Key: **Bold Results** = Parameter undetected by test, value shown is 1/2 MDL or 1/2 MRL.
If result was not detected at the lab MDL, the value shown is 1/2 MDL.
If result was validation flagged U or UJ, the value shown is 1/2 MRL.
Green Results = Estimated result reported by laboratory below reporting limit (MRL).
Red Results = Result exceed applicable Chronic Aquatic Life Criteria and/or Drinking Water Standards.
MDL = Method Detection Limit.
MRL = Method Reporting Limit.
NA = Not Applicable.
CALC = ADEC Chronic Aquatic Life Criteria
DWS = Drinking Water Standards -18 AAC 70, Water Quality Standards, under fresh water uses, (6)(A)(i) and (6)(C).
ADEC = Alaska Department of Environmental Conservation
EPA = Environmental Protection Agency
WAD Cyanide = Weak Acid Dissociable Cyanide
mg/L = Milligrams per Litre (Parts per Pillion)
µg/L = Micrograms per Litre (Parts per Billion)

Footnotes: (1) CALC come from the ADEC Alaska Water Quality Criteria Manual – Table III and from the ADEC Water Quality Standards for Fresh Water Uses under use (C).
(2) DWS come from the ADEC Alaska Water Quality Criteria Manual – Table I, the ADEC Water Quality Standards under use (A)(i), and EPA Primary Drinking Water Standards.
(3) Total Ammonia CALC limit dependent on calculated upper 95th percentile of temperature and pH.
(4) Cadmium, Chromium III, Copper, Lead, Nickel and Zinc CALC limits are preliminary estimates and are dependent on Hardness lowest 5th percentile.
(5) Criterion given is for free cyanide. ADEC has determined that the WAD cyanide method is to be used for analysis and the result is to be applied to the free cyanide criterion.
(6) Criterion given is the more stringent of those avalable for chromium III and chromium VI. Analysis is of total chromium.
(7) The Criterion given for total mercury concentration is based on the Alaska Water Quality Criteria Manual for Toxic and Other Deleterious Organic and Inorganic Substances, 2002.
(8) Criterion given is an acute criterion, rather than a chronic criterion. No chronic aquatic life criterion has been established for silver.
(9) Precision displayed in values may be less than actual where unit conversions were necessary, esp. Hg, Si, B.

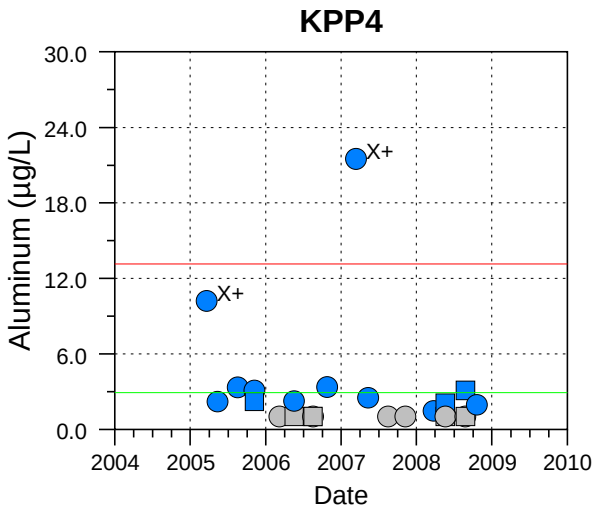
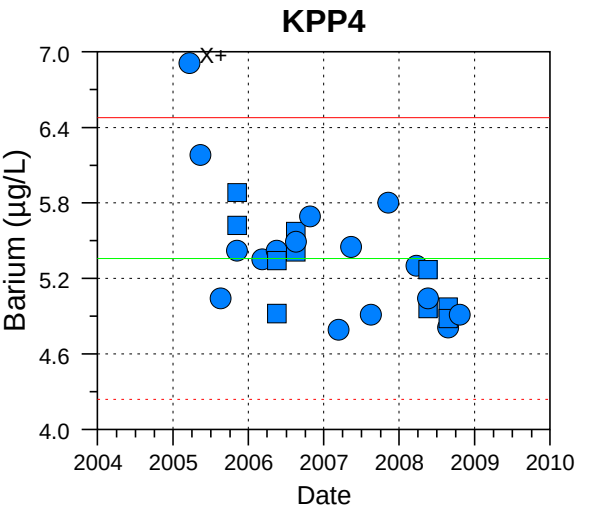
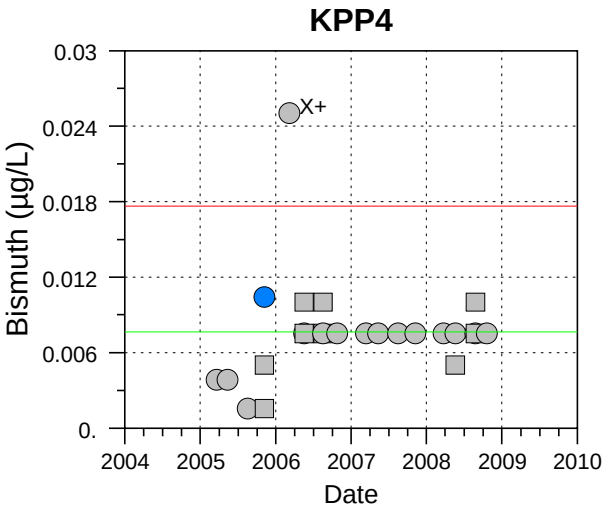
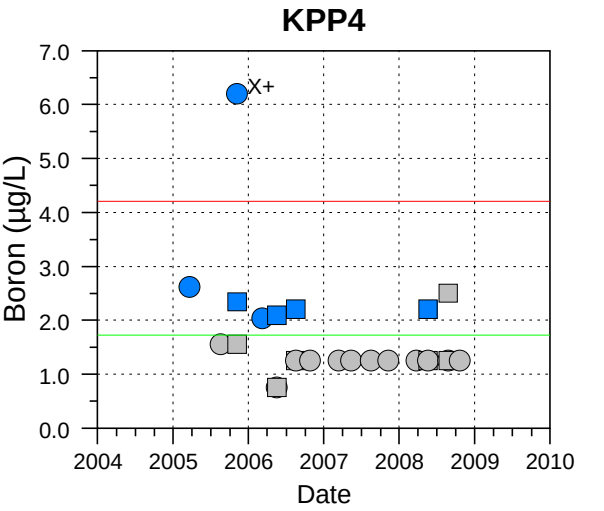
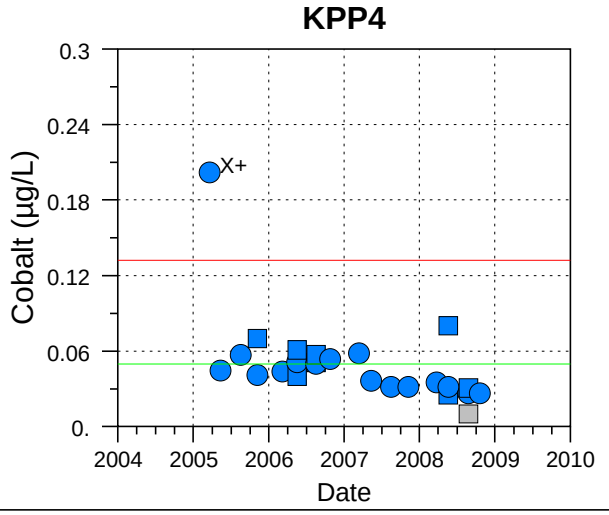
Table 9.2C-5: List of Outliers and Documented Elevated Values, Dissolved Concentrations 136
Table 9.2C-6: List of Outliers and Documented Elevated Values, Total Concentration 145

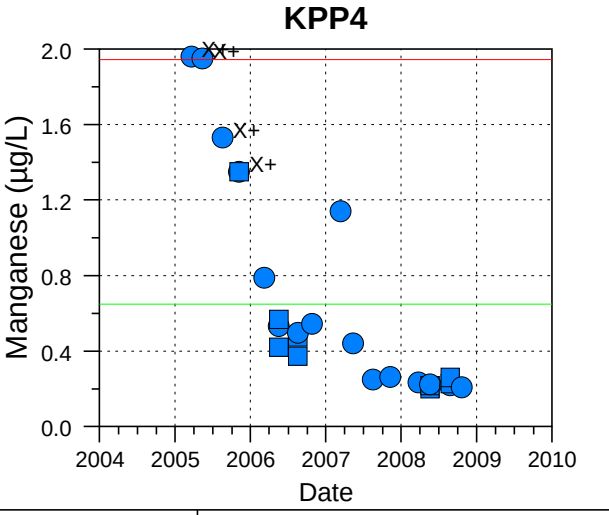












Legend

- Analytical Result
- Quality Control Sample Result
- Not Detected
- Upper 98% Confidence Level
- Mean
- Lower 98% Confidence Level

X+ outlier, very high value

Notes:
1. Non detect (ND) values are treated as values in the data analysis at 0.5 x MDL (Method Detection Limit) for unflagged data or 0.5 x MRL (Method Reporting Limit) in the case of U-flagged data (Data below the MRL).
2. Some non detect values were marked as outliers because they were significantly higher than other actual data values, and therefore would have skewed the data analysis.
3. KPP4: Example for monitoring well identification label
4. mg/L= milligrams per liter,
ug/L = micrograms per liter

X+ outlier, very high value

Notes:
1. Non detect (ND) values are treated as values in the data analysis at 0.5 x MDL (Method Detection Limit) for unflagged data or 0.5 x MRL (Method Reporting Limit) in the case of U-flagged data (Data below the MRL).
2. Some non detect values were marked as outliers because they were significantly higher than other actual data values, and therefore would have skewed the data analysis.
3. KPP4: Example for monitoring well identification label
4. mg/L= milligrams per liter,
ug/L = micrograms per liter

Notes:
1. Non detect (ND) values are treated as values in the data analysis at 0.5 x MDL (Method Detection Limit) for unflagged data or 0.5 x MRL (Method Reporting Limit) in the case of U-flagged data (Data below the MRL).
2. Some non detect values were marked as outliers because they were significantly higher than other actual data values, and therefore would have skewed the data analysis.
3. KPP4: Example for monitoring well identification label
4. mg/L= milligrams per liter,
ug/L = micrograms per liter

Notes:
1. Non detect (ND) values are treated as values in the data analysis at 0.5 x MDL (Method Detection Limit) for unflagged data or 0.5 x MRL (Method Reporting Limit) in the case of U-flagged data (Data below the MRL).
2. Some non detect values were marked as outliers because they were significantly higher than other actual data values, and therefore would have skewed the data analysis.
3. KPP4: Example for monitoring well identification label
4. mg/L= milligrams per liter,
ug/L = micrograms per liter

Notes:
1. Non detect (ND) values are treated as values in the data analysis at 0.5 x MDL (Method Detection Limit) for unflagged data or 0.5 x MRL (Method Reporting Limit) in the case of U-flagged data (Data below the MRL).
2. Some non detect values were marked as outliers because they were significantly higher than other actual data values, and therefore would have skewed the data analysis.
3. KPP4: Example for monitoring well identification label
4. mg/L= milligrams per liter,
ug/L = micrograms per liter

Notes:
1. Non detect (ND) values are treated as values in the data analysis at 0.5 x MDL (Method Detection Limit) for unflagged data or 0.5 x MRL (Method Reporting Limit) in the case of U-flagged data (Data below the MRL).
2. Some non detect values were marked as outliers because they were significantly higher than other actual data values, and therefore would have skewed the data analysis.
3. KPP4: Example for monitoring well identification label
4. mg/L= milligrams per liter,
ug/L = micrograms per liter

APPENDIX 9.2D

Ratio to Criteria for Laboratory Analytes for Individual Samples at each Groundwater Well, Mine Study Area 2004-2008

APPENDIX 9.2D
RATIO TO CRITERIA FOR LABORATORY ANALYTES FOR INDIVIDUAL SAMPLES AT EACH GROUNDWATER WELL, MINE STUDY AREA (2004-2008)

Appendix 9.2D Ratio to Criteria for Individual Samples at Each Groundwater Well, Mine Study Area (2004-2008)

Table of Contents

Ratios for Dissolved Concentrations (Filtered) for Parameters Al, Sb, As, Ba, Be, Cd, Cr, Cu, Fe, Pb, Mn, Hg, Mo at the Following Wells:

KPP4, MW10 1
MW11D, MW11M 2
MW11S, MW11SS 3
MW12D, MW12S 4
MW13D, MW13S 5
MW14D, MW14S 6
MW1D, MW1M, ... 7
MW1S, MW2D 8
MW3D, MW5D 9
MW5M, MW5S, ... 10
MW6D, MW7D, ... 11
MW7S, MW8D 12
MW8S, MW8M 13
MW9D,P0637D, P0637M 14
P0637S, P0638D, P0638M, P4S 15
PQ4, SRK2 16
SRK3, SRK5D 17
SRK5M, SRK5S 18

Ratios for Dissolved Concentrations (Filtered) for Parameters Ni, Se, Ag, Tl, V, Zn, Alkalinity, Cl, SO4, Pb, F, WAD CN, NH3, NO2, NO3 at the Following Wells:

KPP4, MW10 19
MW11D, MW11M 20
MW11S, MW11SS, MW12D 21
MW12S, MW13D, MW13S 22
MW14D, MW14S, MW1D 23
MW1M, MW1S 24
MW2D, MW3D 25
MW5D, MW5M 26
MW5S, MW6D 27
MW7D, MW7S 28
MW8D, MW8M 29
MW8S, MW9D, P0637D 30
P0637M, P0637S, P0638D, P0638M, P4S 31

PQ4, SRK2, SRK3 32
SRK5D, SRK5M 33
SRK5S 34

Ratios for Total Concentrations (Unfiltered) for Parameters Al, Sb, As, Ba, Be, Cd, Cr, Cu, Fe, Pb at the Following Wells:

KPP4, MW10 35
MW11D, MW11M 36
MW11S, MW11SS, MW12D 37
MW12S MW13D 38
MW13S MW14D, ... 39
MW14S, MW1D 40
MW1M, MW1S 41
MW2D, MW3D 42
MW5D, MW5M 43
MW5S, MW6D 44
MW7D, MW7S 45
MW8D, MW8M 46
MW8S, MW9D, ... 47
P0637D, P0637M, P0637S, P0638D, P0638M 48
P4S, PQ4, PW0810 49
PW089PT, SRK3 50
SRK5D, SRK5M 51
SRK5S 52

Ratios for Total Concentrations (Unfiltered) for Parameters Mn, Hg, Mo, Ni, Se, Ag, Tl, V, Zn at the Following Wells:

KPP4, MW10 53
MW11D, MW11M, ... 54
MW11S, MW11SS, MW12D 55
MW12S, MW13D 56
MW13S, MW14D 57
MW14S, MW1D 58
MW1M, MW1S 59
MW2D, MW3D 60
MW5D, MW5M 61
MW5S, MW6D 62
MW7D, MW7S 63
MW8D, MW8M 64
MW8S, MW9D 65
P0637D, P0637M, P0637S, P0638D, P0638M 66
P4S, PQ4, PW0810 67
PW089PT, SRK3 68
SRK5D, SRK5M 69
SRK5S 70

Abbreviations

1.	Ratio to Criteria	is the ratio of the sampled value divided by the water quality standard value.
2.	0.5	Ratio of detected value to criterion, black colour indicates that the detected values did not exceed the lowest criterion
3.	1.4	Ratio of detected value to criterion, red colour indicates that the detected values exceeded the lowest criterion
4.	-0.002	Ratio of non-detected value (0.5 x MDL) to the criterion, negative sign indicates non-detect
5.	-1.2	Ratio of non-detected value (0.5 x MDL) to the criterion, negative sign indicates non-detect, blue colour indicates that the (0.5 x MDL) exceeded the minimum criterion
6.	<empty>	Value was not measured or was flagged as an outlier
7.	ADEC	= Alaska Department of Environmental Conservation
8.	NFK	= North Fork Koktuli
9.	SFK	= South Fork Koktuli
10.	UT	= Upper Talarik
11.	µg/L	= micrograms per liter

APPENDIX 9.2E

Piper Plots for Groundwater Samples from Individual Wells, Mine Study Area 2004-2008

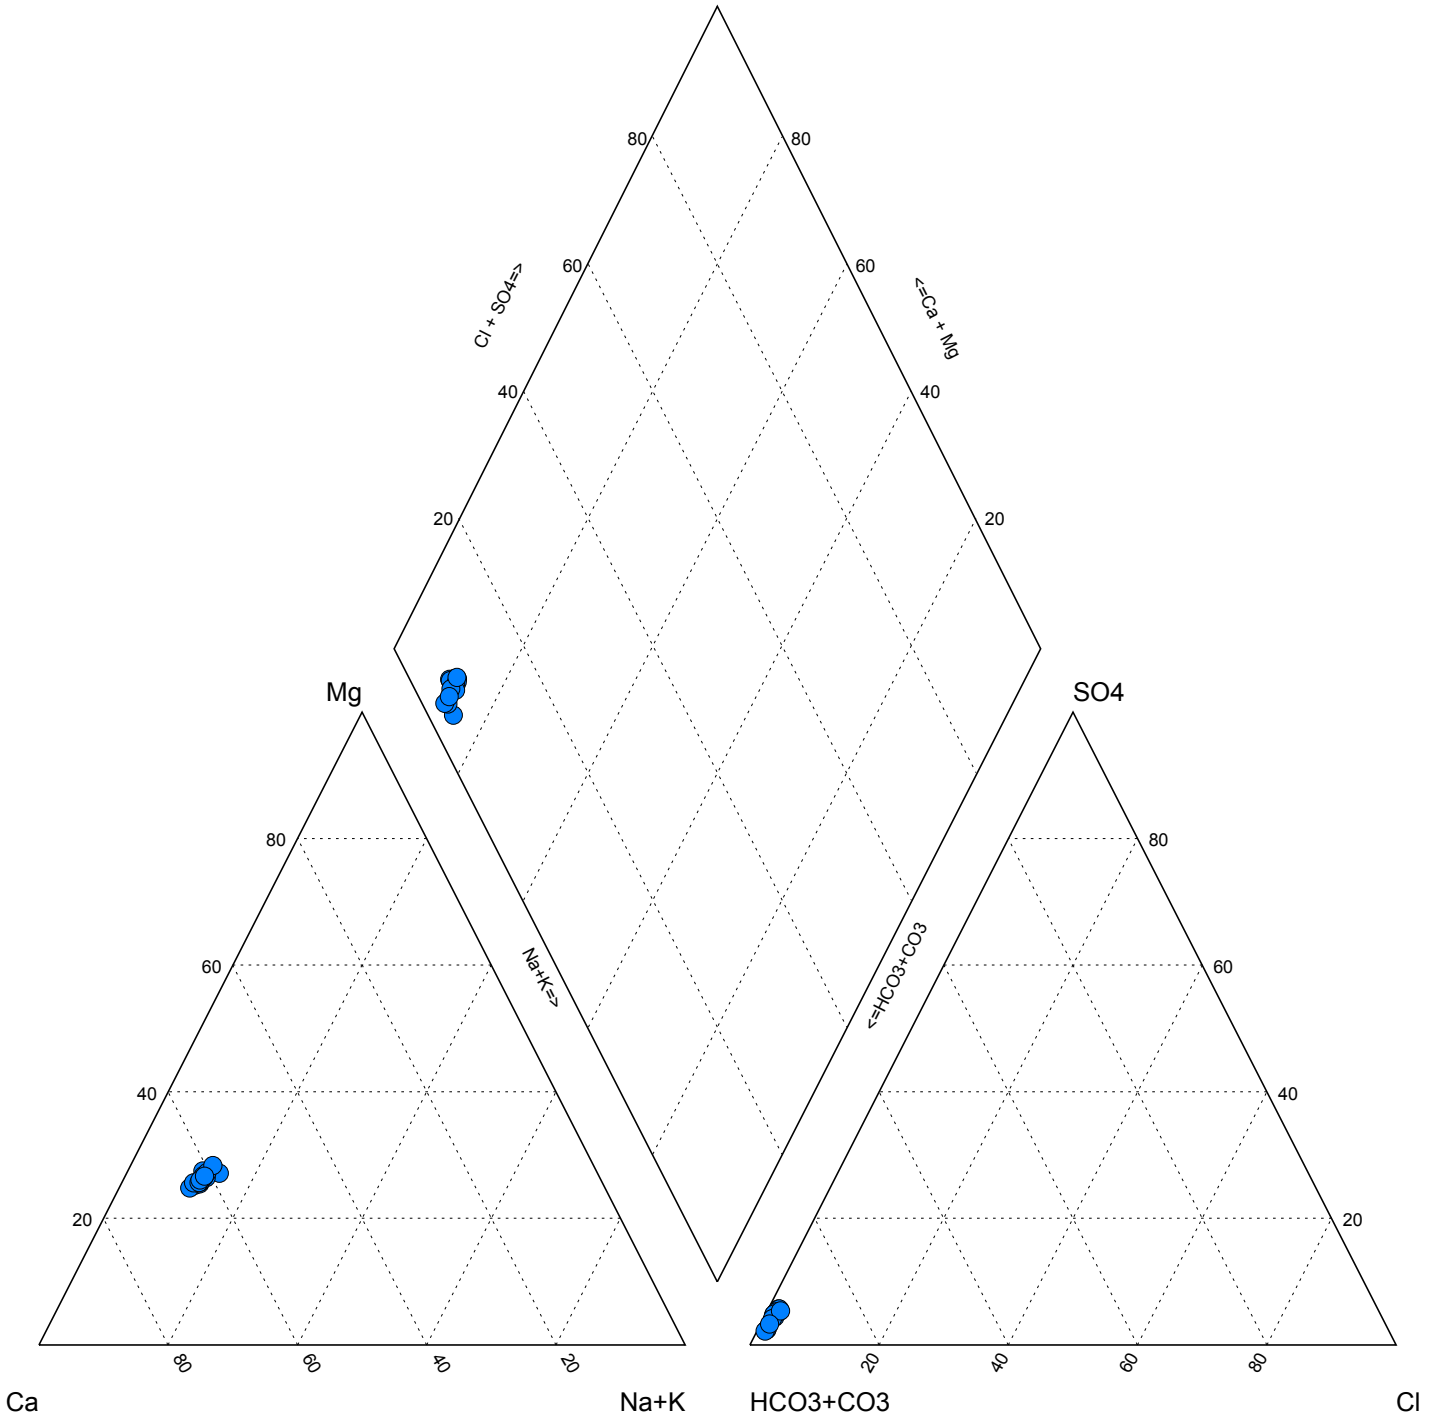
APPENDIX 9.2E
PIPER PLOTS OF GROUNDWATER SAMPLES FROM INDIVIDUAL WELLS, MINE STUDY AREA (2004-2008)

Appendix 9.2E - Piper Plots of Groundwater Samples from Individual Wells, Mine Study Area (2004-2008)

Table of Contents

Piper Plots for the Following Groundwater Monitoring Well Locations:

KP-P4 1
MW-10 2
MW-11D 3
MW-11M 4
MW-11S 5
MW-11SS 6
MW-12D 7
MW-12S 8
MW-13D 9
MW-13S 10
MW-14D 11
MW-14S 12
MW-1D 13
MW-1M 14
MW-1S 15
MW-2D 16
MW-3D 17
MW-5D 18
MW-5M 19
MW-5S 20
MW-6D 21
MW-7D 22
MW-7S 23
MW-8D 24
MW-8M 25
MW-8S 26
MW-9D 27
P-06-37D 28
P-06-37M 29
P-06-37S 30
P-06-38D 31
P-06-38M 32
P-4S 33
PQ-4 34
SRK-2 35
SRK-3 36
SRK-5D 37
SRK-5M 38
SRK-5S 39

