the overall set is restricted to a 5% error by limiting allowable linear slope to 1.0±0.05.

2.2 Performance Audit Results

The performance audit was conducted at the Port 1 station on January 16, 2007, with Dominic Shallies of HCG assisting. All sensors were challenged with certified audit equipment and all except the RM Young wind sensor yielded errors below the PSD limits. The 2-meter aspirator fan also was not operating upon arrival at the site, but was repaired during the audit. On February 7, 2007 the RM Young sensor and the aspirators were replaced and a supplemental audit was conducted.

Table 2-2 contains summary data from the January 2007 audit and Table 2-3 summarizes the February 2007 supplemental performance audit. Complete audit reports and audit equipment calibration certificates are contained in Appendix A and Appendix B respectively.

2.3 Performance Audit Recommendations

- Set up DAS to monitor aspirator fan amperage.

Table 2-2 Port 1 January 16, 2007 Performance Audit Summary

Parameter	Limit	Units	Max Err	Status

This Instrument was calibrated using Instruments Traceable to National Institute of Standards and Technology.

A Test Uncertainty Ratio of at least 4:1 is maintained unless otherwise stated and is calculated using the expanded measurement uncertainty. Uncertainty evaluation includes the instrument under test and is calculated in accordance with the ISO "Guide to the Expression of Uncertainty in Measurement" (GUM). The uncertainty represents an expanded uncertainty using a coverage factor k=2 to approximate a 95% confidence level. In tolerance conditions are based on test results falling within specified limits with no reduction by the uncertainty of the measurement. The results contained herein relate only to the item calibrated. This certificate shall not be reproduced except in full, without written approval of Control Company.

Nominal=Standard's Reading; As Left=Instrument's Reading; In Tol=In Tolerance; Min/Max=Acceptance Range; ±uc=Measurement Uncertainty; TUR=Test Uncertainty Ratio; Accuracy=±(Max-Min)/2

Wallace Berry

Wallace Berry, Technical Manager

Maintaining Accuracy:

In our opinion once calibrated your Digital Thermometer should maintain its accuracy. There is no exact way to determine how long calibration will be maintained. Digital Thermometers change little, if any at all, but can be affected by aging, temperature, shock, and contamination.

Recalibration:

For factory calibration and re-certification traceable to National Institute of Standards and Technology contact Control Company.

VAISALA

Certificate of Calibration

Report #: 112006-X0740015-RH **RMA #:** 95-56707 **Calibration Date:** Nov-20-2006
Model #: HMI41/HMP45 **Serial #:** X0650080/X0740015
Instrument Type: Humidity Transmitter Calibration Procedure: 11603100
Instrument Range: 0 to 100%RH, -20 to 60°C, Temp. Recommended Calibration Due Date: Nov-20-2007

Customer: HOEFLER CONSULTING GROUP
City, State: ANCHORAGE, AK USA

This unit was calibrated by adjusting its reading at 0%* against a dry-air line and at 75% RH against reference humidity and temperature instrument, Vaisala model HMP233. Additional instrument verification checkpoints were made against HMP233 reference at 11% and 97%* RH. Calibration and instrument verification sequences utilize a dry-air line and a set of controlled aqueous salt solutions Vaisala model HMK13B Laboratory ambient conditions are humidity and temperature controlled. The calibration uncertainty is presented at 95% confidence level, k=2. The standard uncertainty of the measurement has been determined in accordance with U S Guide to the Expression of Uncertainty in Measurement *Note: the 0% and 97% RH points are not ISO17025 Accredited

Certificate of Calibration and Testing

Test Unit:			
Model:	18811	Serial Number:	CA02136
Description:	Anemometer Drive - 20 to 990 RPM - Comprised of Models 18820A Control Unit & 18831A Motor Assembly		

R.M. Young Company certifies that the above equipment has been inspected and calibrated using standards whose accuracies are traceable to the National Institute of Standards and Technologies (NIST).

Nominal Motor Rpm	27106D Output Frequency Hz (1)	Calculated Rpm (2)	Indicated Rpm (3)
30.0	5	30.0	30.0
150.0	25	150.0	150.0
300.0	50	300.0	300.0
450.0	75	450.0	450.0
600.0	100	600.0	600.0
750.0	125	750.0	750.0
990.0	165	990.0	990.0
☑ Clockwise and Counterclockwise rotation verified			

(1) Measured frequency output of RM Young Model 27106D standard anemometer attached to motor shaft
(2) 27106D produces 10 pulses per revolution of anemometer shaft
(3) Indicated on the Control Unit LCD display

*Indicates out of tolerance

☑ No Calibration Adjustments Required ☐ As Found ☐ As Left

THE BRUNTON COMPANY
Certificate Of Calibration

Equipment Owner:
Name: DOMINIC SHALLIES

Address: 3401 MINNESOTA DR. STE # 300

City, State, Zip: ANCHORAGE, AK 99503

Calibration traceable to the National Institute of Standards and Technology in accordance with Mil-STD-45662A has been accomplished on the instrument listed below by comparison with standards maintained by The Brunton Co. The accuracy and stability of all standards maintained by The Brunton Co. are traceable to national standards maintained by the National Institute of Standards and Technology in Washington, D.C. and Boulder, CO. Complete record of all work performed is maintained by The Brunton Co. and is available for inspection upon request.

This Unit has been calibrated to Lietz TM10E serial number 30937 traceable to N.B.S. no. 738 227675 this 2ND Day of NOVEMBER 2006

DESCRIPTION: POCKET TRANSIT

PURCHASE ORDER: RA 7277

STANDARDIZATION OF EPPLEY PRECISION SPECTRAL PYRANOMETER Model PSP

Serial Number: 34377F3

Resistance: 603 Ω at 23 °C
Temperature Compensation Range: -20 to 40 °C

This radiometer has been compared with Standard Precision Spectral Pyranometer, Serial Number 21231F3 in Eppley's Integrating Hemisphere under radiation intensities of approximately 700 watts meter^{-2} (roughly one-half a solar constant). The adopted calibration temperature is 25 °C.

As a result of a series of comparisons, it has been found to have a sensitivity of:

$$9.29 \times 10^{-6} \text{ volts/watts meter}^{-2}$$

The calculation of this constant is based on the fact that the relationship between radiation intensity and emf is rectilinear to intensities of 1400 watts meter^{-2}. This radiometer is linear to within ± 0.5% up to this intensity.

The calibration of this instrument is traceable to standard self-calibrating cavity pyrheliometers in terms of the Systems Internationale des Unites (SI units), which participated in the Ninth International Pyrheliometric Comparisons (IPC IX) at Davos, Switzerland in September-October 2000.

Useful conversion facts: 1 cal cm^{-2} min^{-1} = 697.3 watts meter^{-2}
1 BTU/ft^2-hr^{-1} = 3.153 watts meter^{-2}