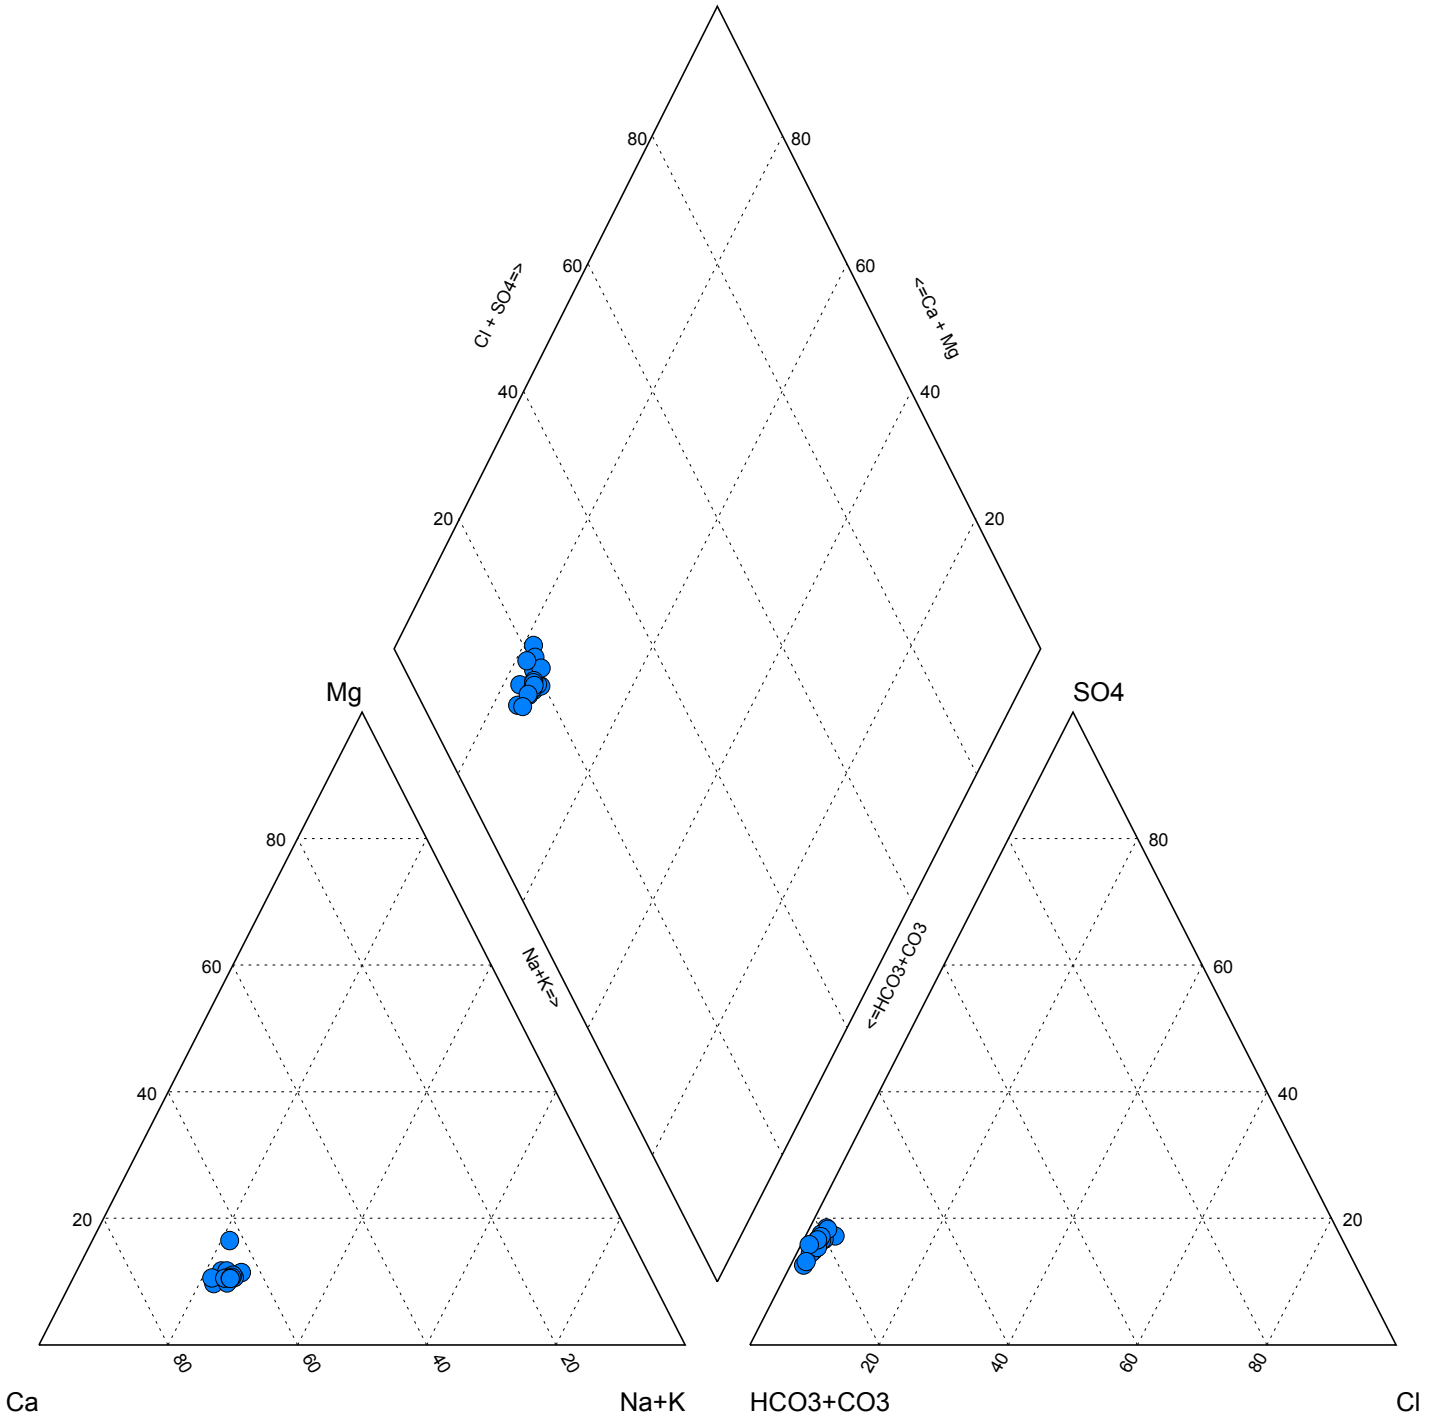


Notes:
1. The data set includes all results for individual samples for the years 2004-2008.
2. The axes of the Piper Plot indicate percentage of total milli-equivalents of ions.

THE pebble PARTNERSHIP

Appendix 9.2E
Piper Plot of Well KPP4

File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca

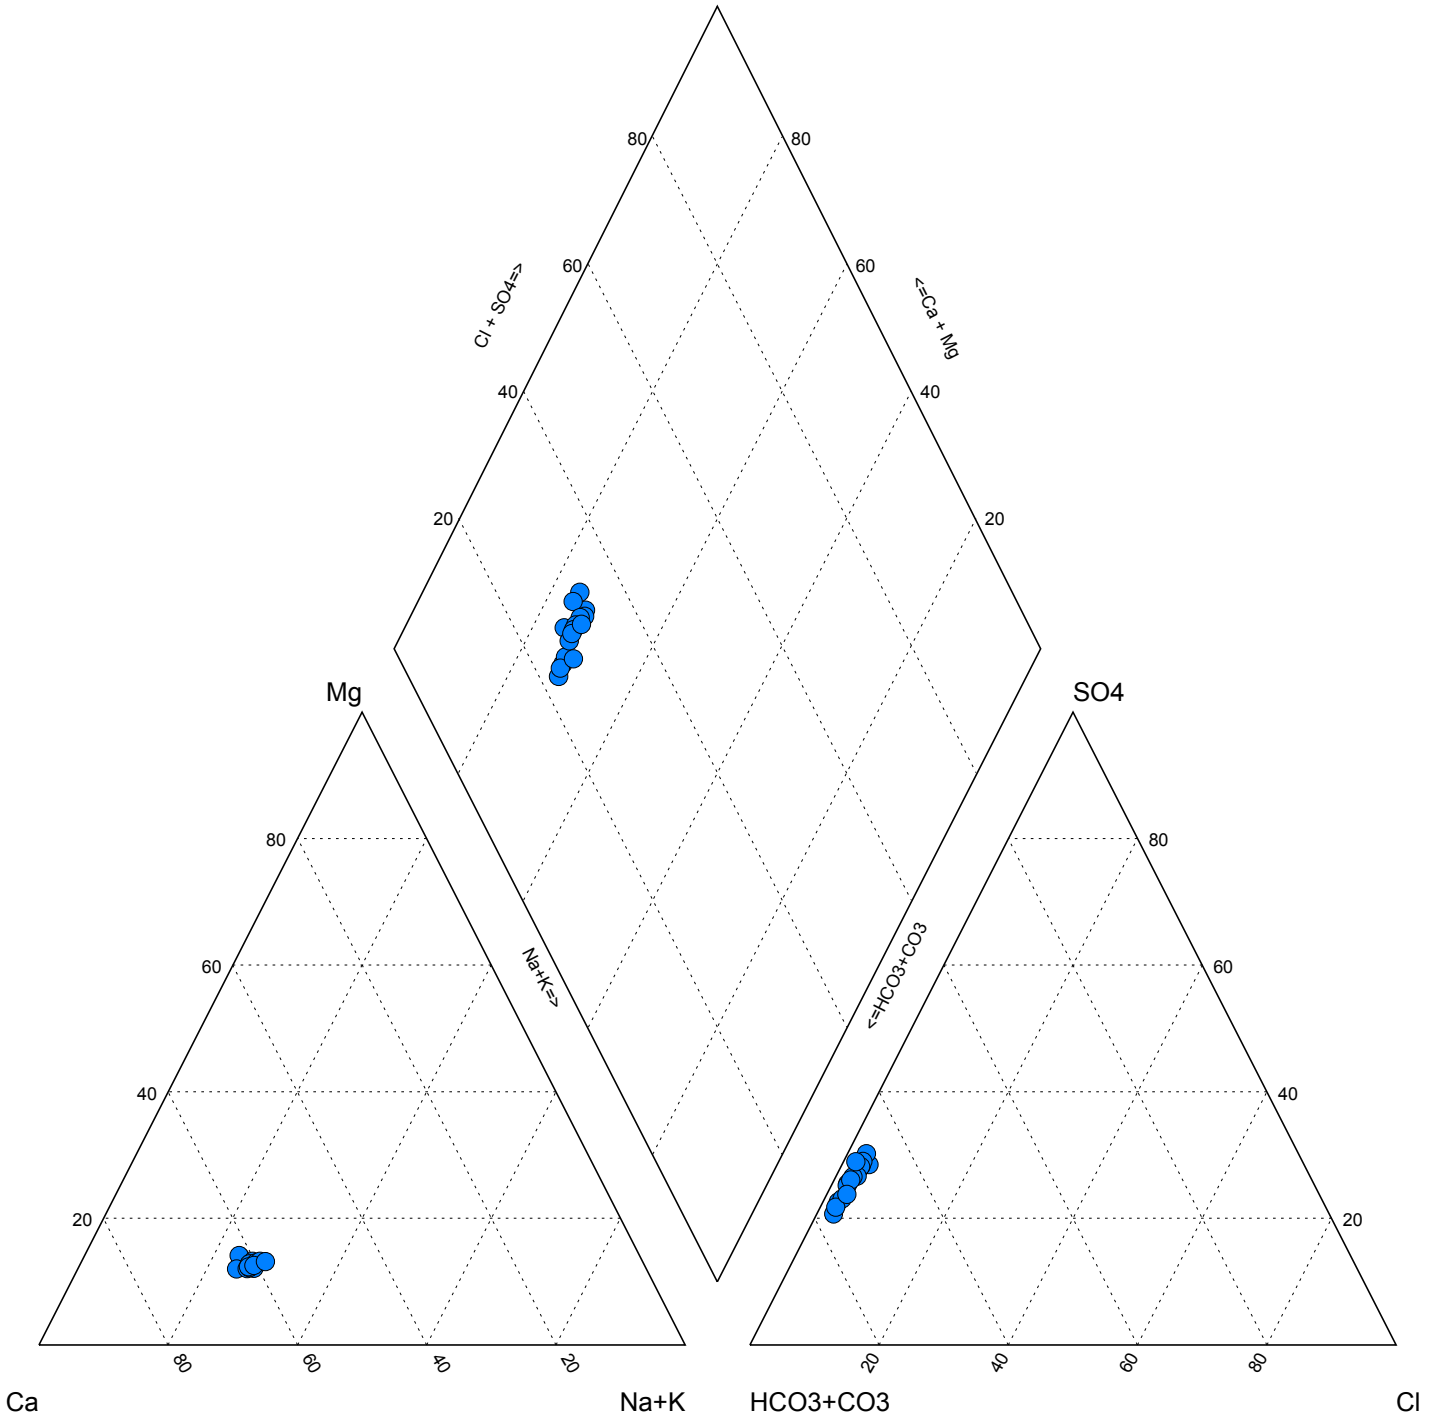


Notes:
1. The data set includes all results for individual samples for the years 2004-2008.
2. The axes of the Piper Plot indicate percentage of total milli-equivalents of ions.

THE pebble PARTNERSHIP

Appendix 9.2E
Piper Plot of Well MW10

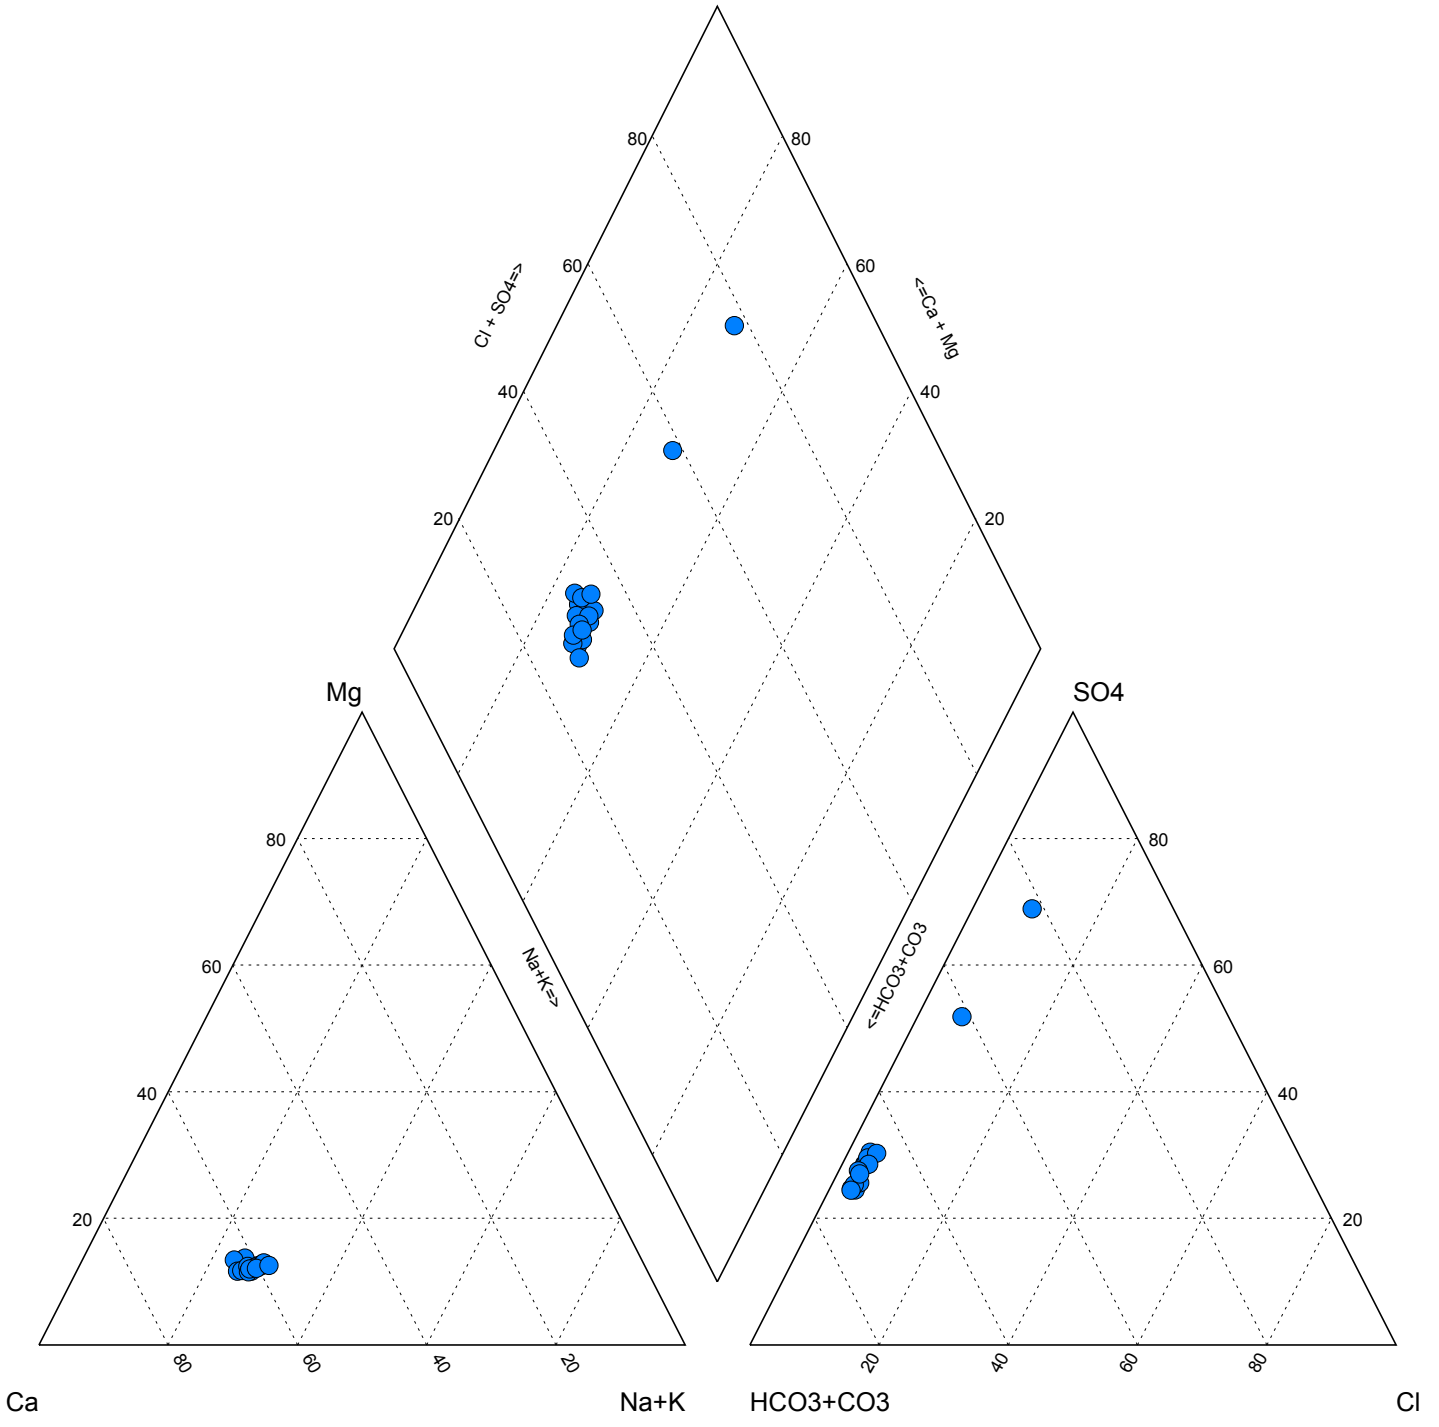
File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca



Notes:
1. The data set includes all results for individual samples for the years 2004-2008.
2. The axes of the Piper Plot indicate percentage of total milli-equivalents of ions.

Appendix 9.2E
Piper Plot of Well MW11D

File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca

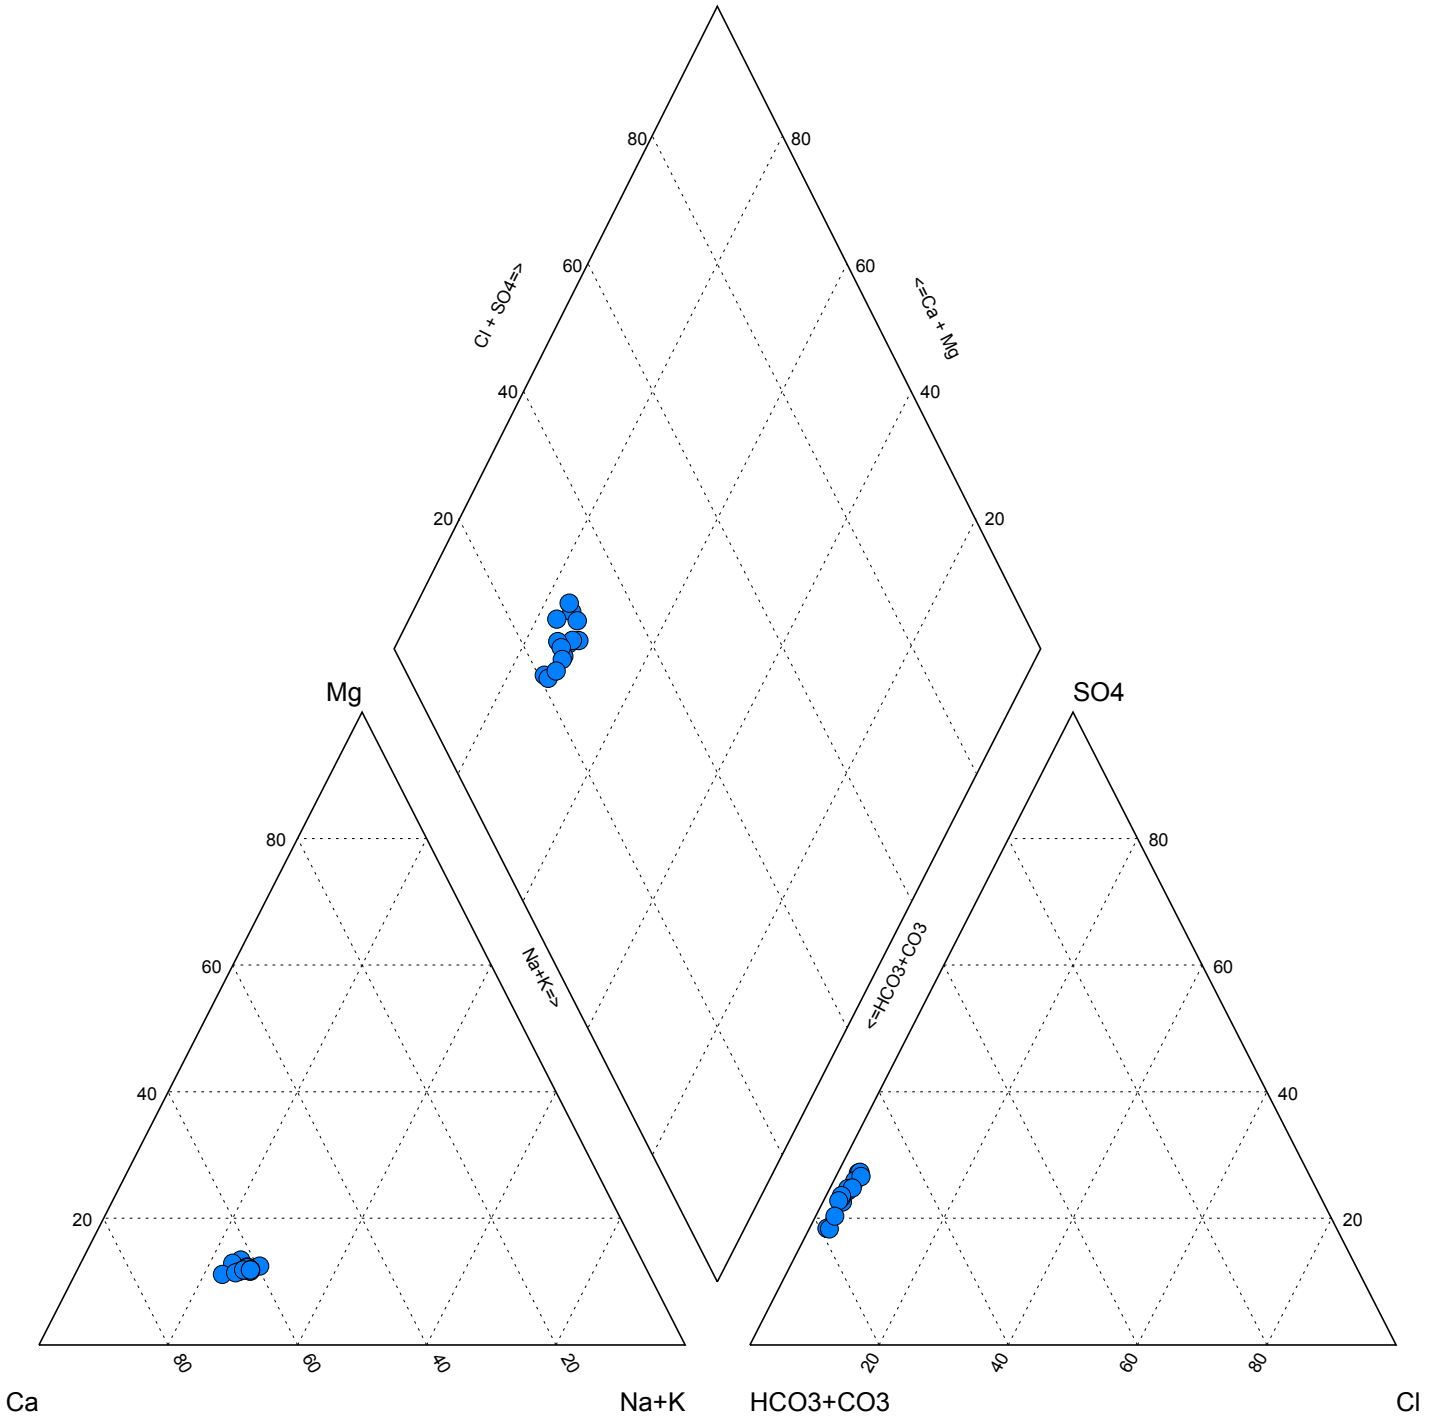


Notes:
1. The data set includes all results for individual samples for the years 2004-2008.
2. The axes of the Piper Plot indicate percentage of total milli-equivalents of ions.

THE pebble PARTNERSHIP

Appendix 9.2E
Piper Plot of Well MW11M

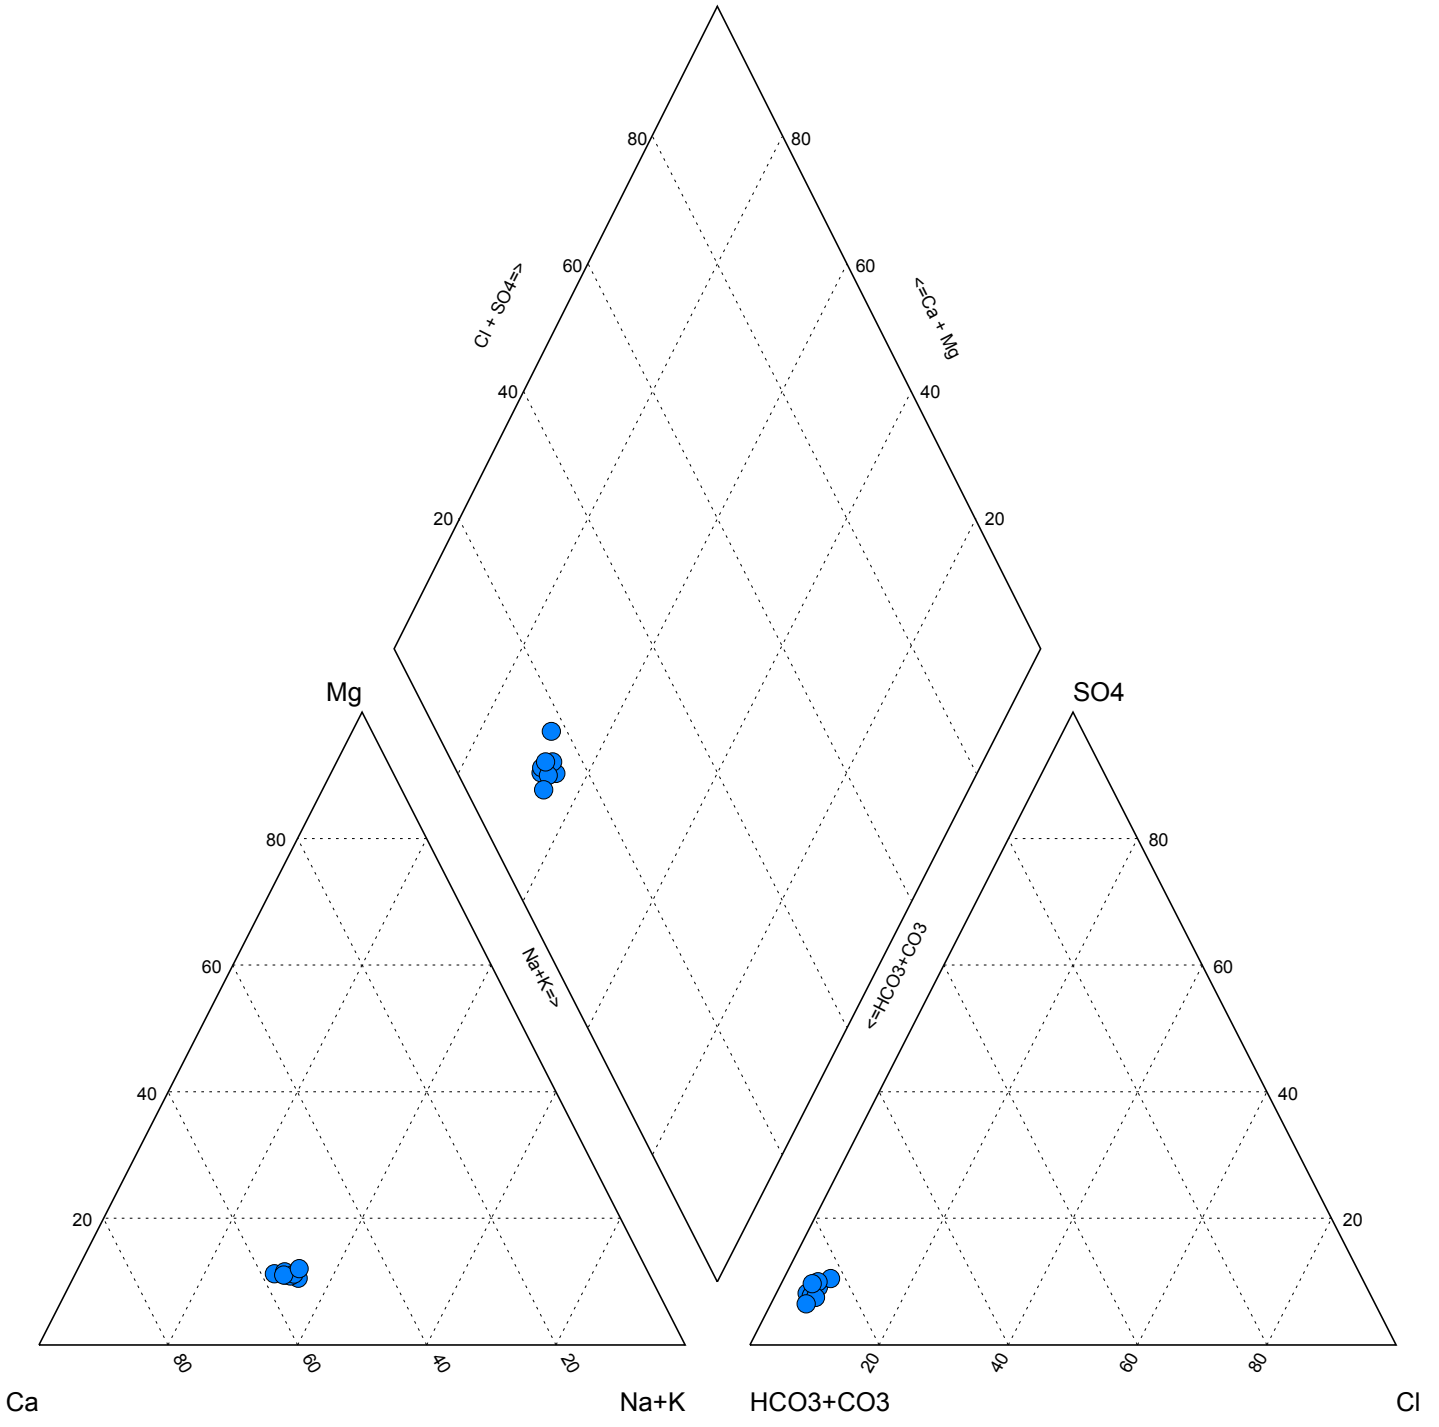
File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca



Notes:
1. The data set includes all results for individual samples for the years 2004-2008.
2. The axes of the Piper Plot indicate percentage of total milli-equivalents of ions.

Appendix 9.2E
Piper Plot of Well MW11S

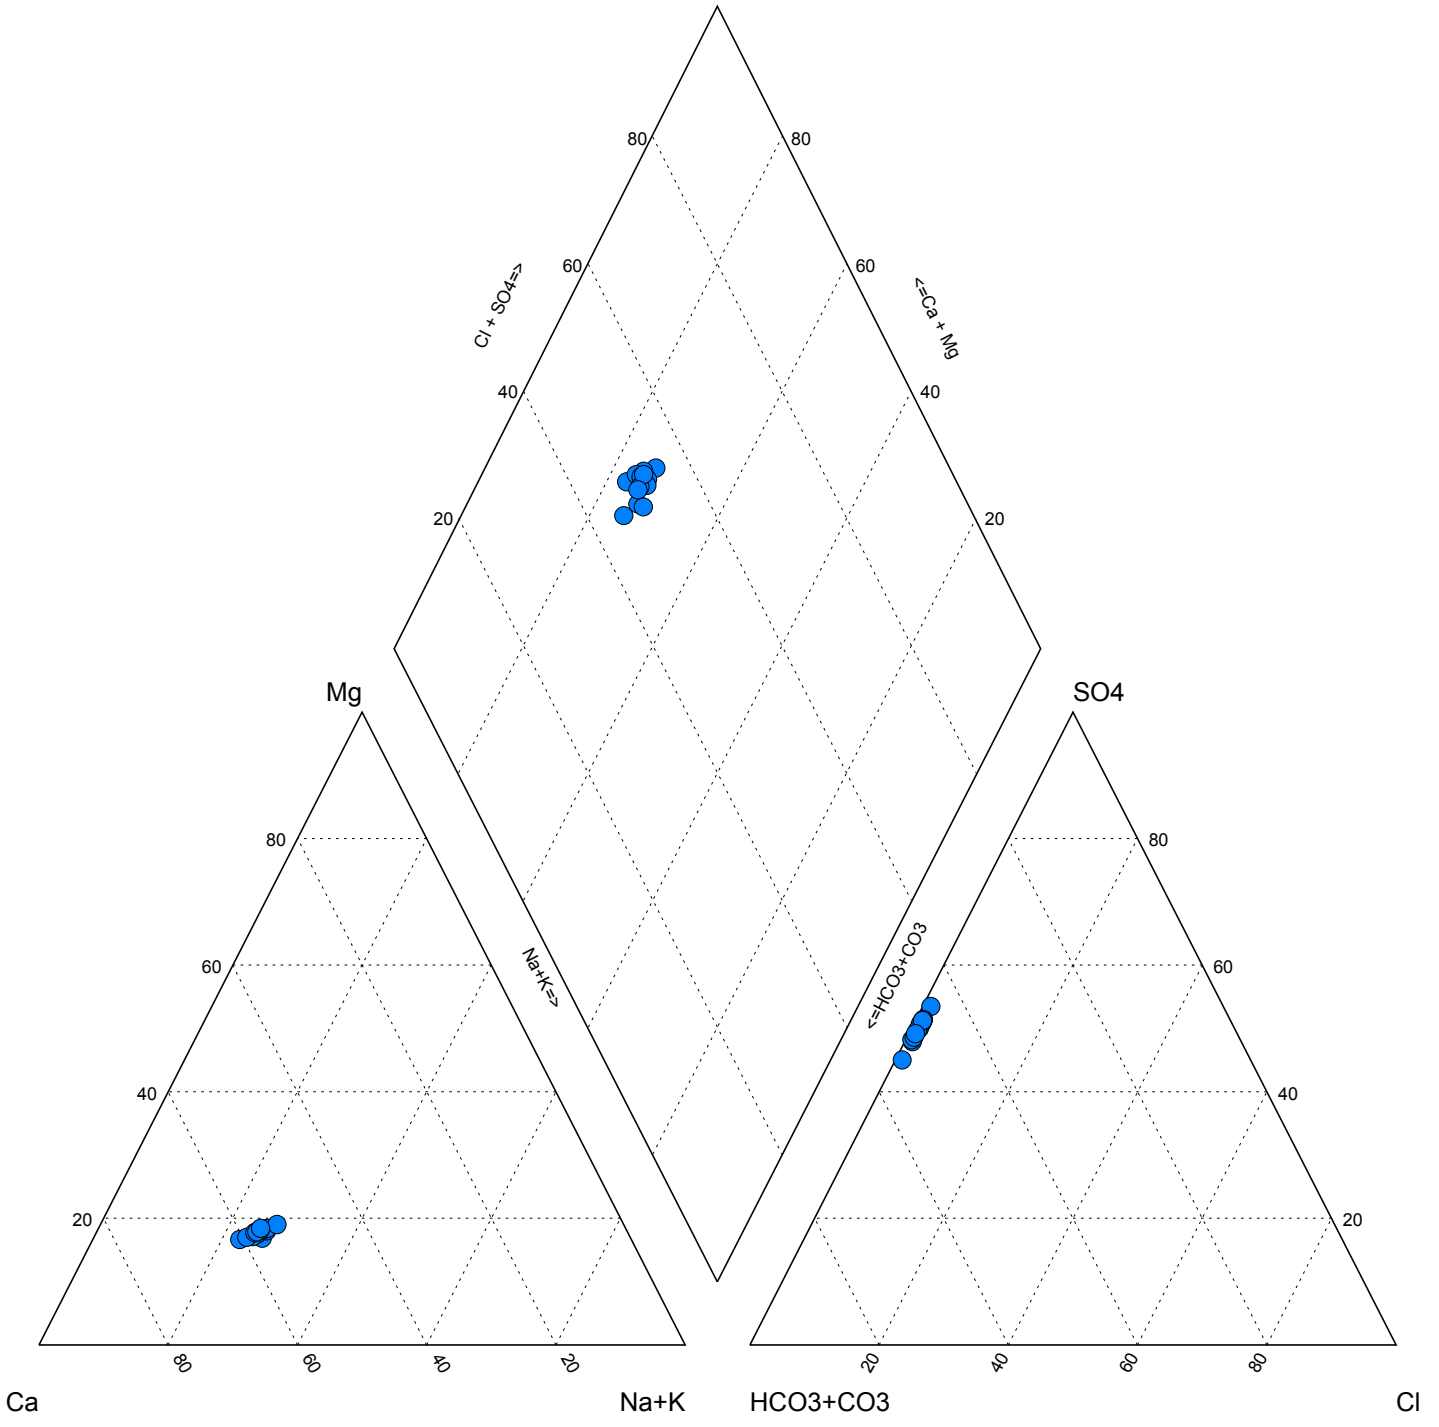
File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca



Notes:
1. The data set includes all results for individual samples for the years 2004-2008.
2. The axes of the Piper Plot indicate percentage of total milli-equivalents of ions.

Appendix 9.2E
Piper Plot of Well MW11SS

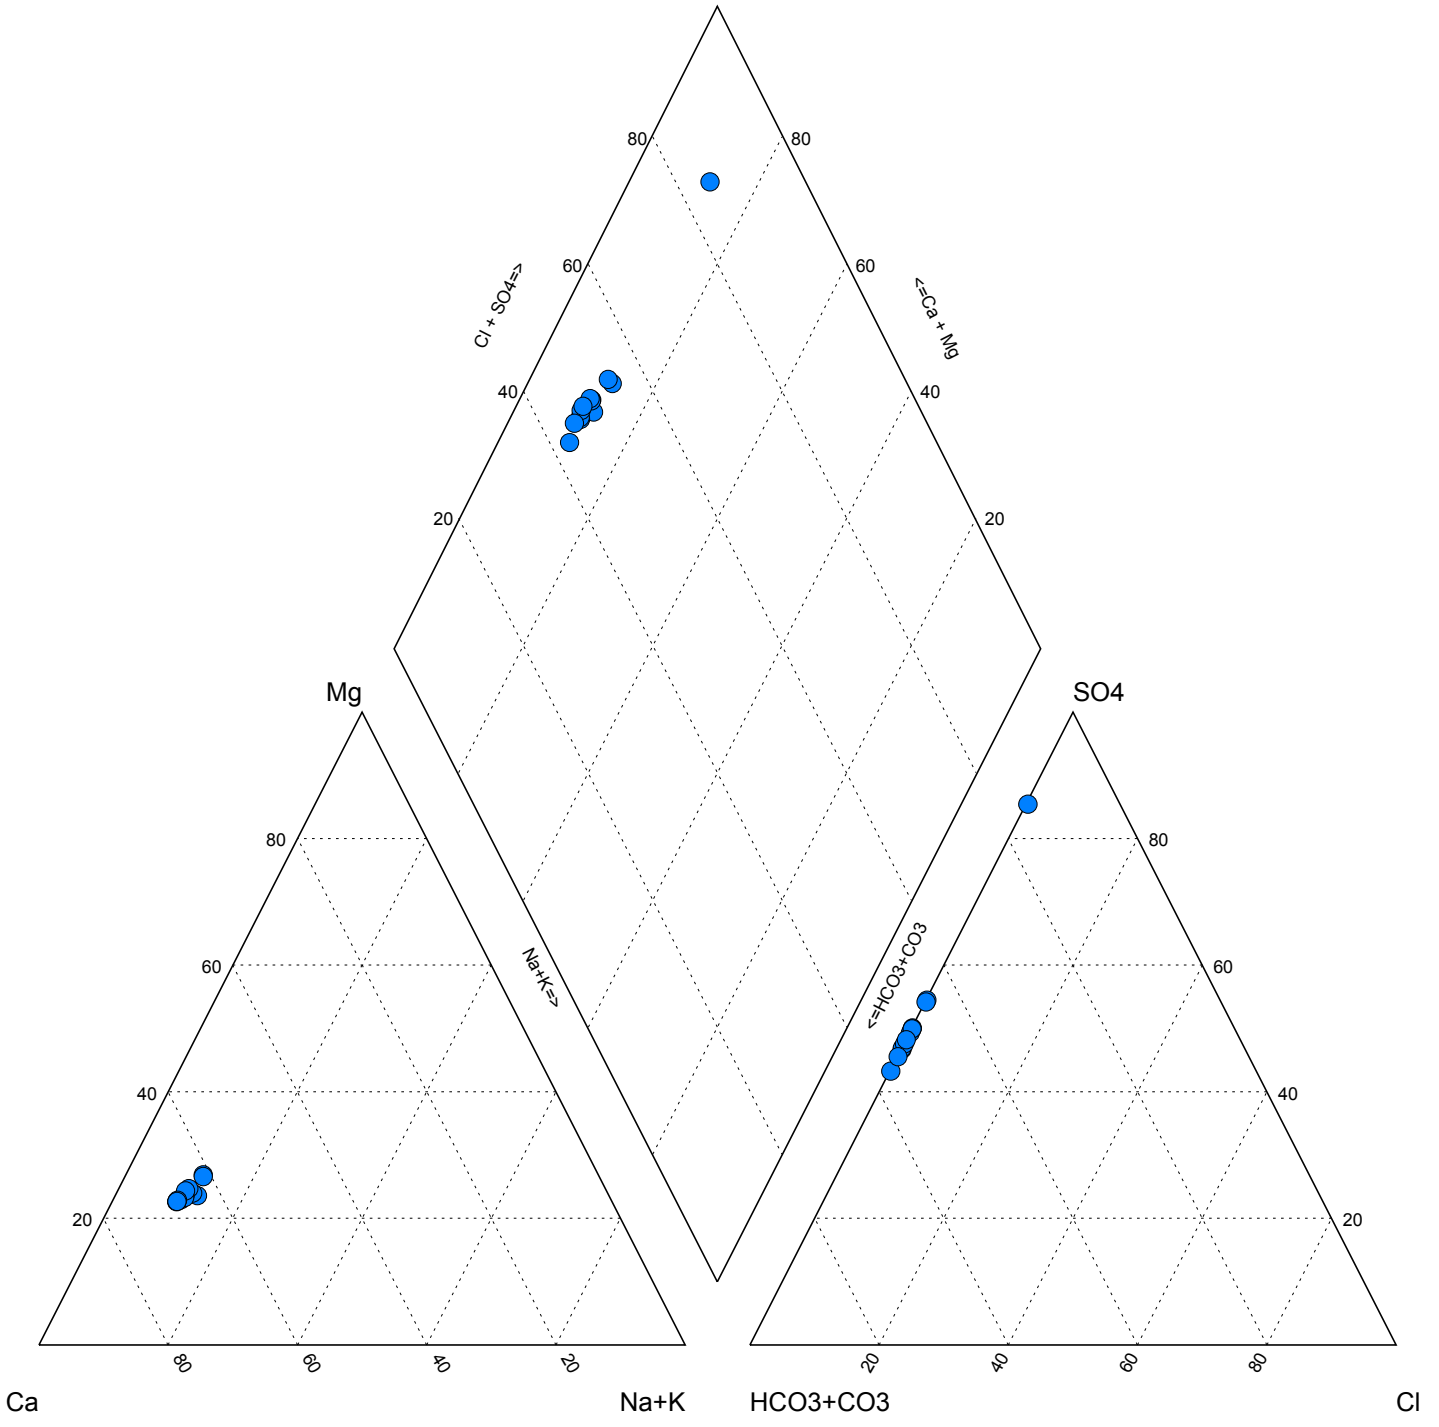
File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca



Notes:
1. The data set includes all results for individual samples for the years 2004-2008.
2. The axes of the Piper Plot indicate percentage of total milli-equivalents of ions.

Appendix 9.2E
Piper Plot of Well MW12D

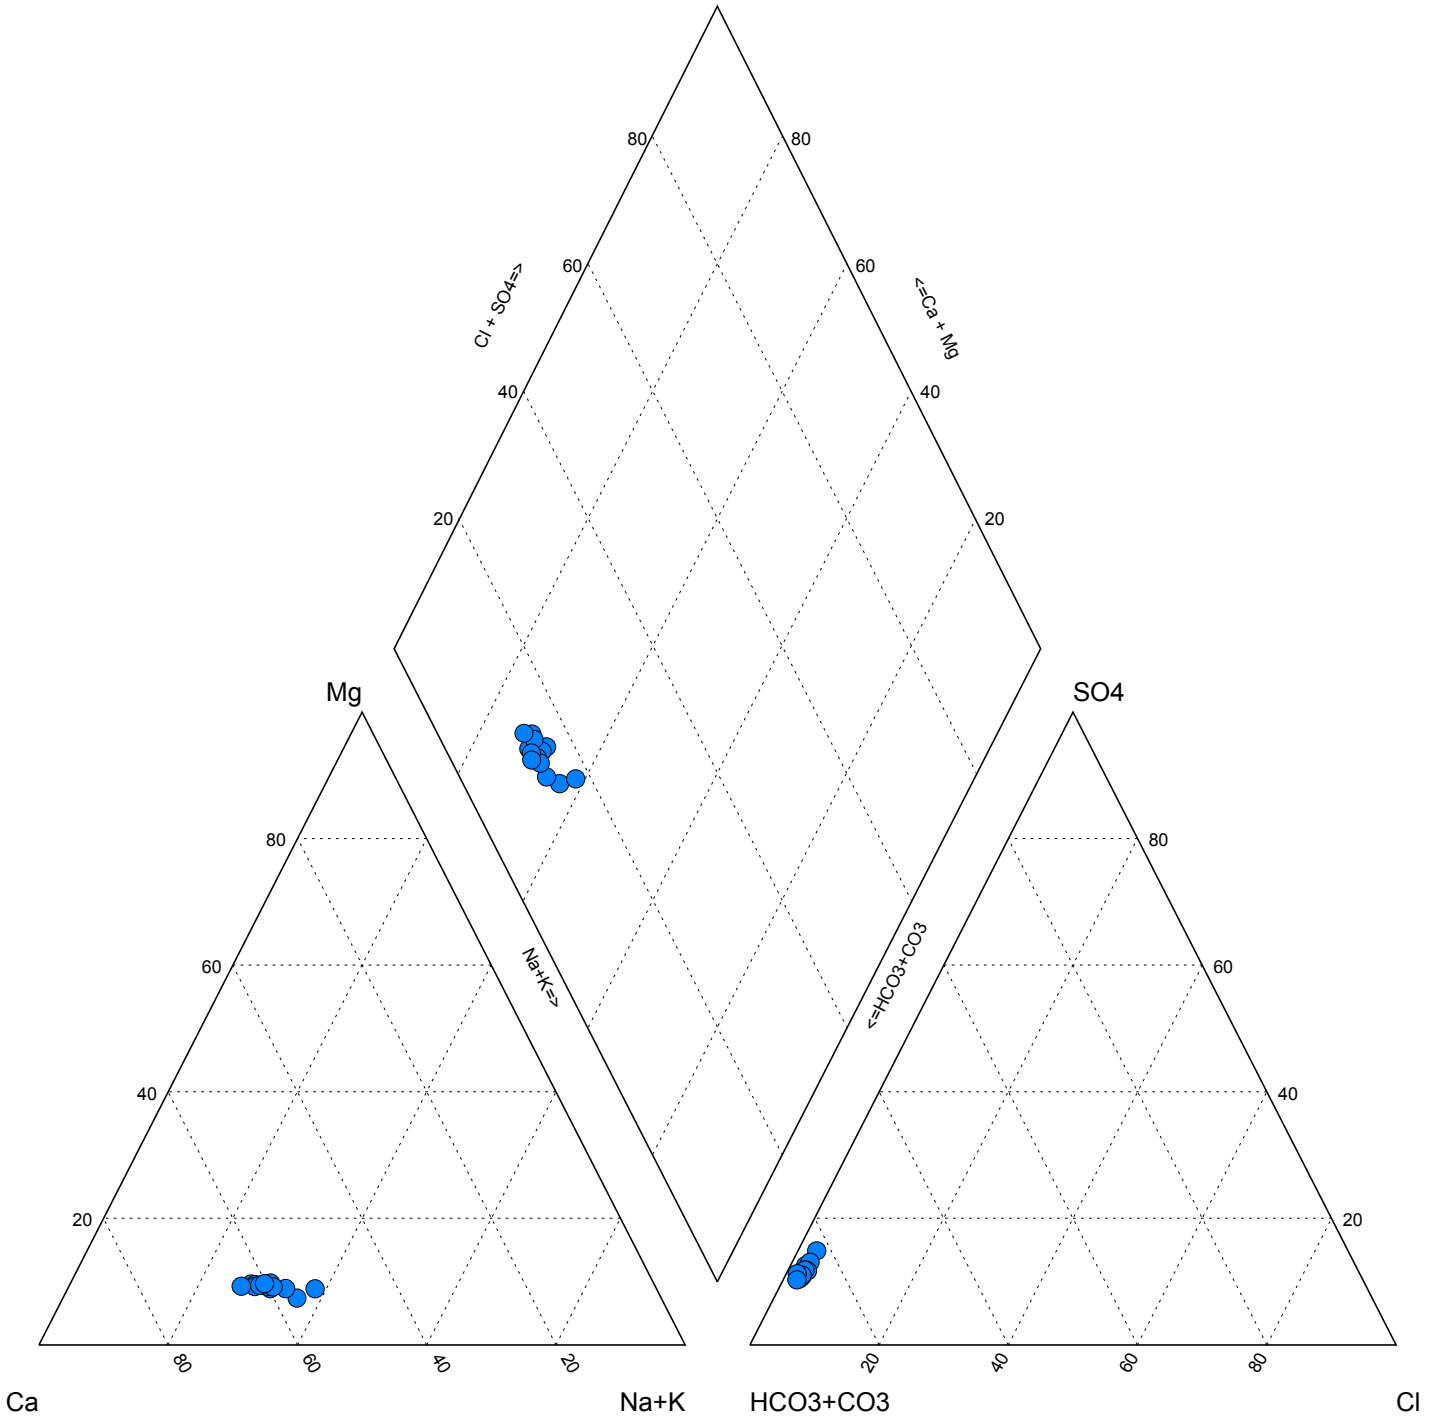
File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca



Notes:
1. The data set includes all results for individual samples for the years 2004-2008.
2. The axes of the Piper Plot indicate percentage of total milli-equivalents of ions.

Appendix 9.2E
Piper Plot of Well MW12S

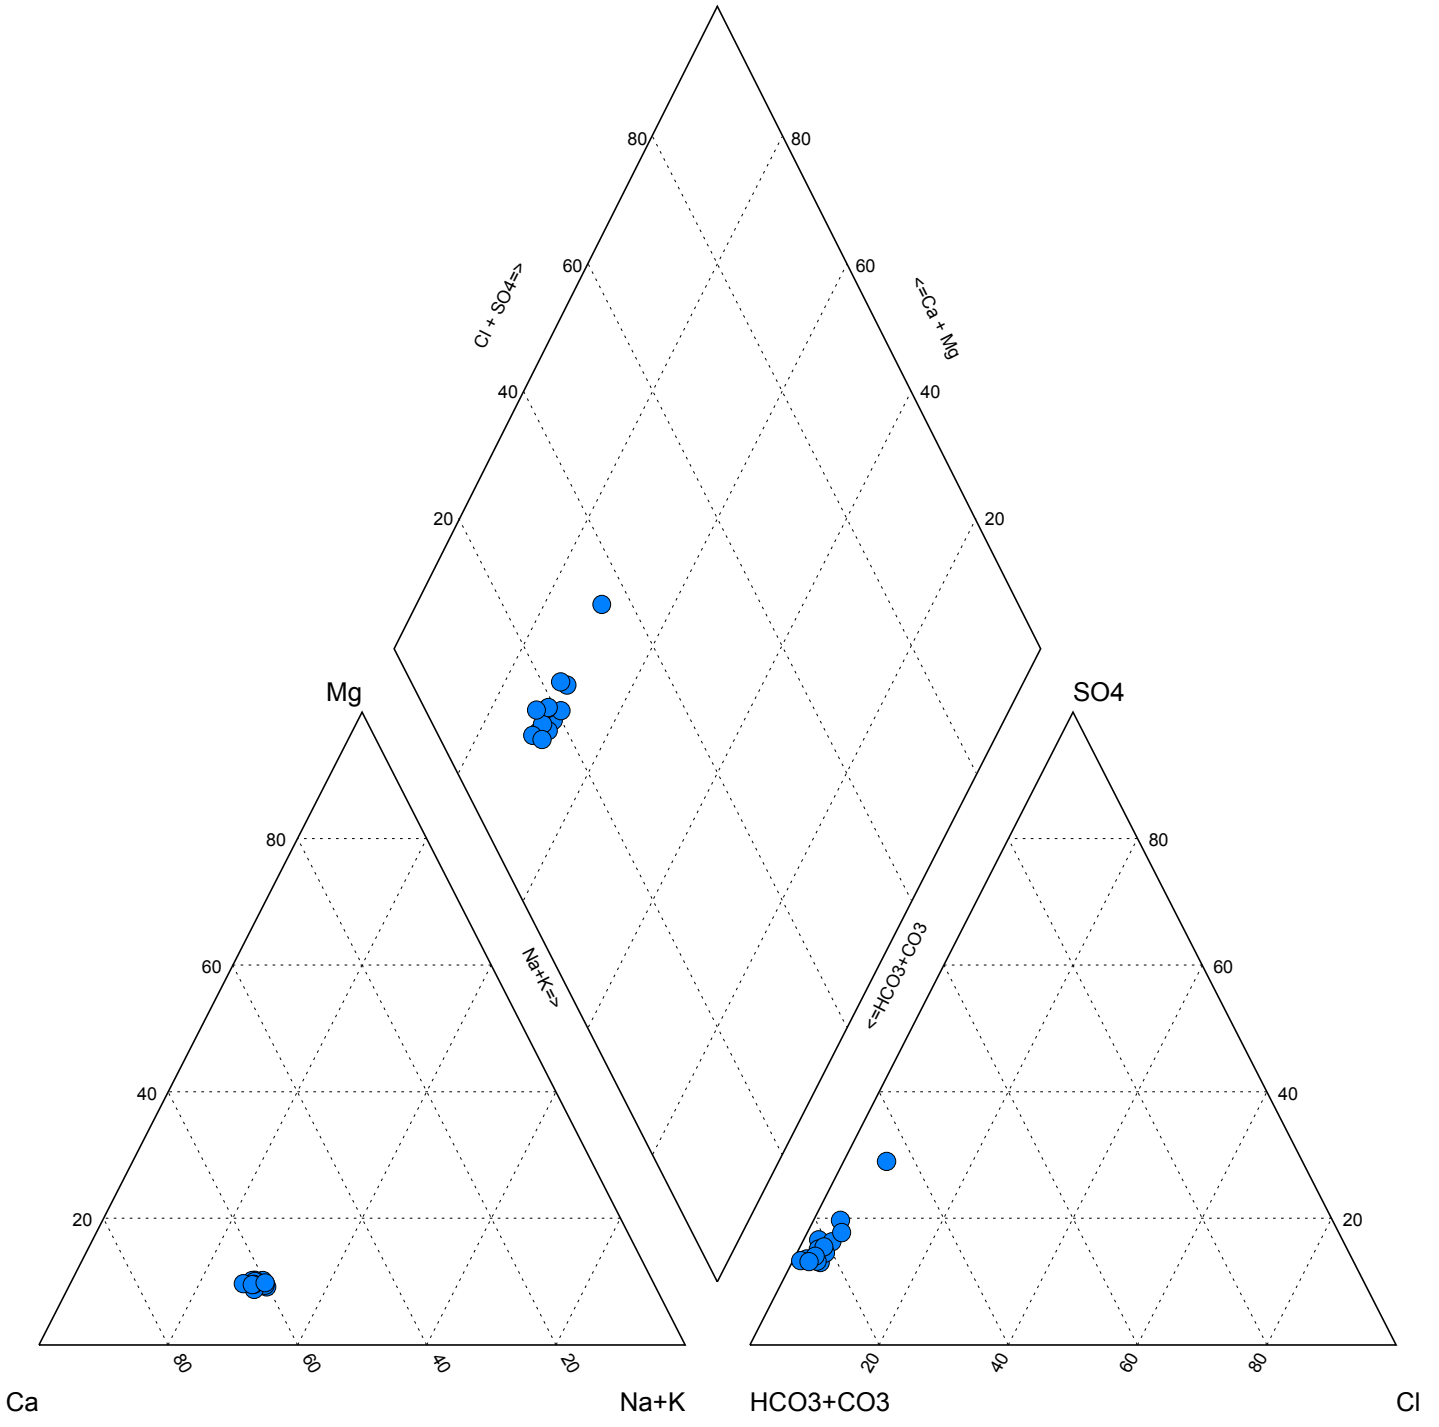
File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca



Notes:
1. The data set includes all results for individual samples for the years 2004-2008.
2. The axes of the Piper Plot indicate percentage of total milli-equivalents of ions.

Appendix 9.2E
Piper Plot of Well MW13D

File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca

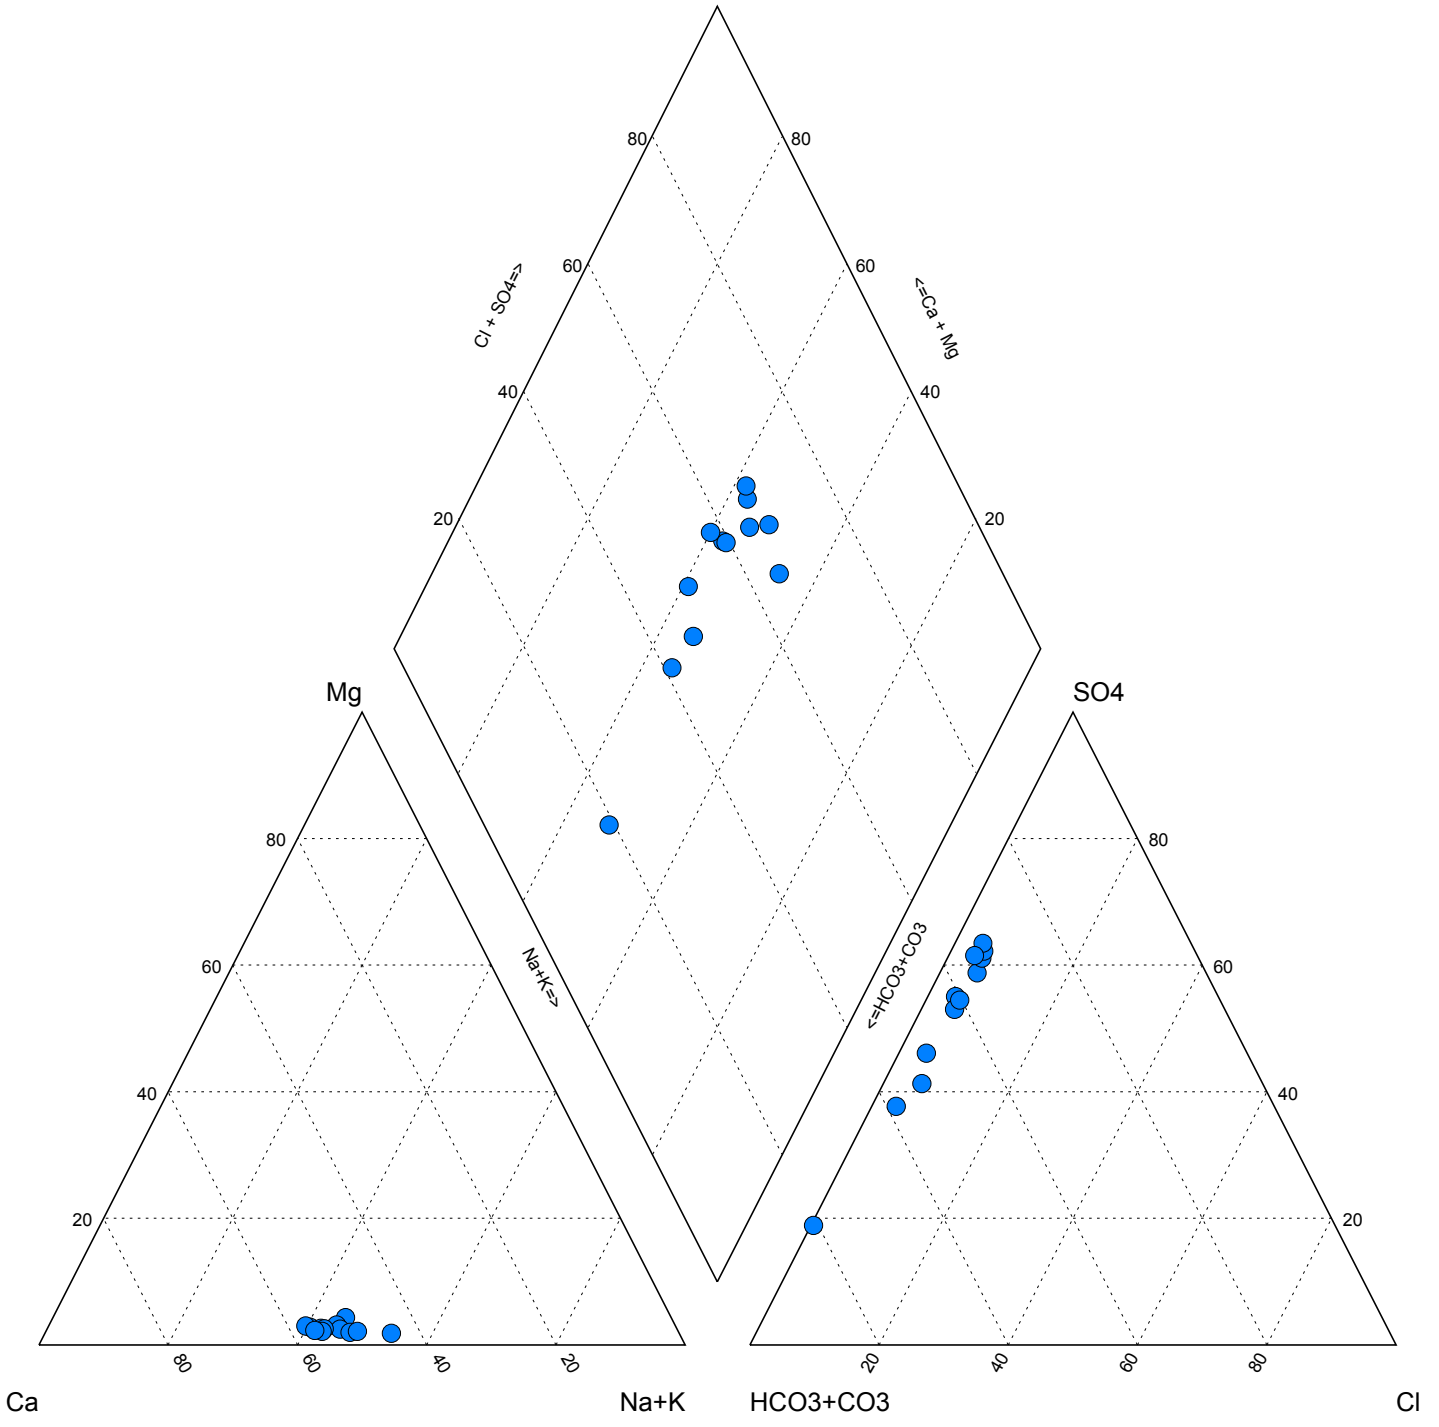


Notes:
1. The data set includes all results for individual samples for the years 2004-2008.
2. The axes of the Piper Plot indicate percentage of total milli-equivalents of ions.

THE pebble PARTNERSHIP

Appendix 9.2E
Piper Plot of Well MW13S

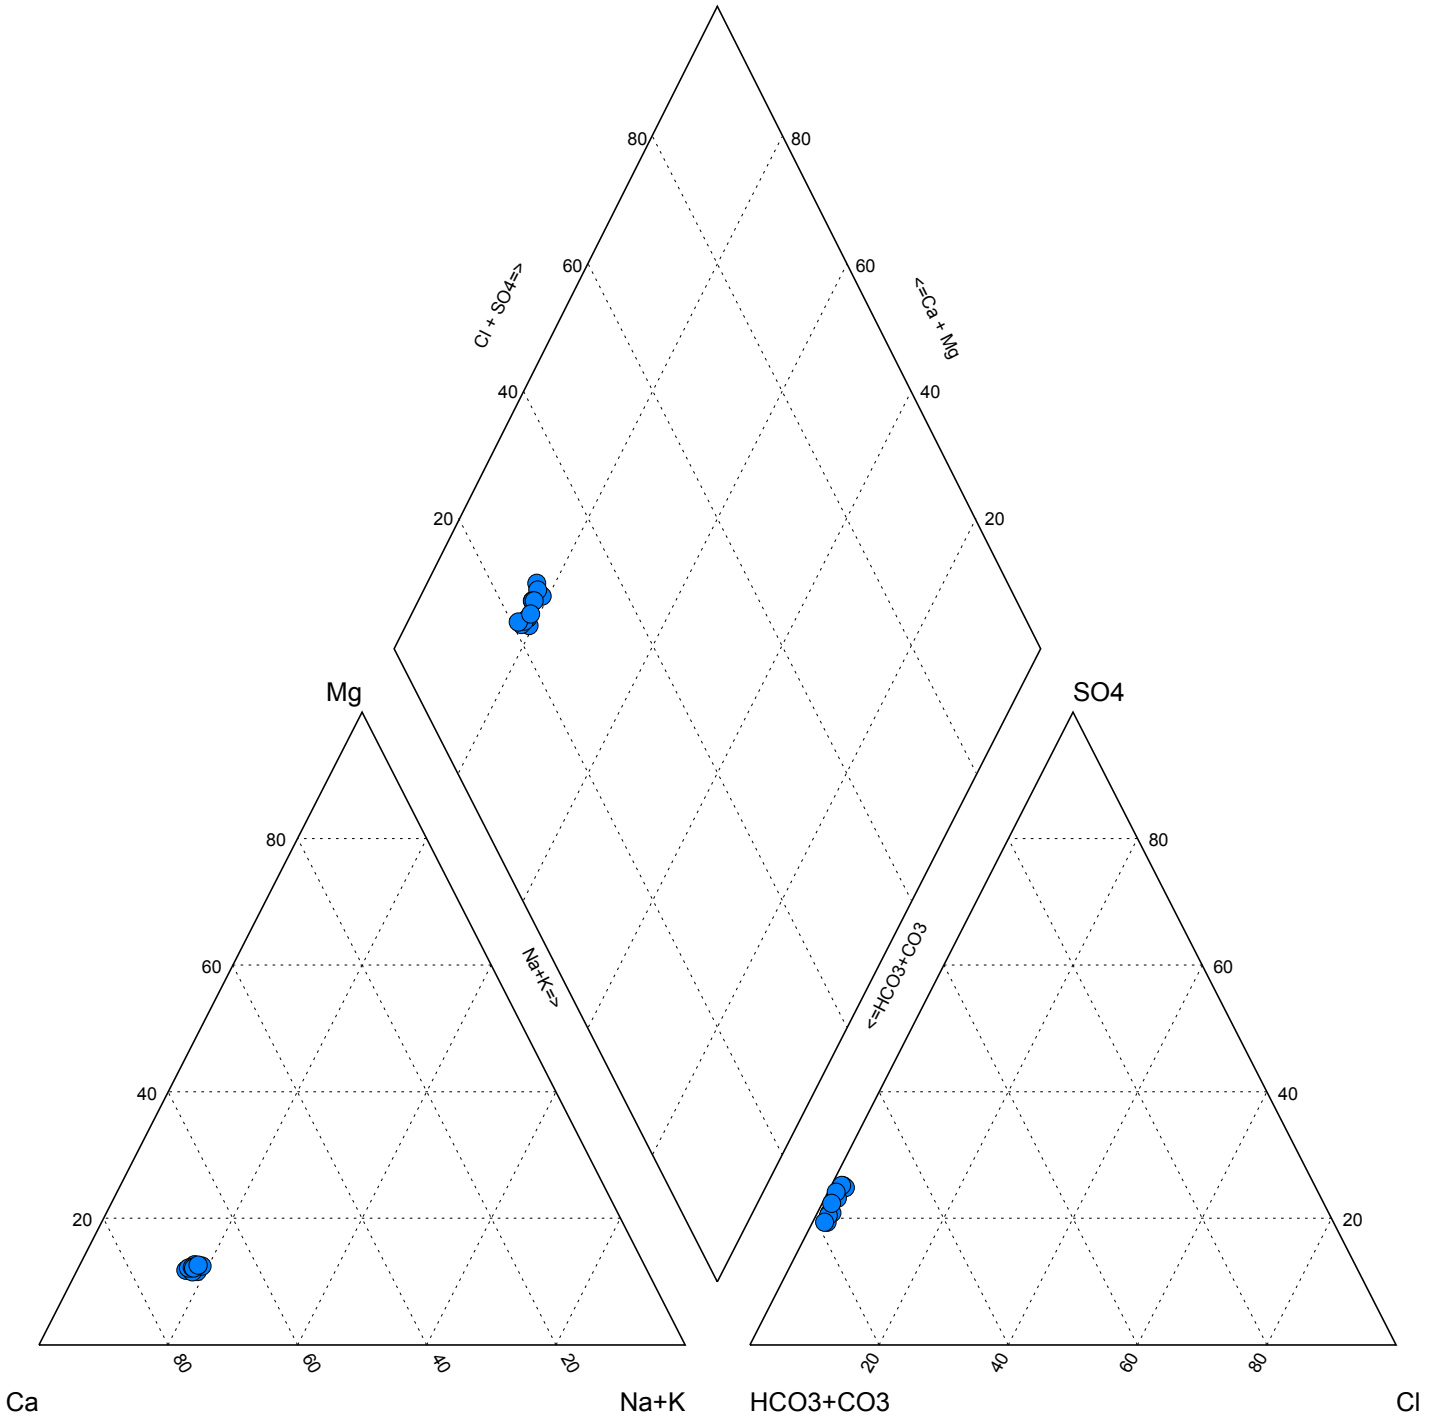
File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca



Notes:
1. The data set includes all results for individual samples for the years 2004-2008.
2. The axes of the Piper Plot indicate percentage of total milli-equivalents of ions.

Appendix 9.2E
Piper Plot of Well MW14D

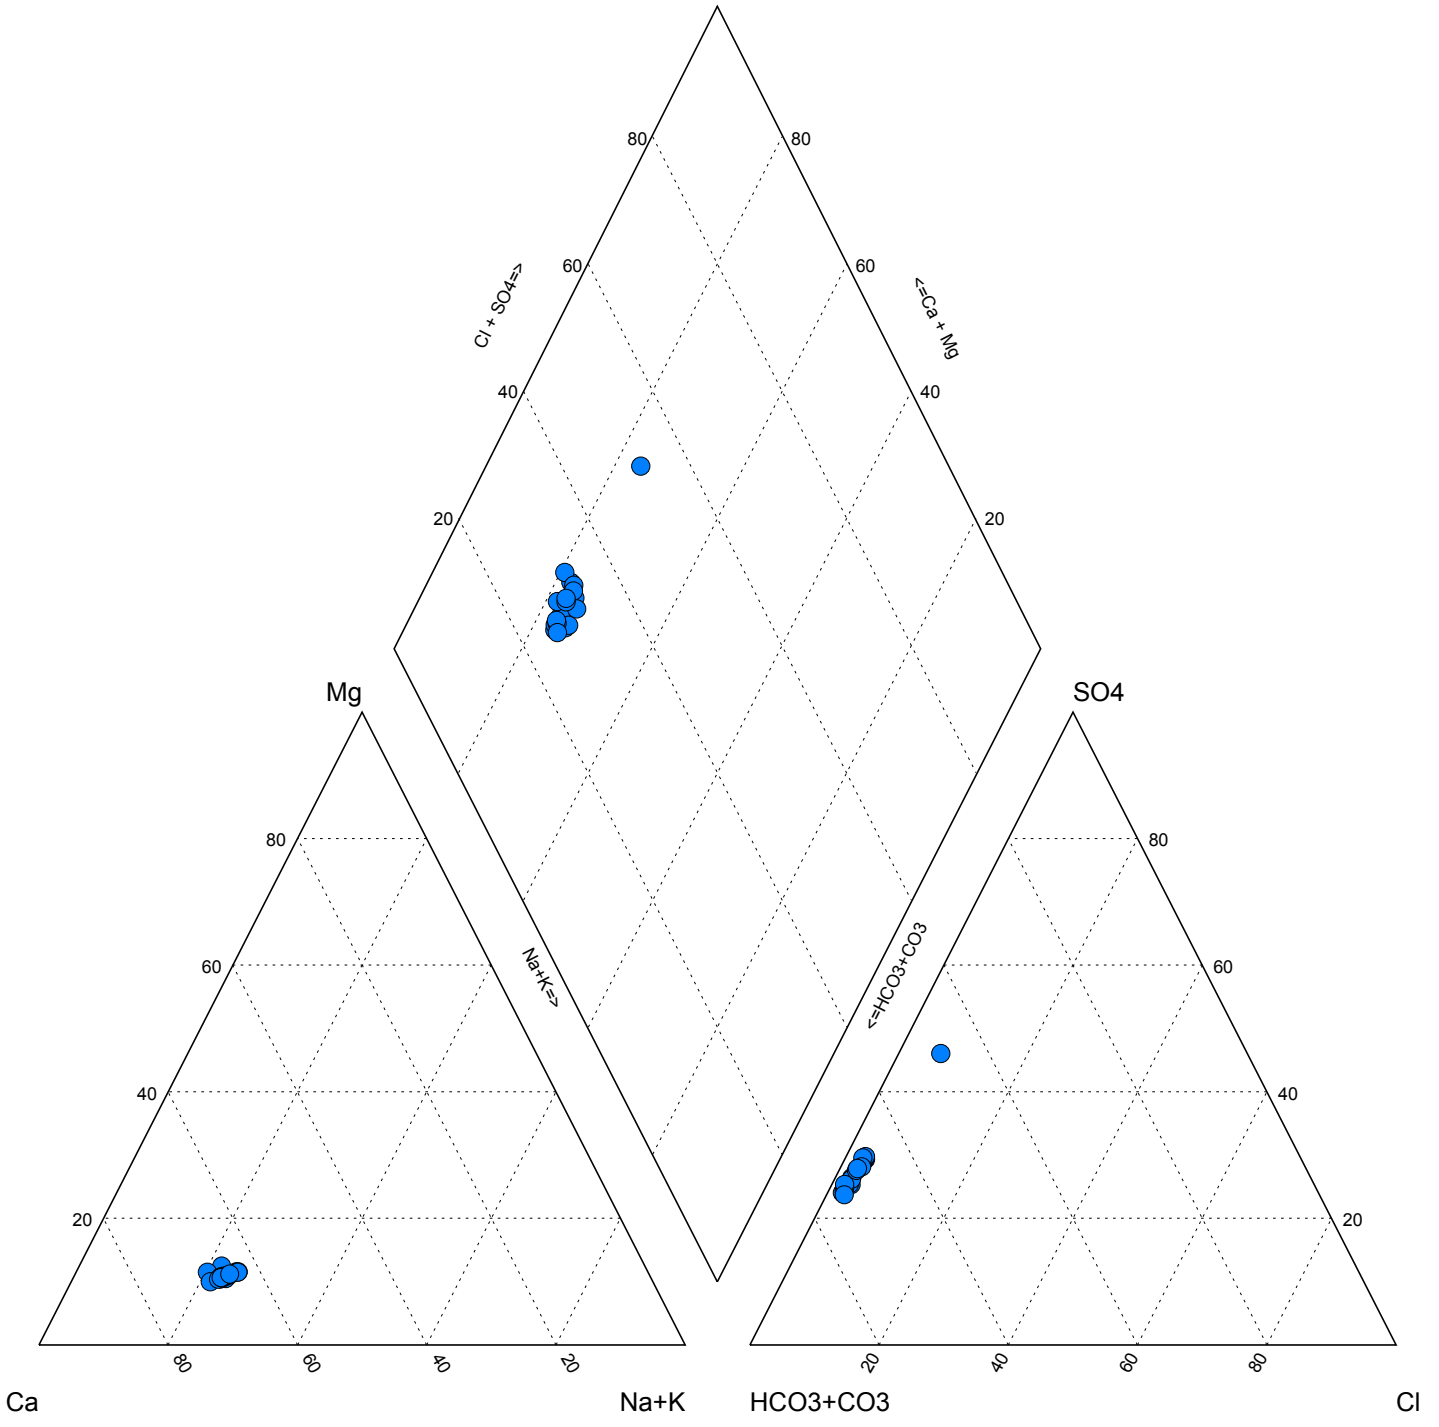
File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca



Notes:
1. The data set includes all results for individual samples for the years 2004-2008.
2. The axes of the Piper Plot indicate percentage of total milli-equivalents of ions.

Appendix 9.2E
Piper Plot of Well MW14S

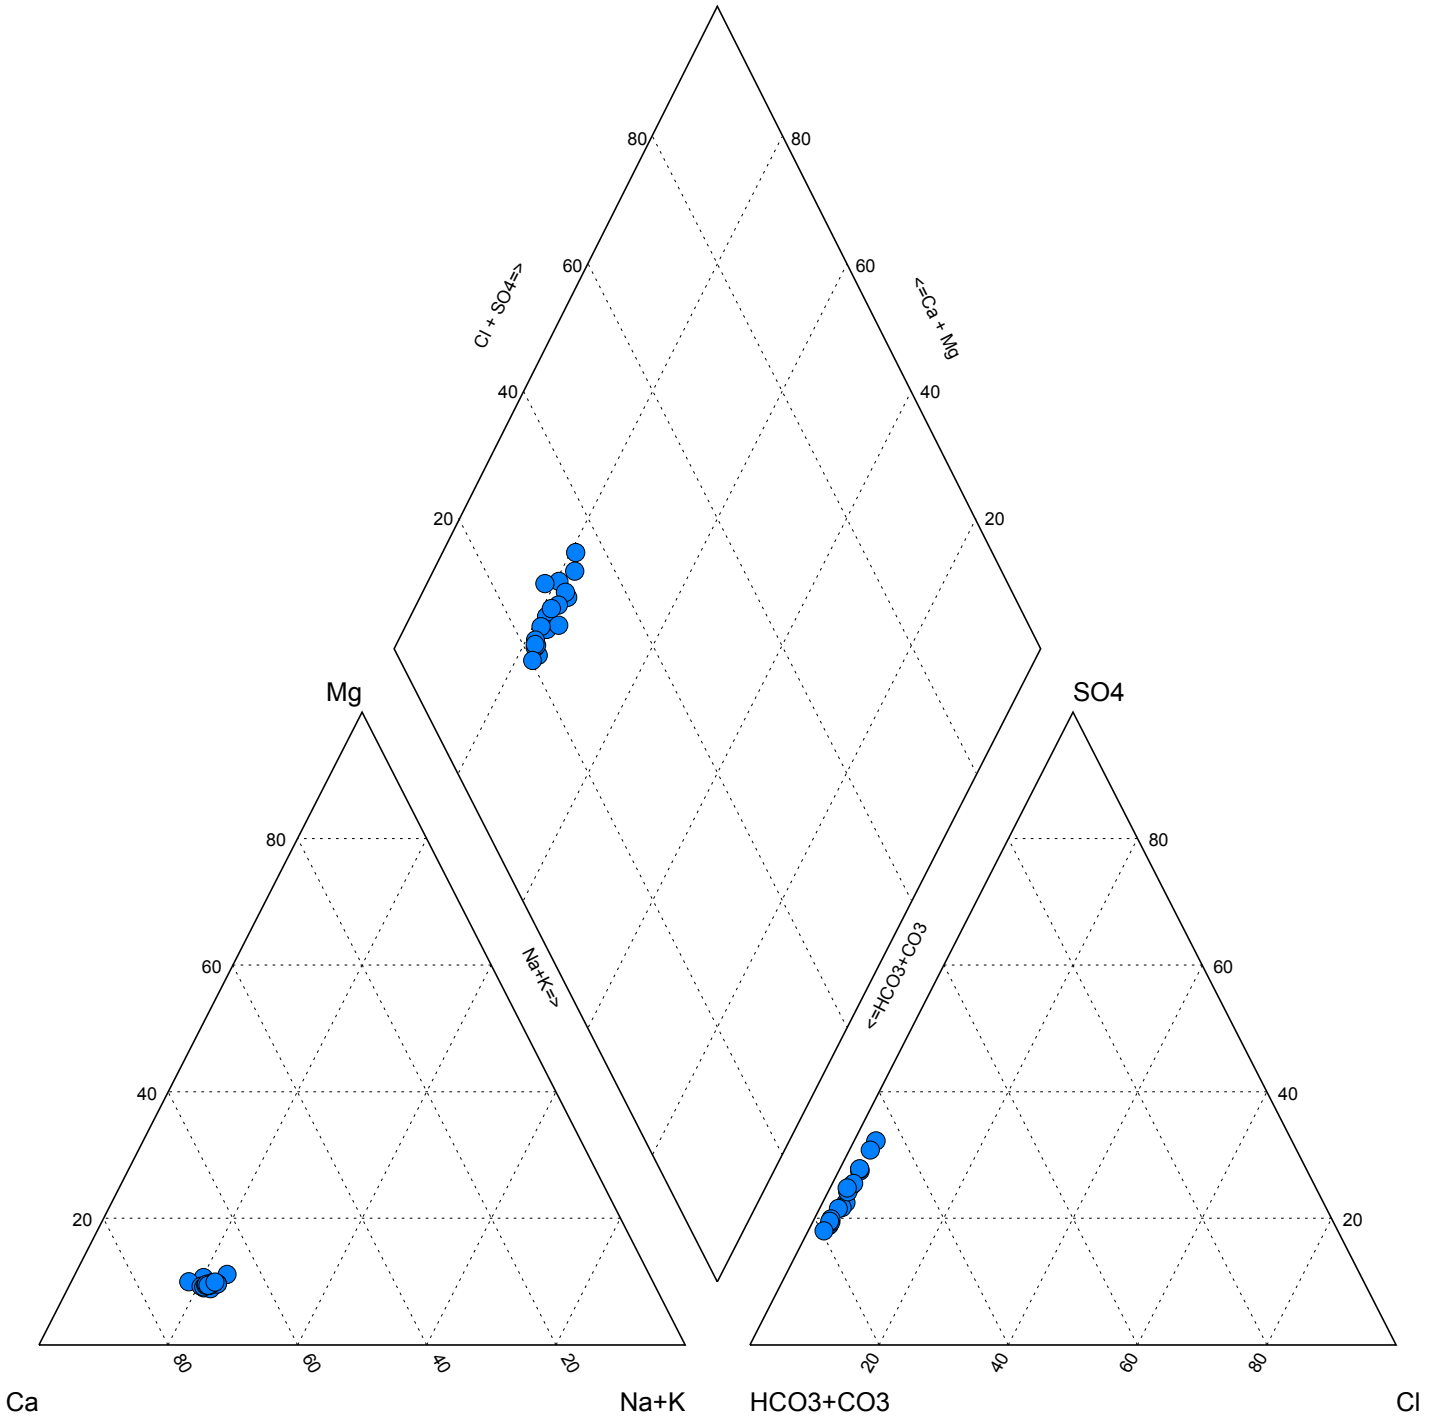
File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca



Notes:
1. The data set includes all results for individual samples for the years 2004-2008.
2. The axes of the Piper Plot indicate percentage of total milli-equivalents of ions.

Appendix 9.2E
Piper Plot of Well MW1D

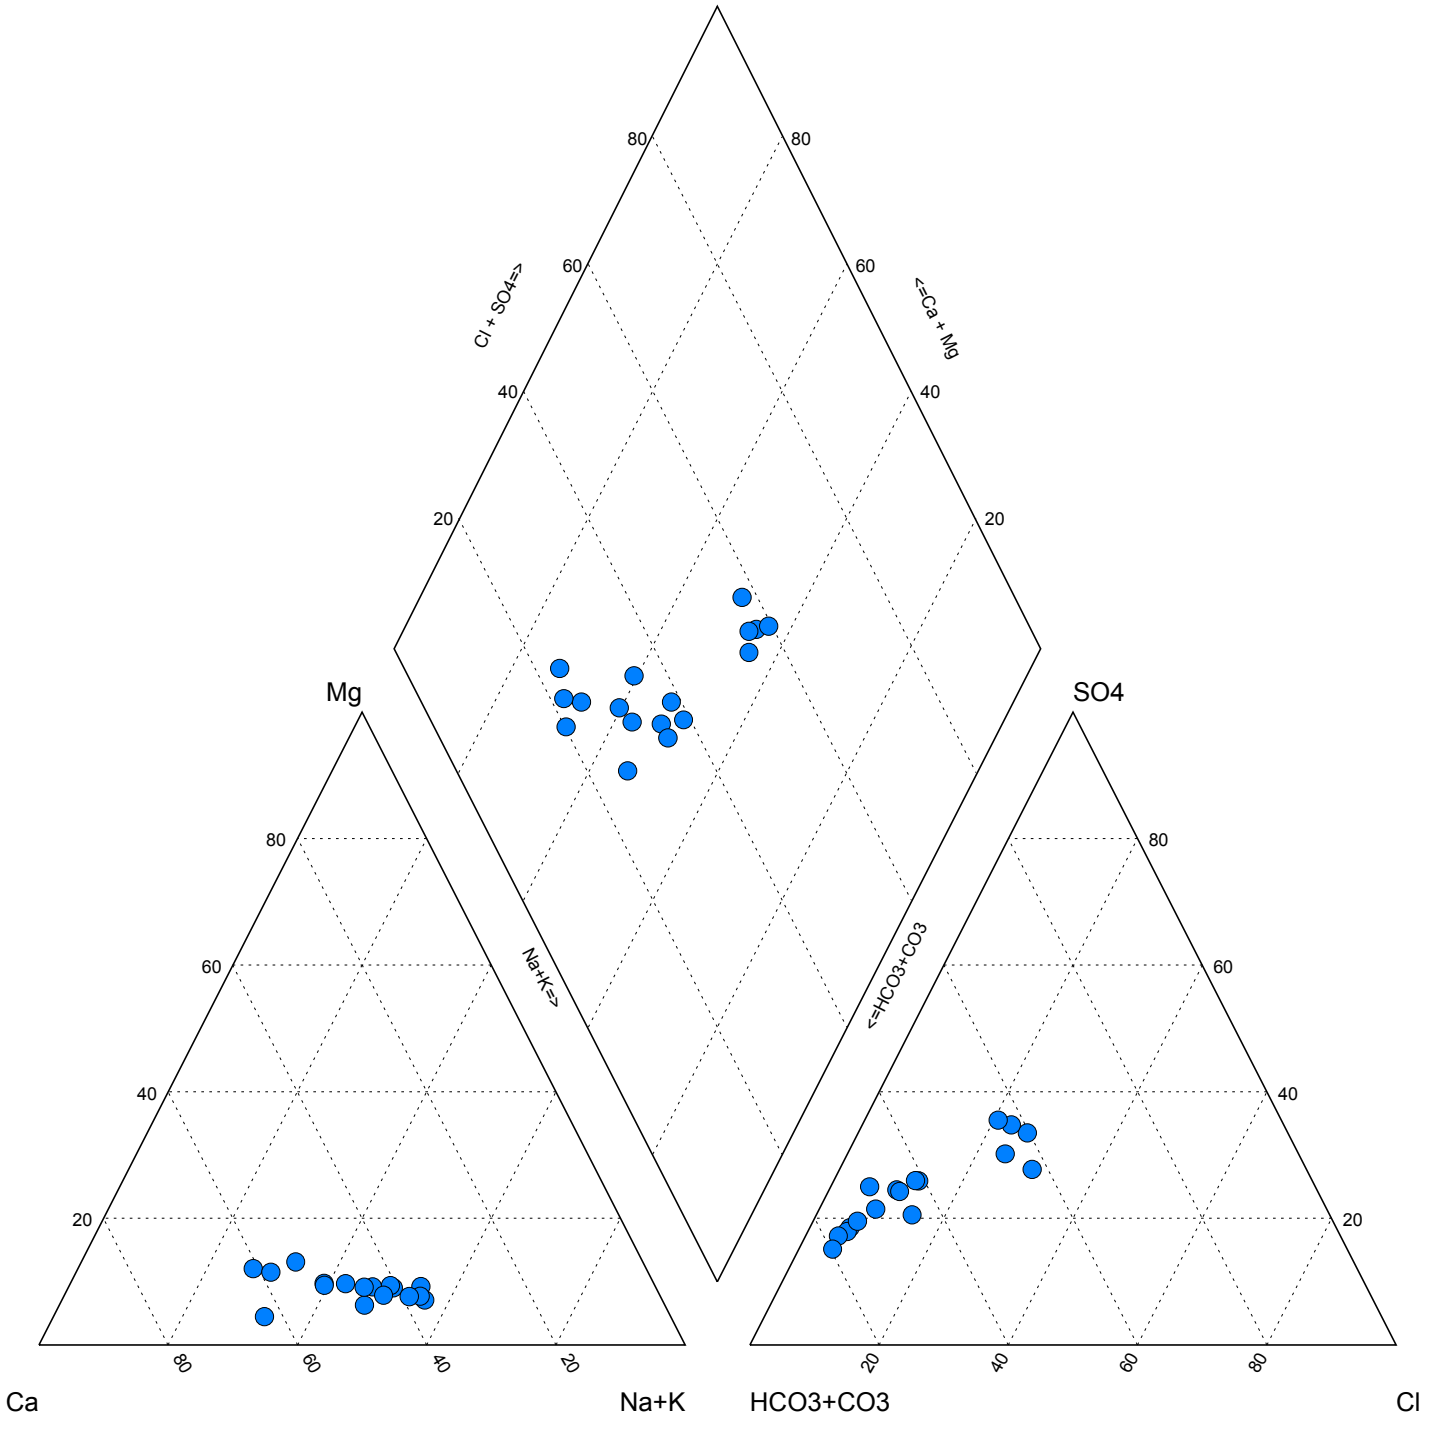
File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca



Notes:
1. The data set includes all results for individual samples for the years 2004-2008.
2. The axes of the Piper Plot indicate percentage of total milli-equivalents of ions.

Appendix 9.2E
Piper Plot of Well MW1M

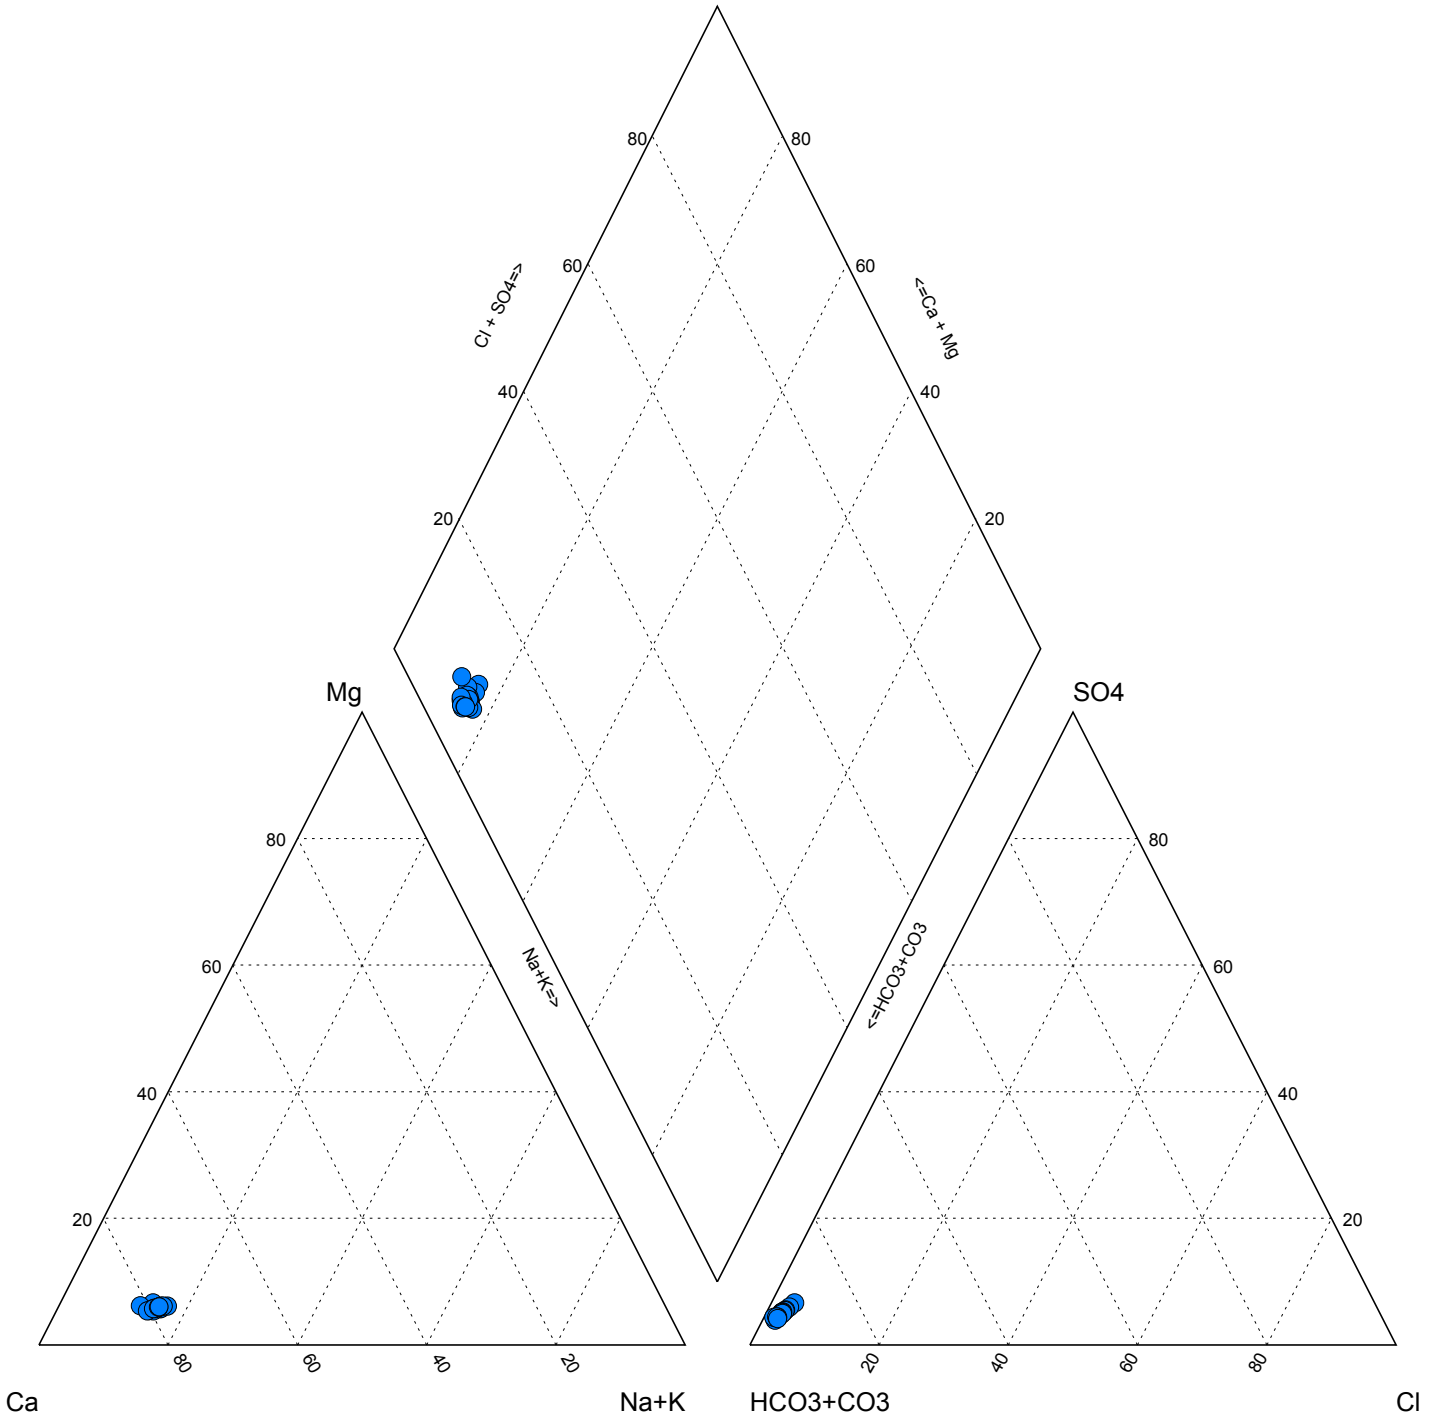
File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca



Notes:
1. The data set includes all results for individual samples for the years 2004-2008.
2. The axes of the Piper Plot indicate percentage of total milli-equivalents of ions.

Appendix 9.2E
Piper Plot of Well MW1S

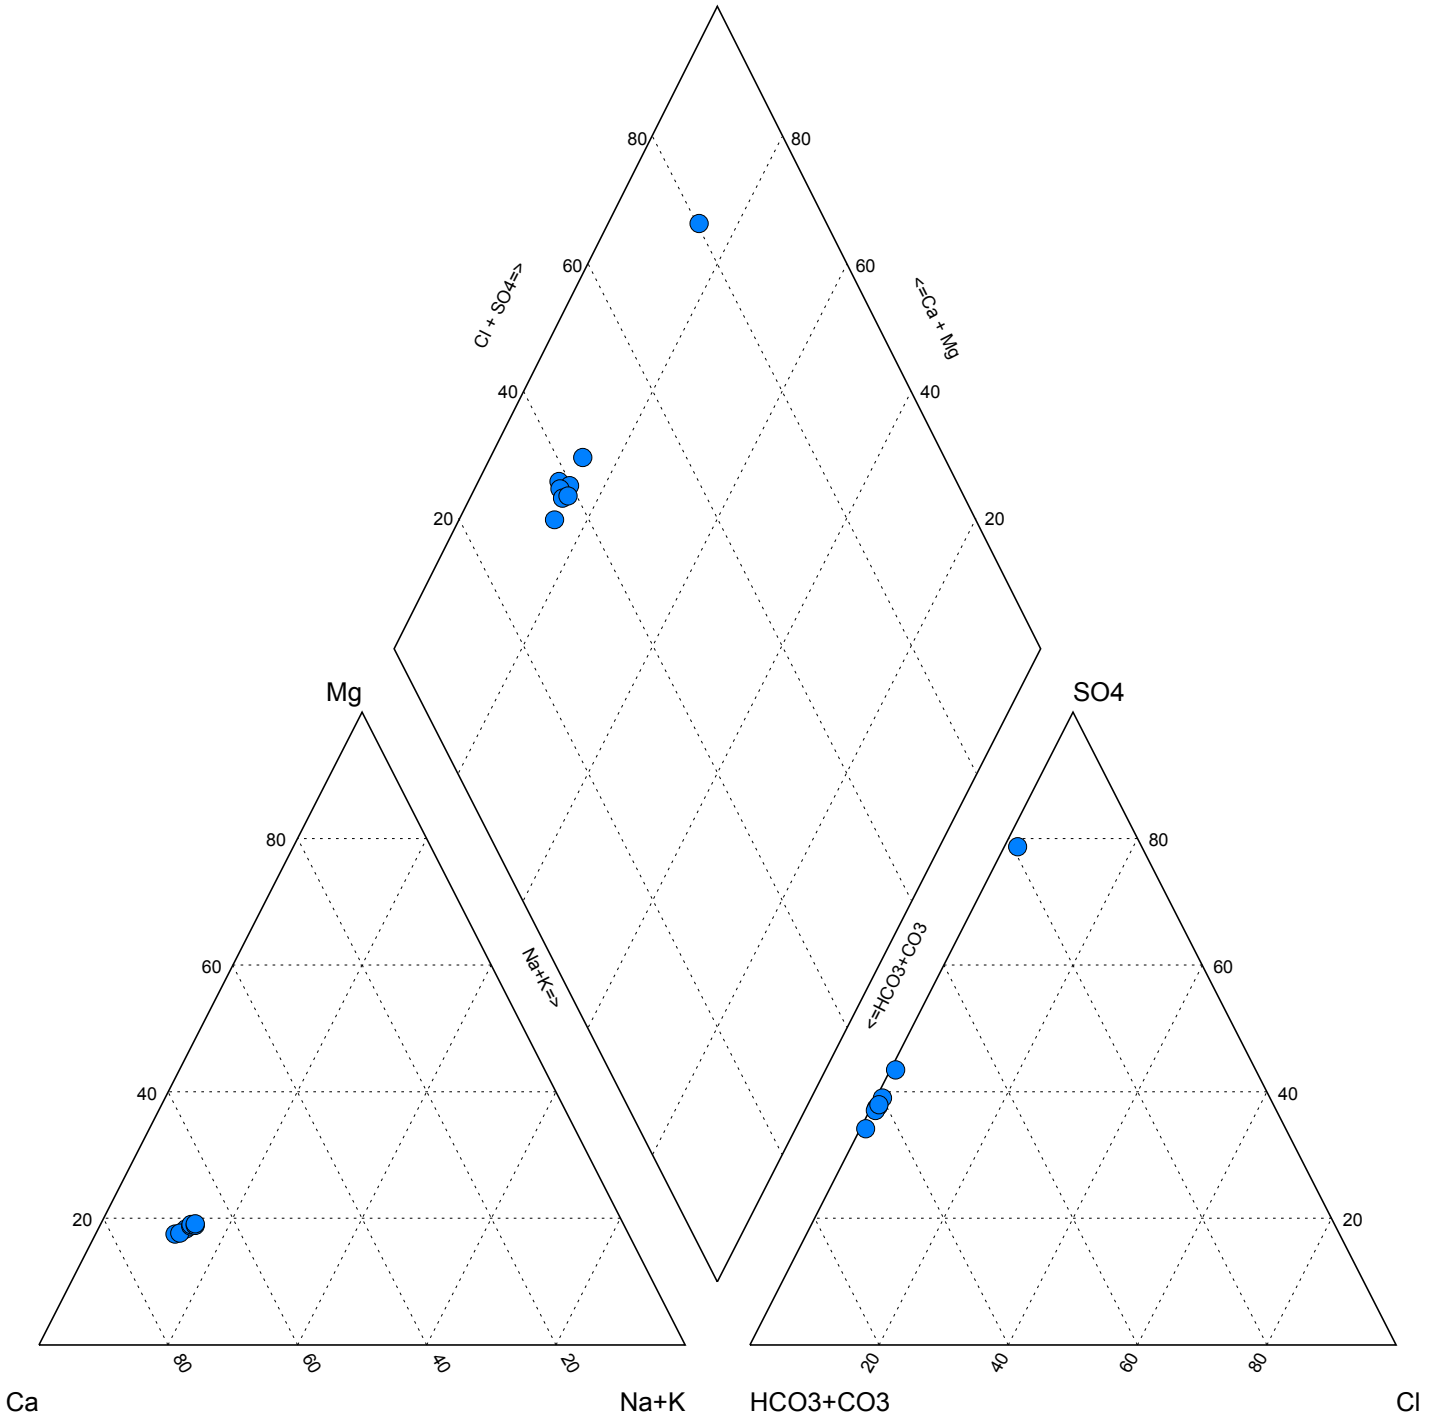
File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca



Notes:
1. The data set includes all results for individual samples for the years 2004-2008.
2. The axes of the Piper Plot indicate percentage of total milli-equivalents of ions.

Appendix 9.2E
Piper Plot of Well MW2D

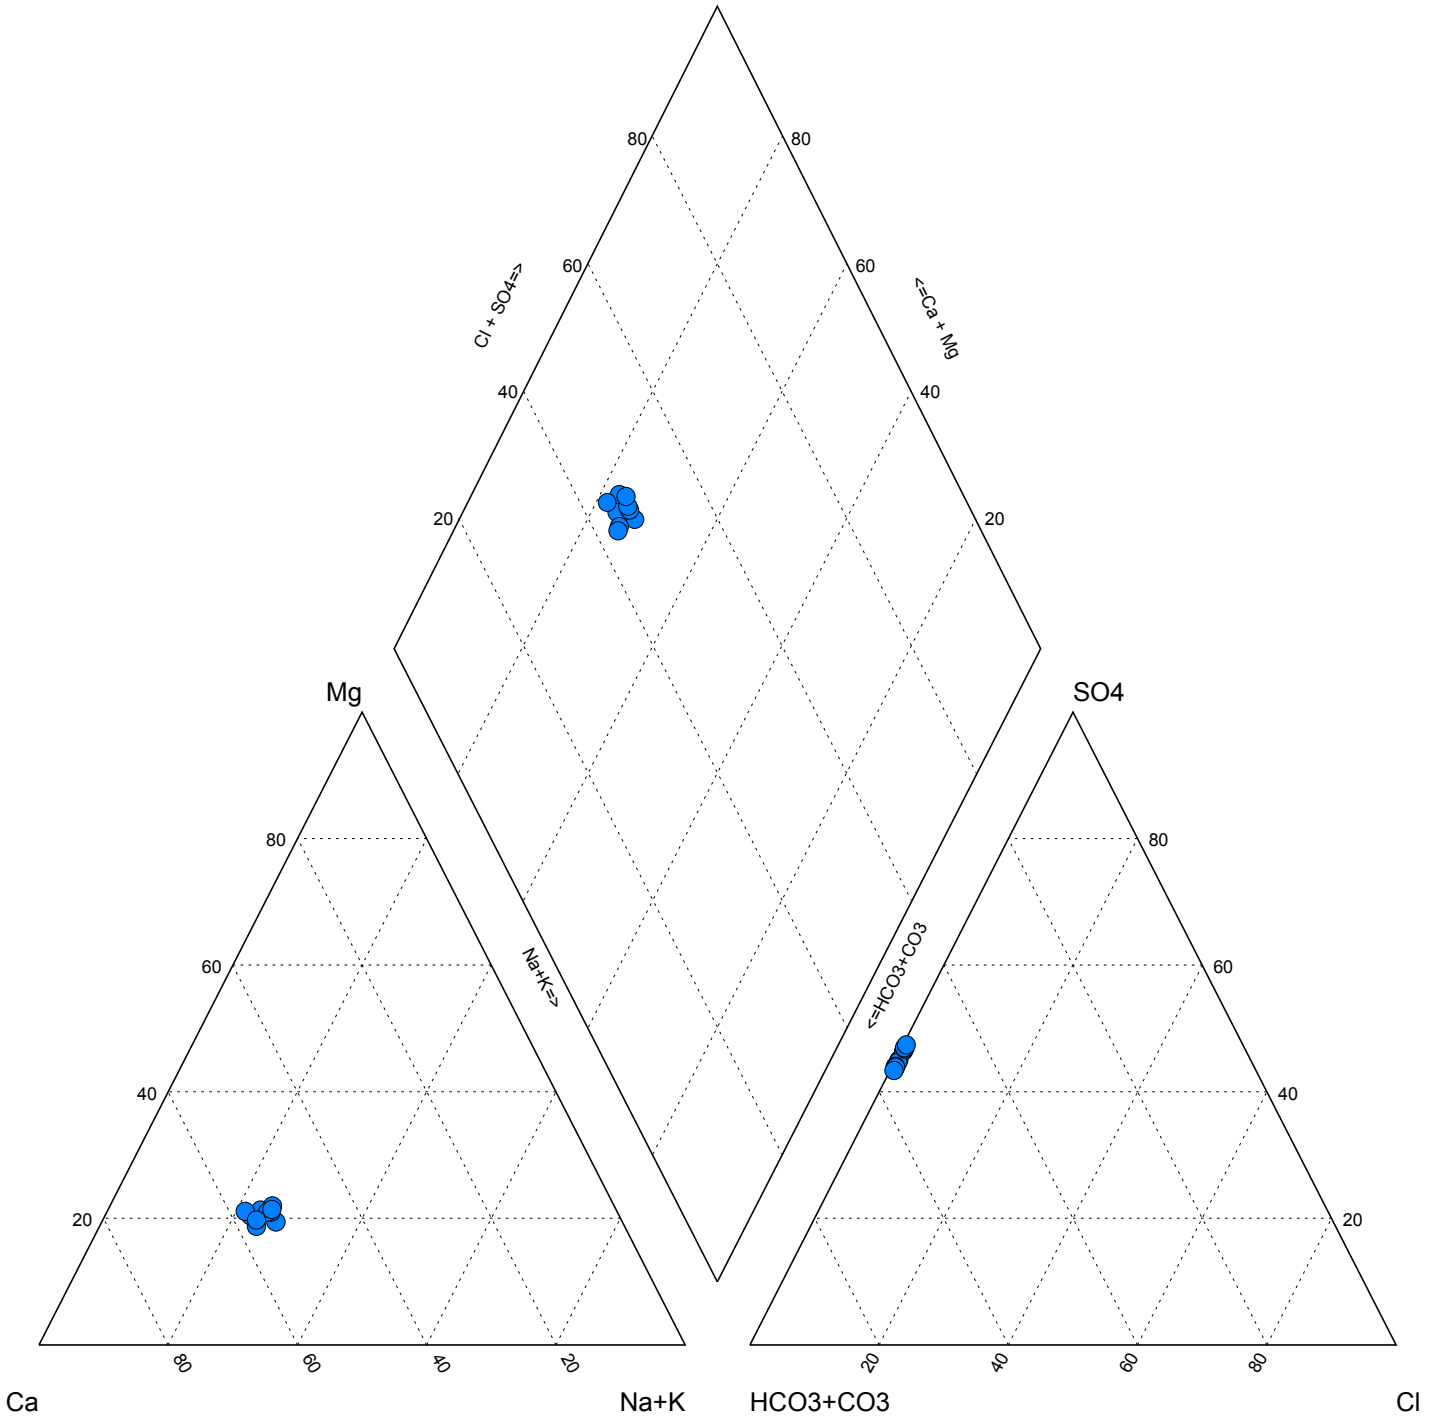
File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca



Notes:
1. The data set includes all results for individual samples for the years 2004-2008.
2. The axes of the Piper Plot indicate percentage of total milli-equivalents of ions.

Appendix 9.2E
Piper Plot of Well MW3D

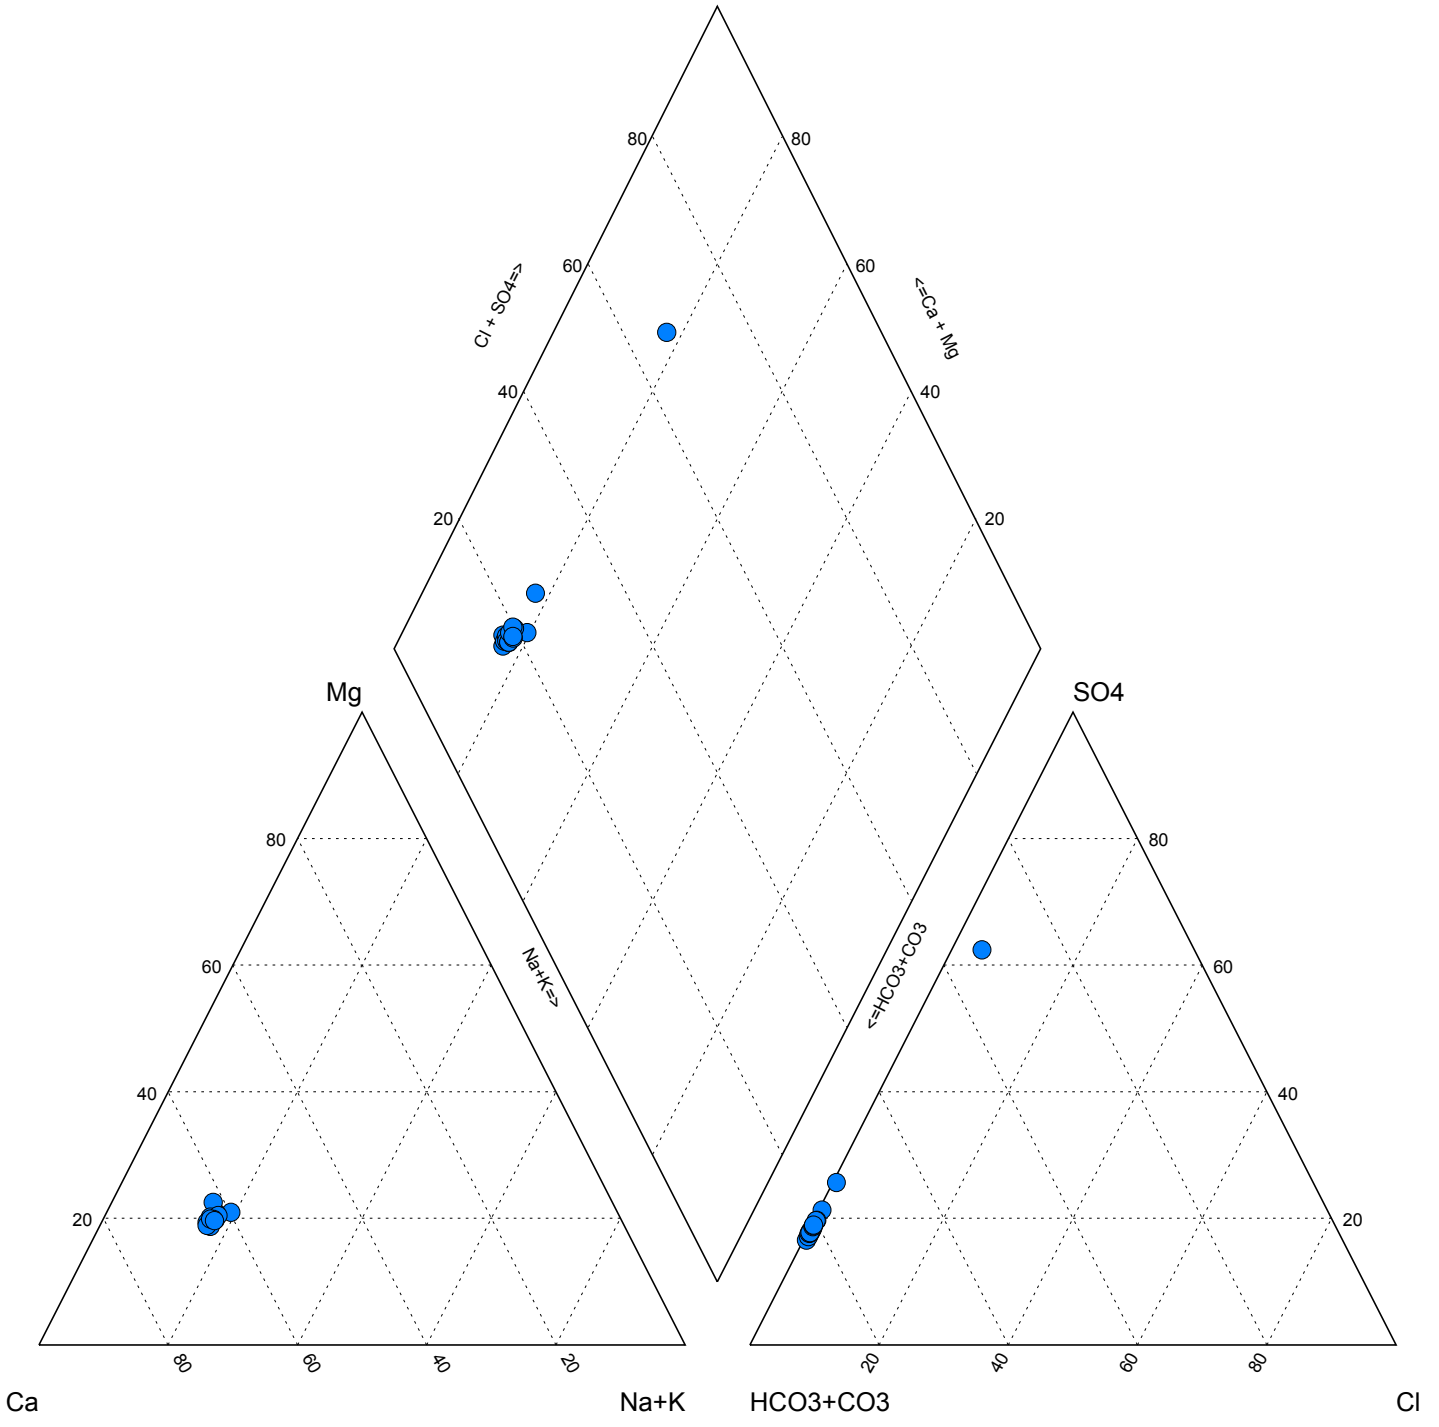
File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca



Notes:
1. The data set includes all results for individual samples for the years 2004-2008.
2. The axes of the Piper Plot indicate percentage of total milli-equivalents of ions.

Appendix 9.2E
Piper Plot of Well MW5D

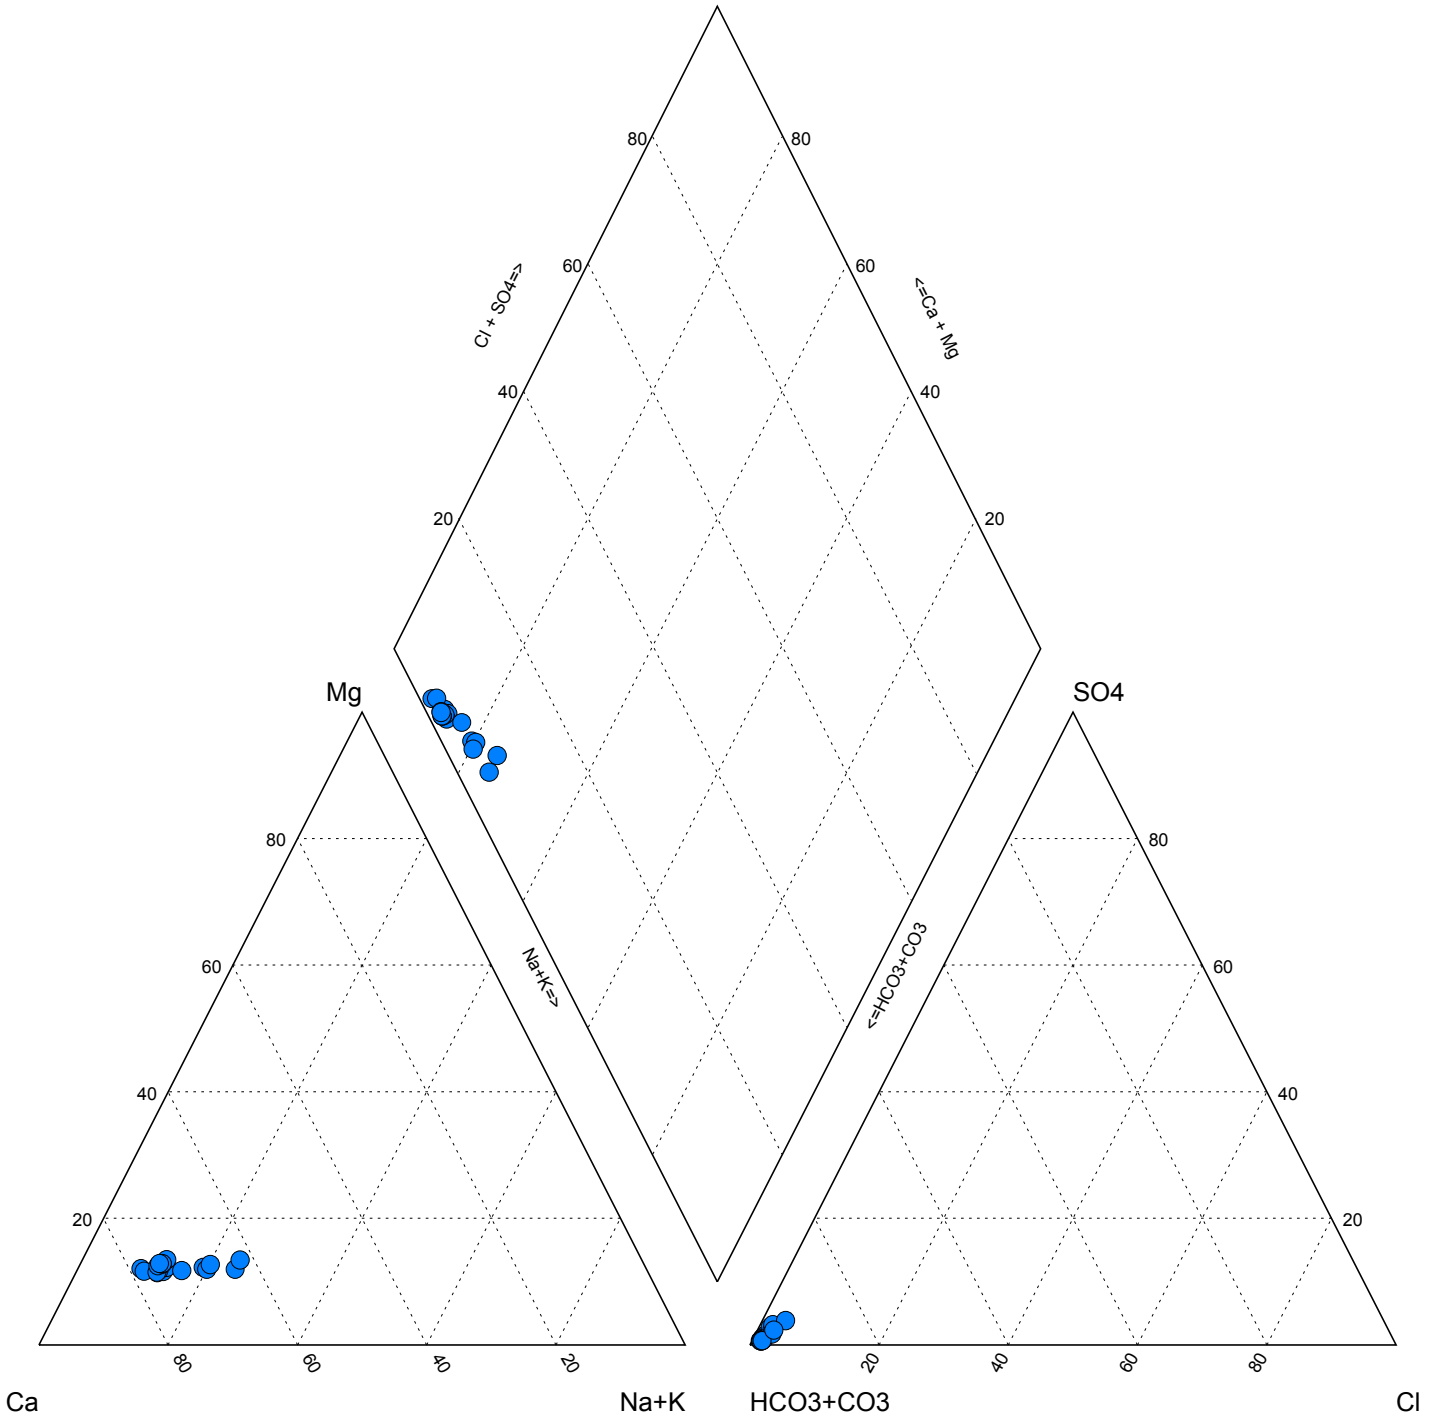
File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca



Notes:
1. The data set includes all results for individual samples for the years 2004-2008.
2. The axes of the Piper Plot indicate percentage of total milli-equivalents of ions.

Appendix 9.2E
Piper Plot of Well MW5M

File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca

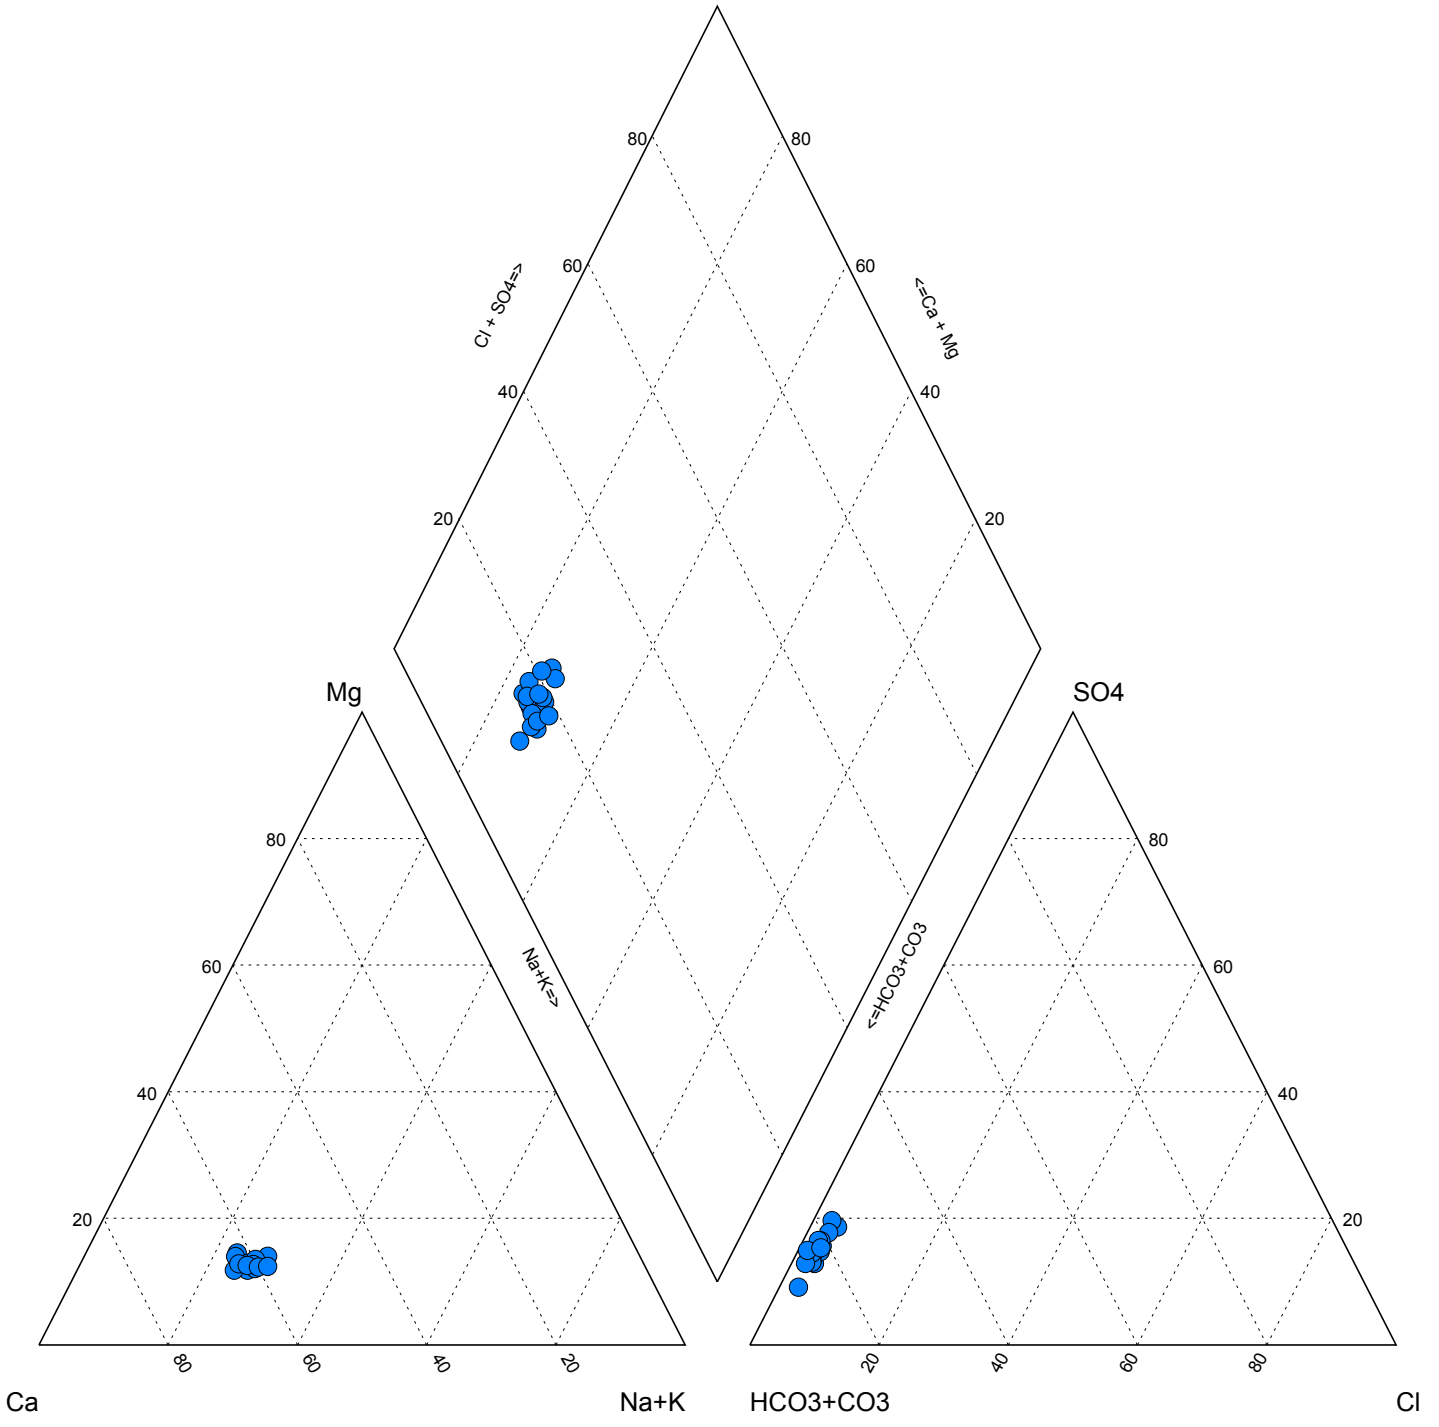


Notes:
1. The data set includes all results for individual samples for the years 2004-2008.
2. The axes of the Piper Plot indicate percentage of total milli-equivalents of ions.

THE pebble PARTNERSHIP

Appendix 9.2E
Piper Plot of Well MW5S

File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca

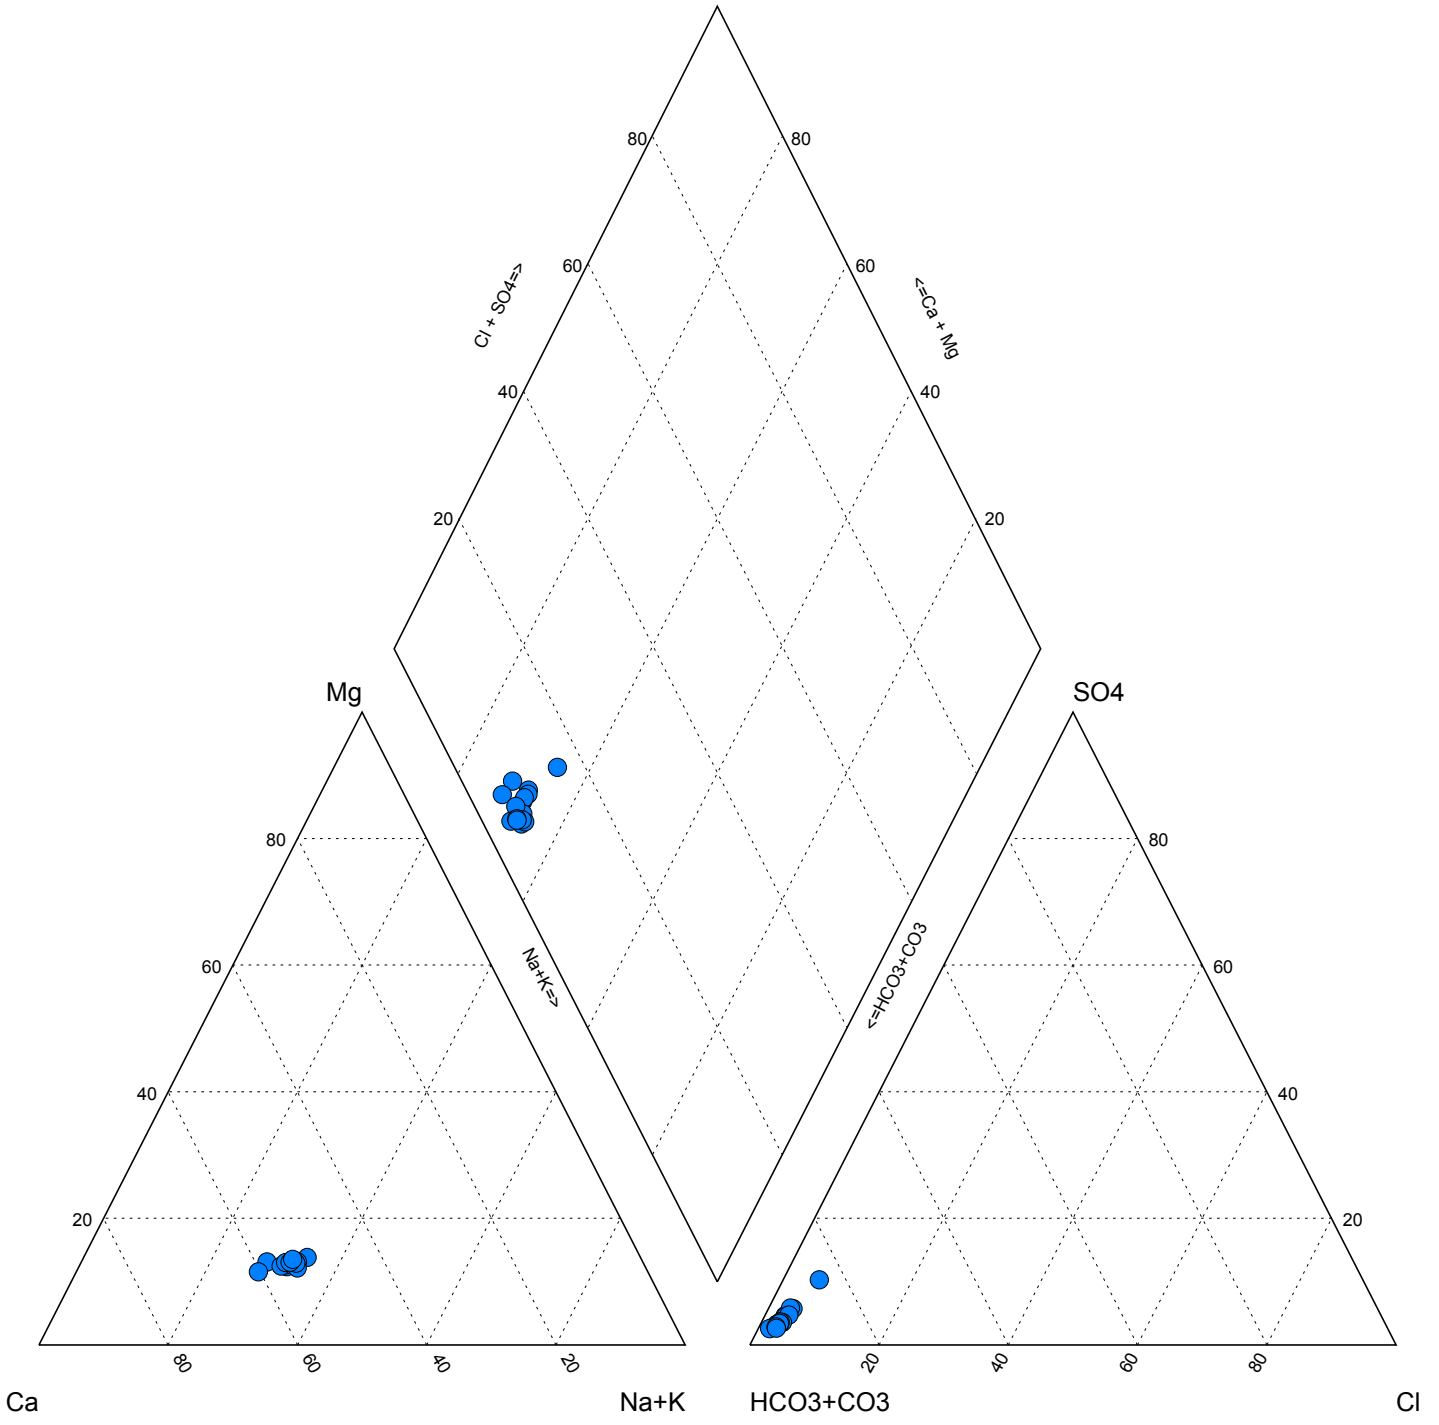


Notes:
1. The data set includes all results for individual samples for the years 2004-2008.
2. The axes of the Piper Plot indicate percentage of total milli-equivalents of ions.

THE pebble PARTNERSHIP

Appendix 9.2E
Piper Plot of Well MW6D

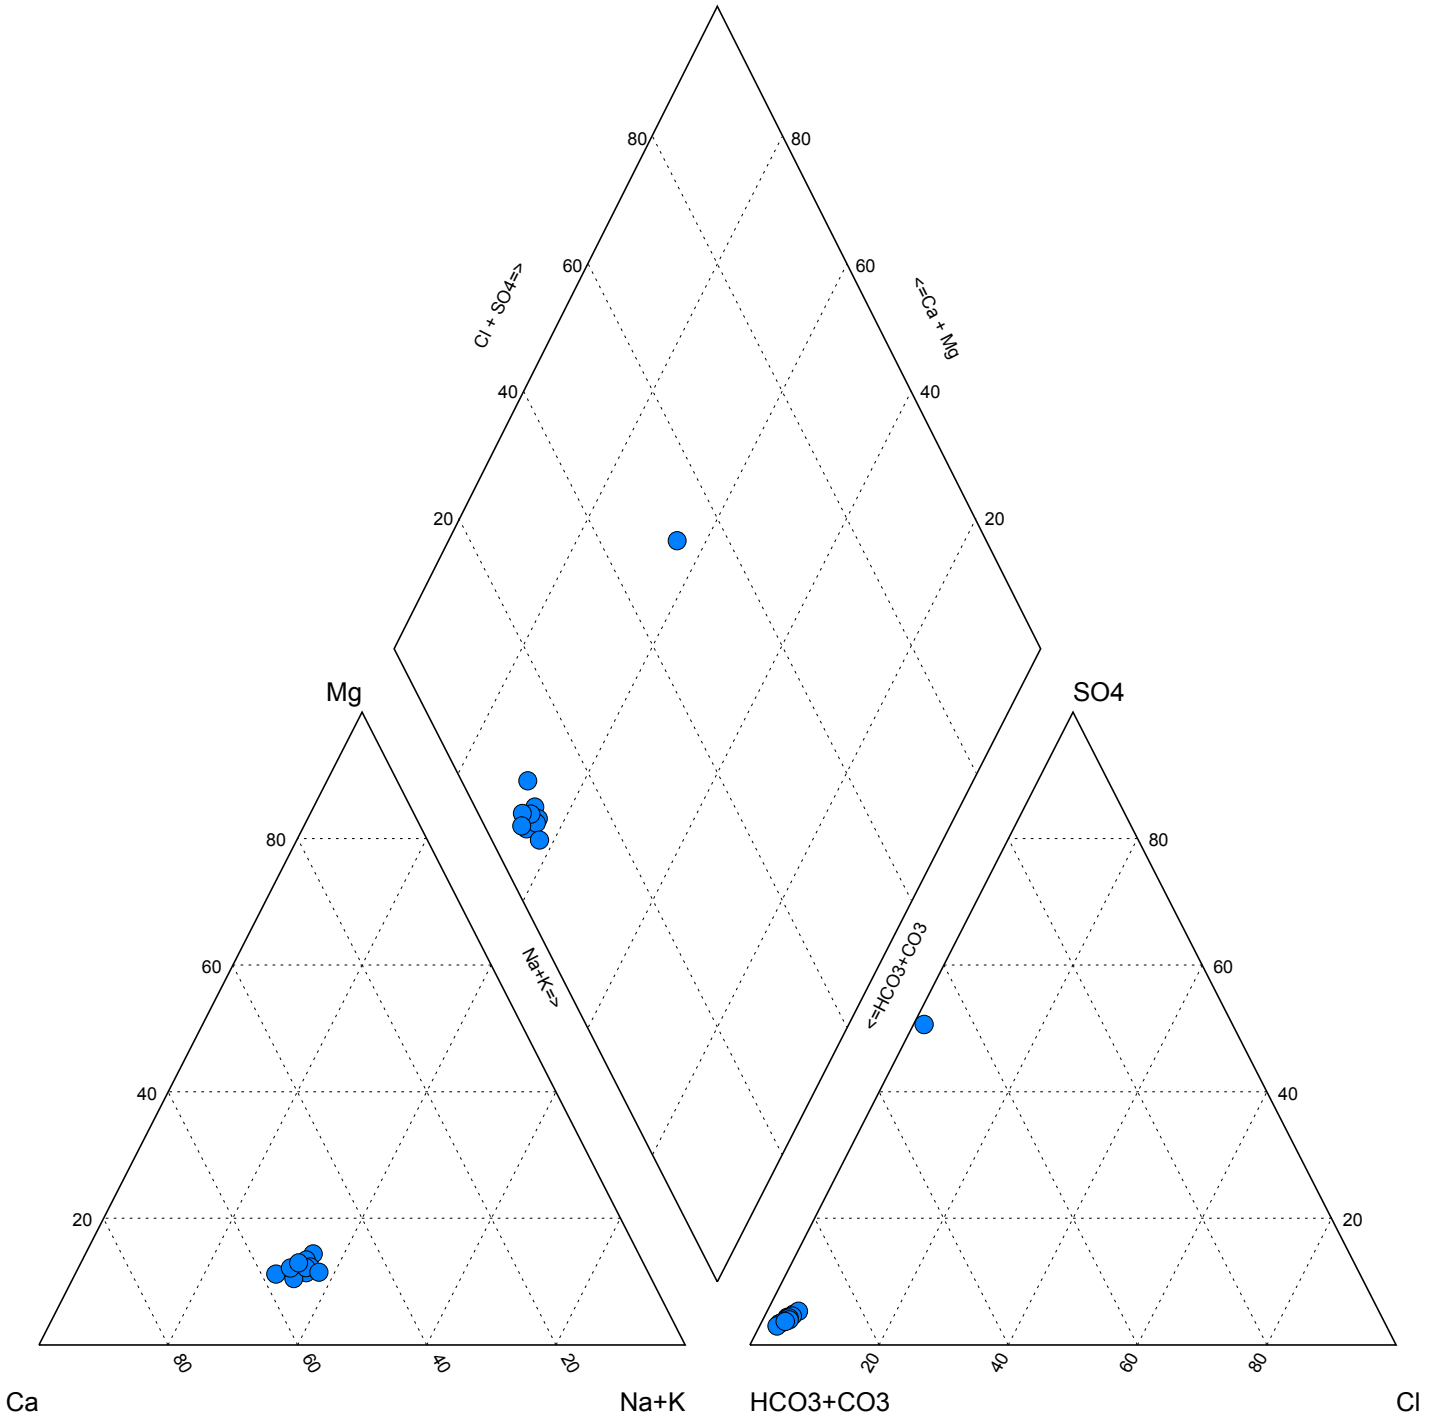
File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca



Notes:
1. The data set includes all results for individual samples for the years 2004-2008.
2. The axes of the Piper Plot indicate percentage of total milli-equivalents of ions.

Appendix 9.2E
Piper Plot of Well MW7D

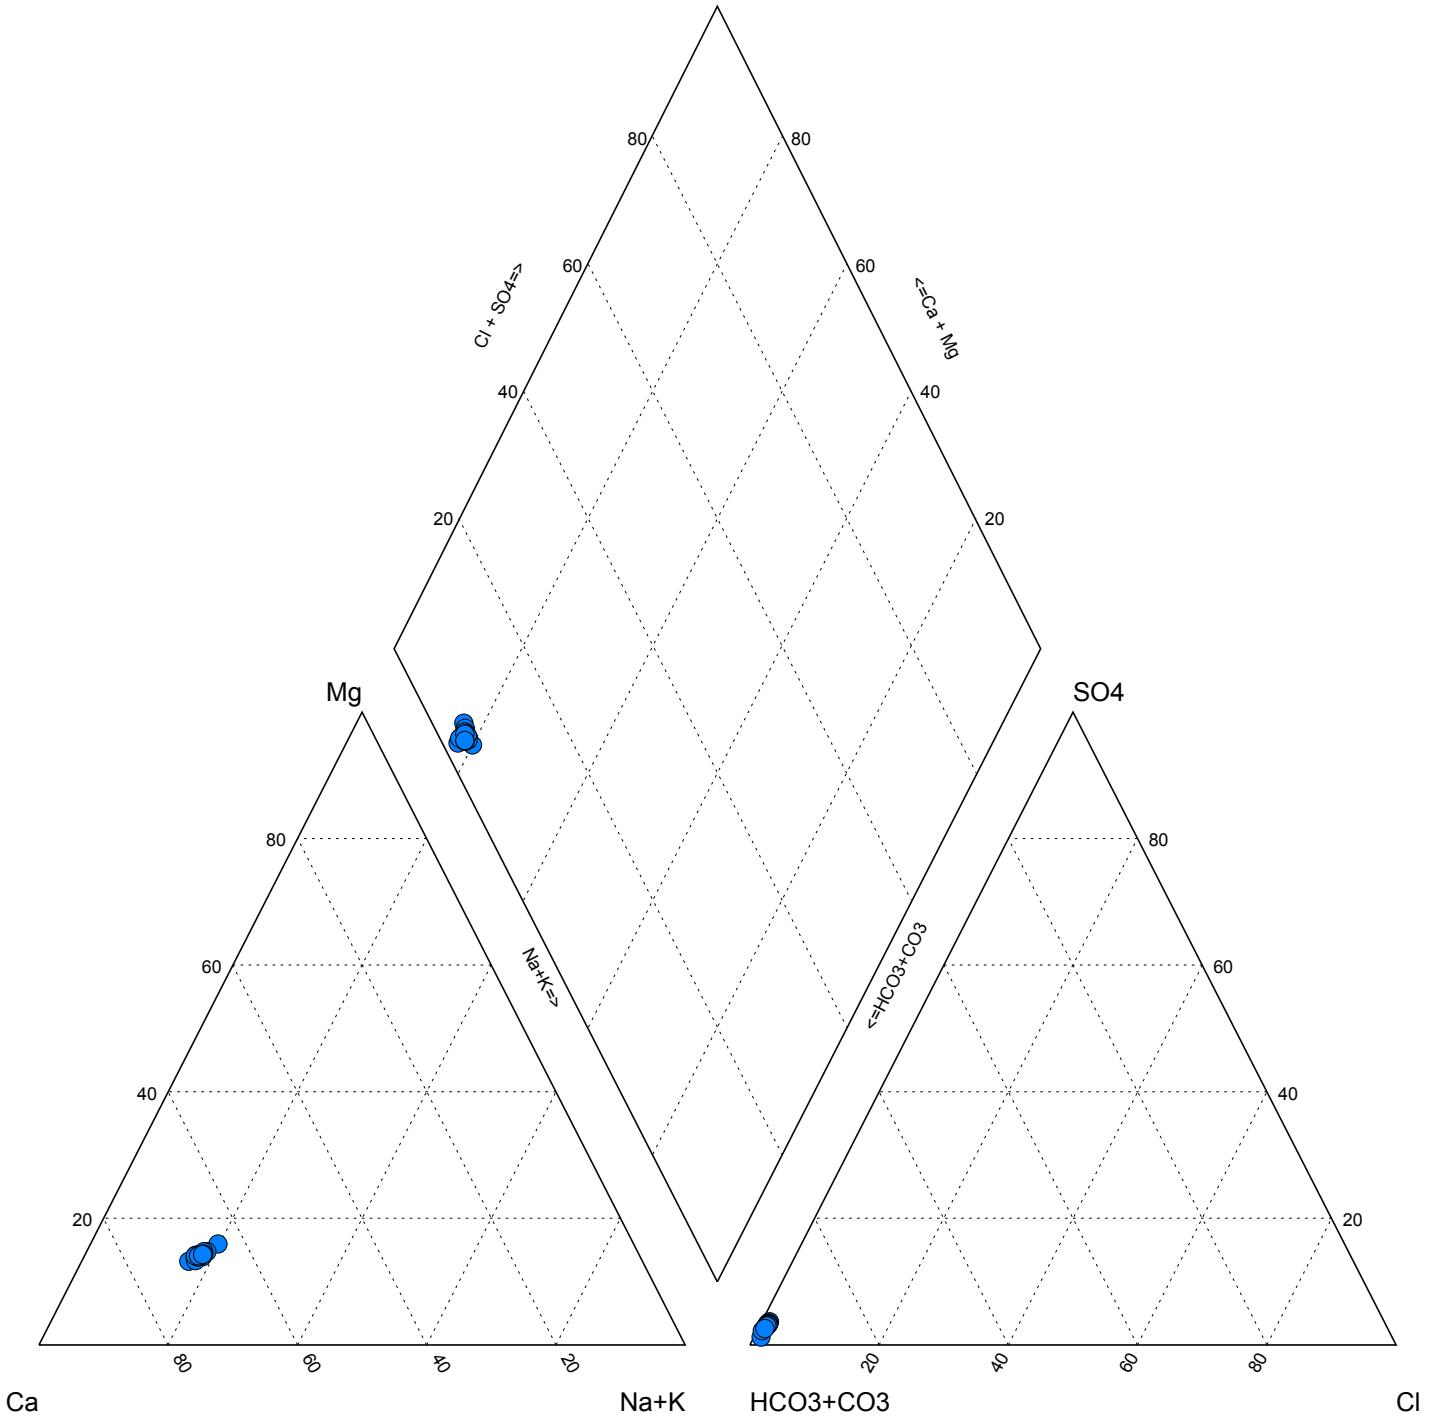
File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca



Notes:
1. The data set includes all results for individual samples for the years 2004-2008.
2. The axes of the Piper Plot indicate percentage of total milli-equivalents of ions.

Appendix 9.2E
Piper Plot of Well MW7S

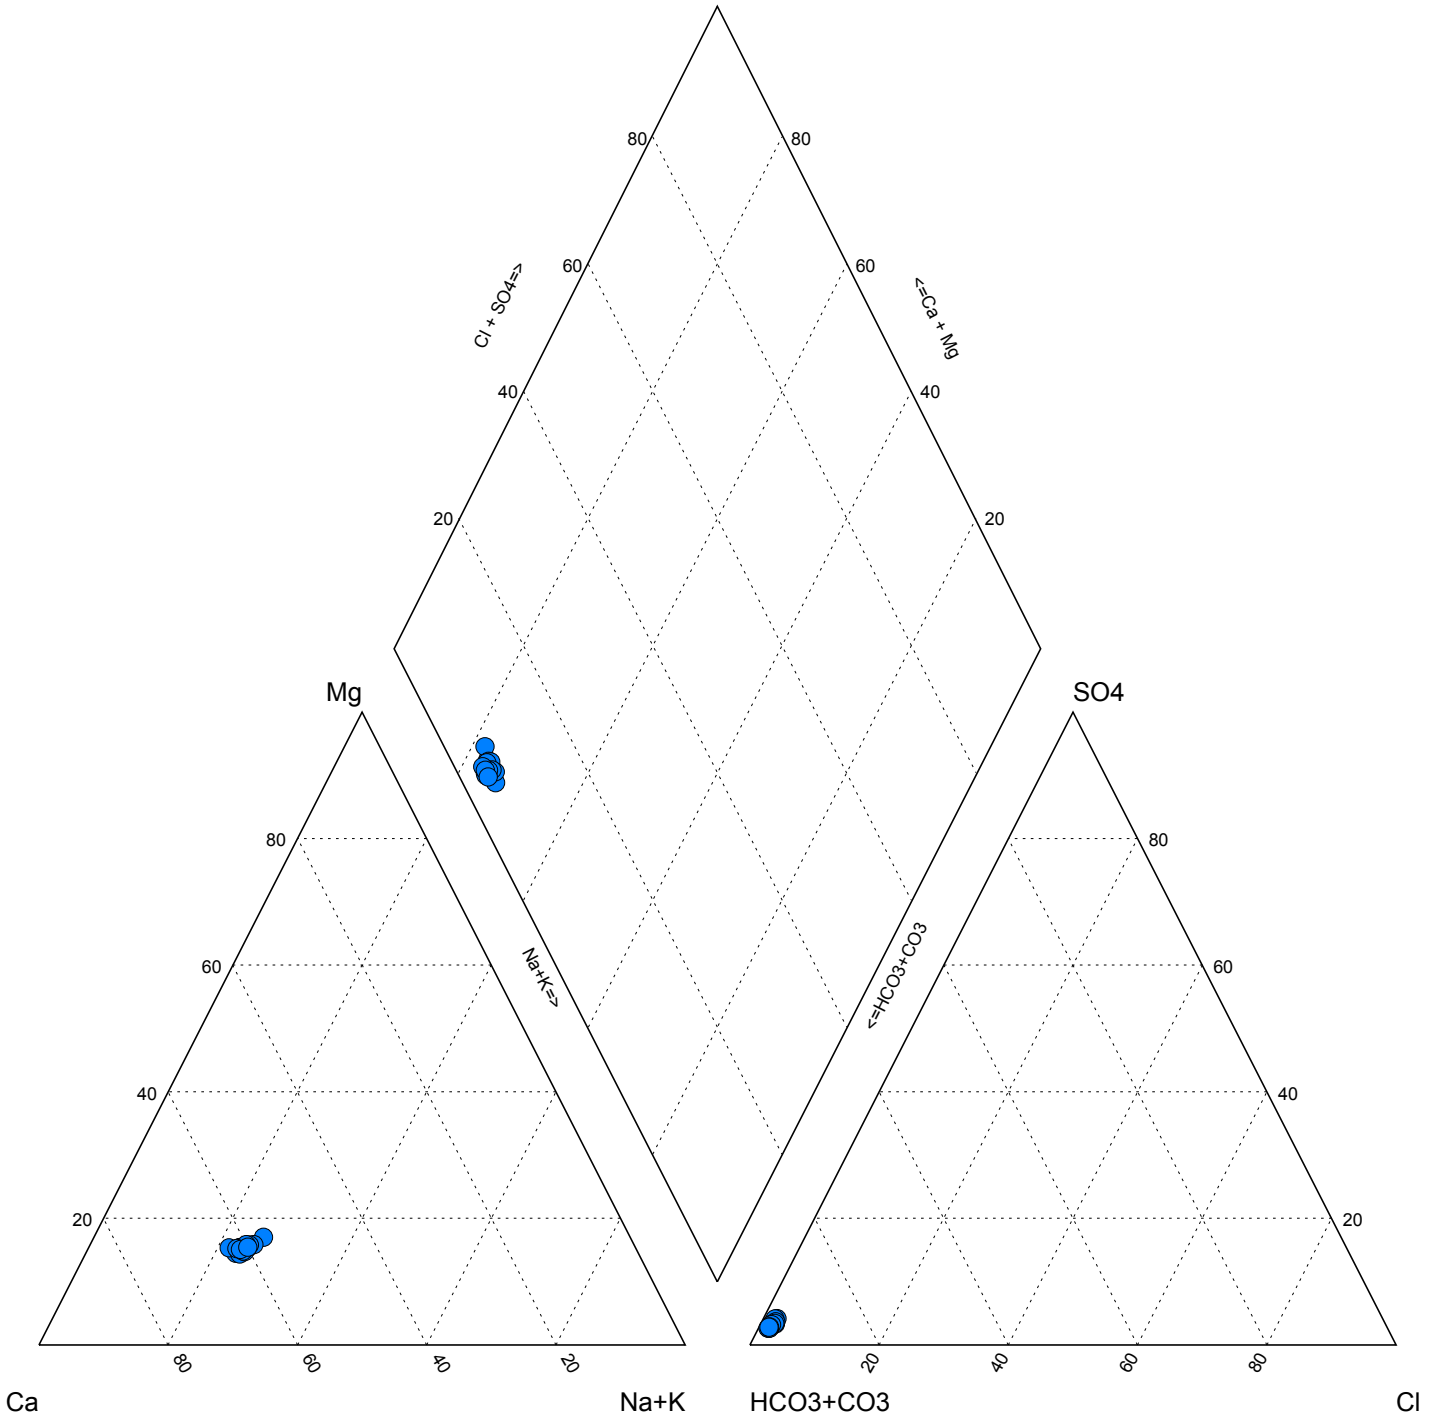
File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca



Notes:
1. The data set includes all results for individual samples for the years 2004-2008.
2. The axes of the Piper Plot indicate percentage of total milli-equivalents of ions.

Appendix 9.2E
Piper Plot of Well MW8D

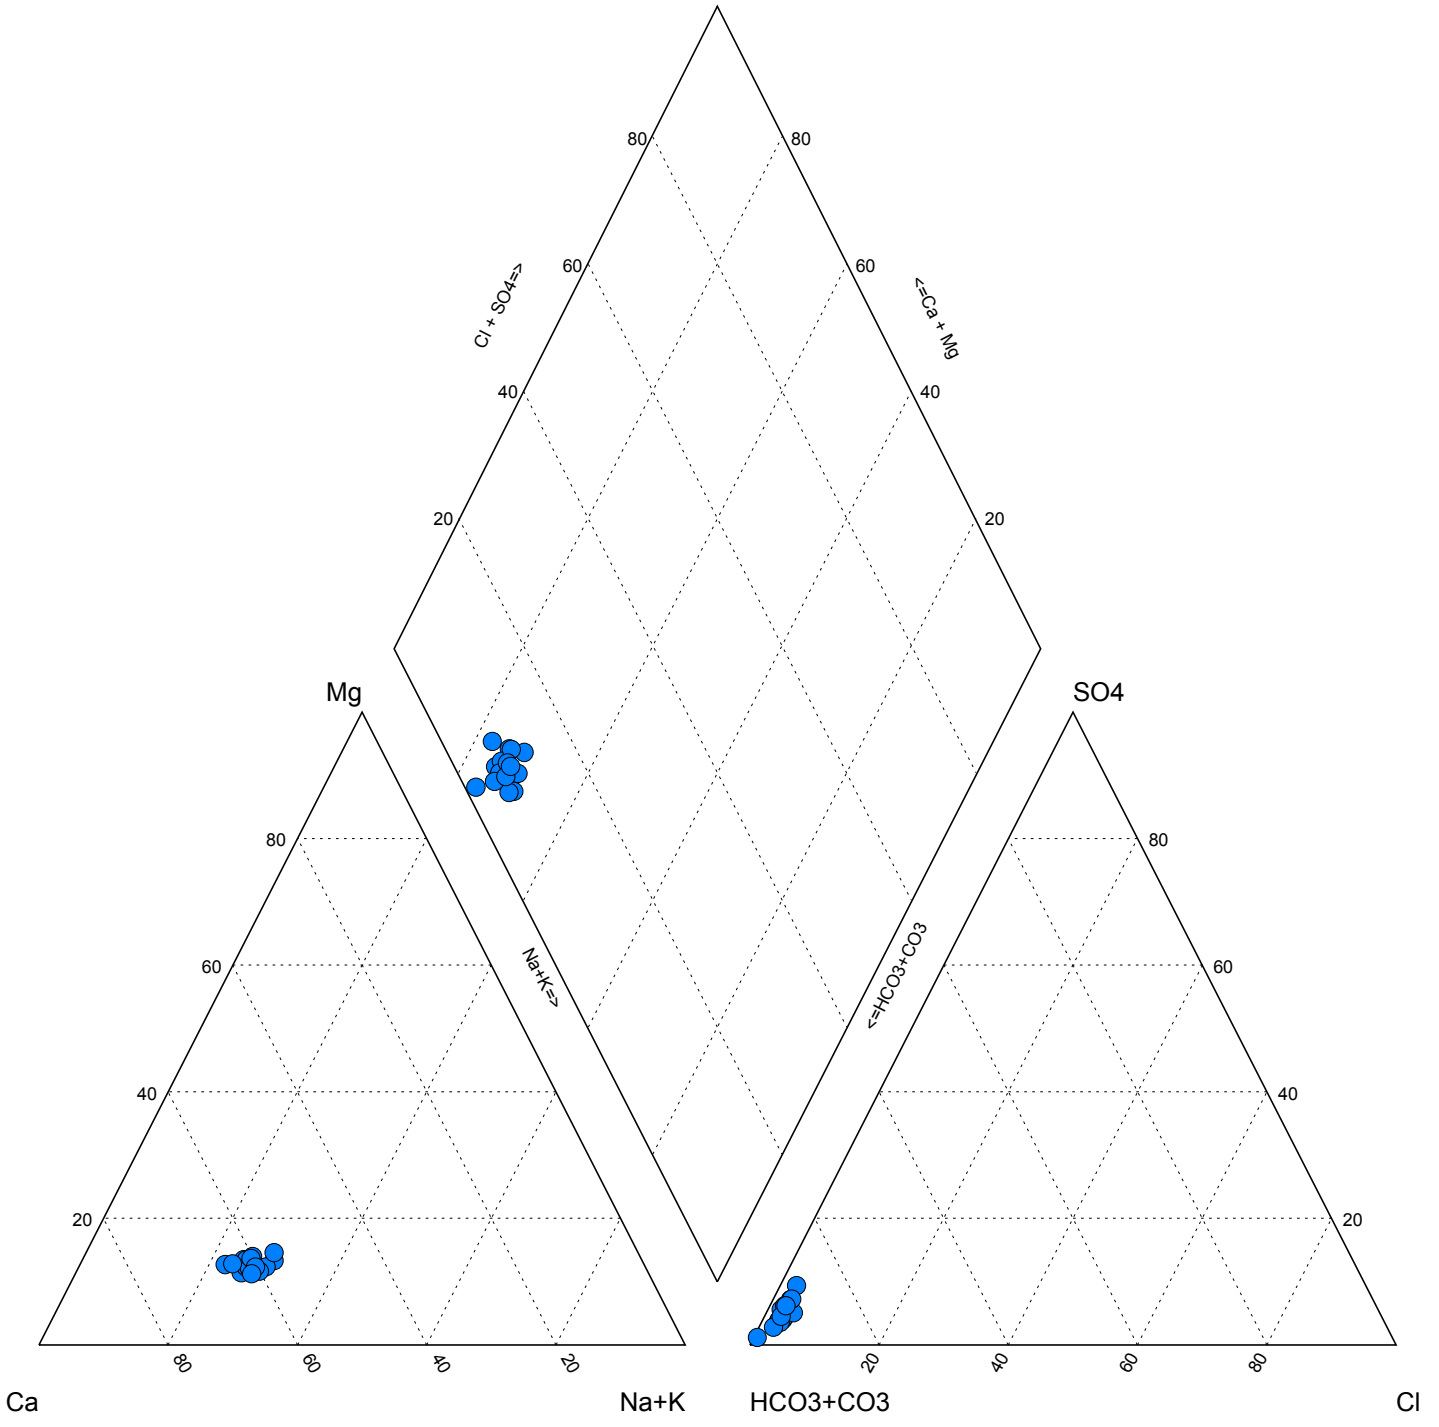
File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca



Notes:
1. The data set includes all results for individual samples for the years 2004-2008.
2. The axes of the Piper Plot indicate percentage of total milli-equivalents of ions.

Appendix 9.2E
Piper Plot of Well MW8M

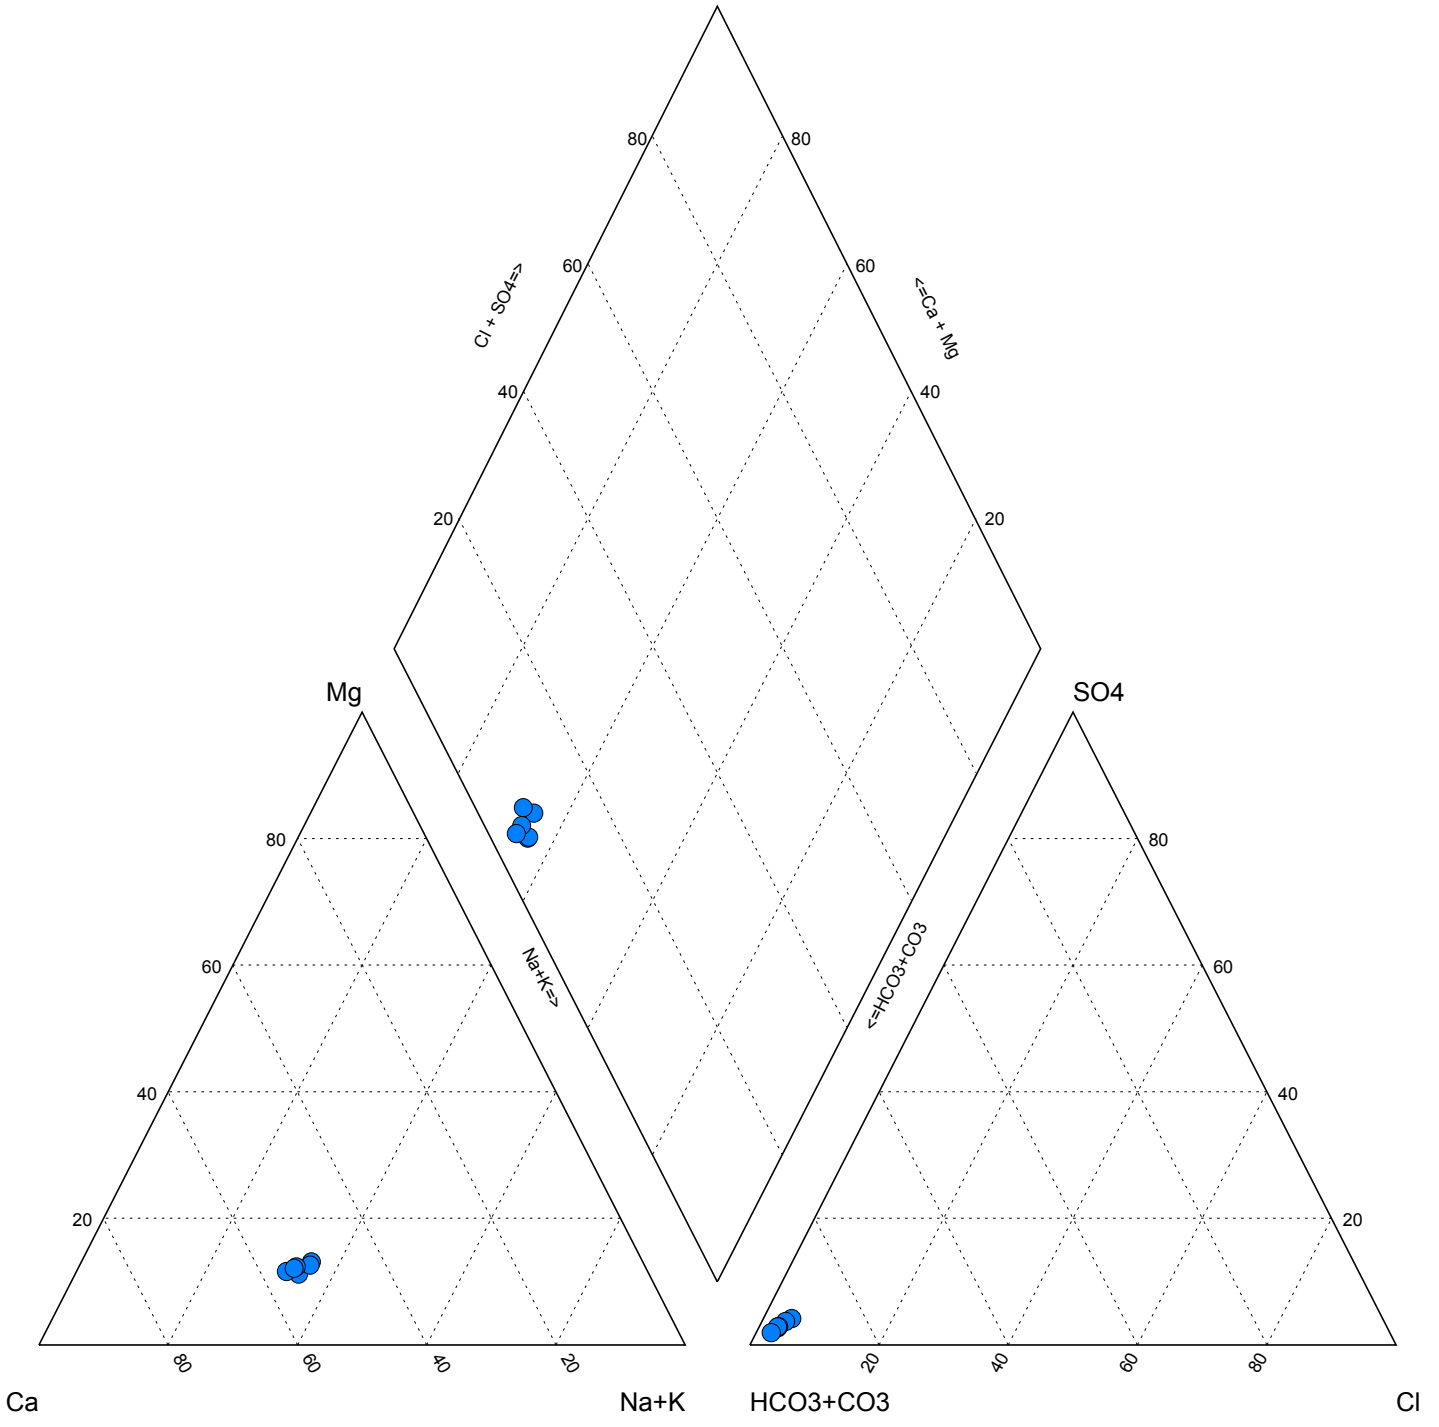
File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca



Notes:
1. The data set includes all results for individual samples for the years 2004-2008.
2. The axes of the Piper Plot indicate percentage of total milli-equivalents of ions.

Appendix 9.2E
Piper Plot of Well MW8S

File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca

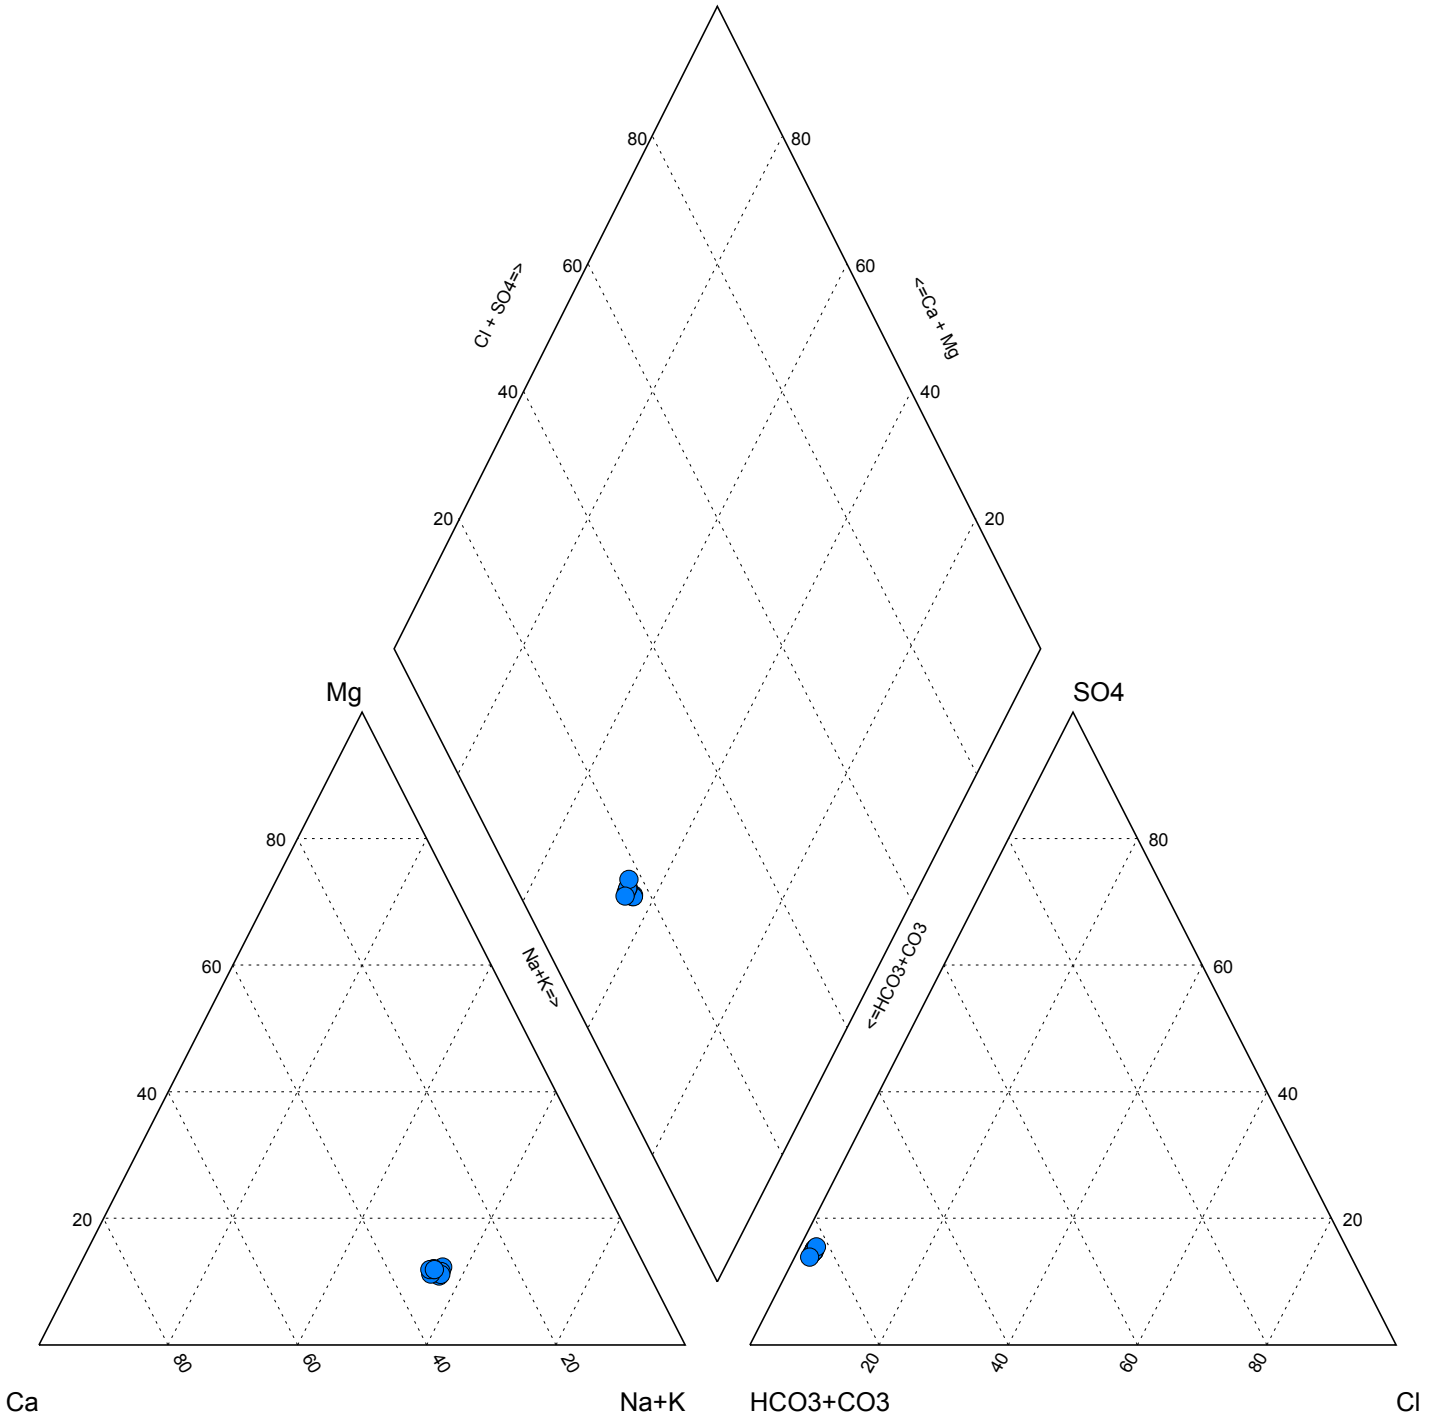


Notes:
1. The data set includes all results for individual samples for the years 2004-2008.
2. The axes of the Piper Plot indicate percentage of total milli-equivalents of ions.

THE pebble PARTNERSHIP

Appendix 9.2E
Piper Plot of Well MW9D

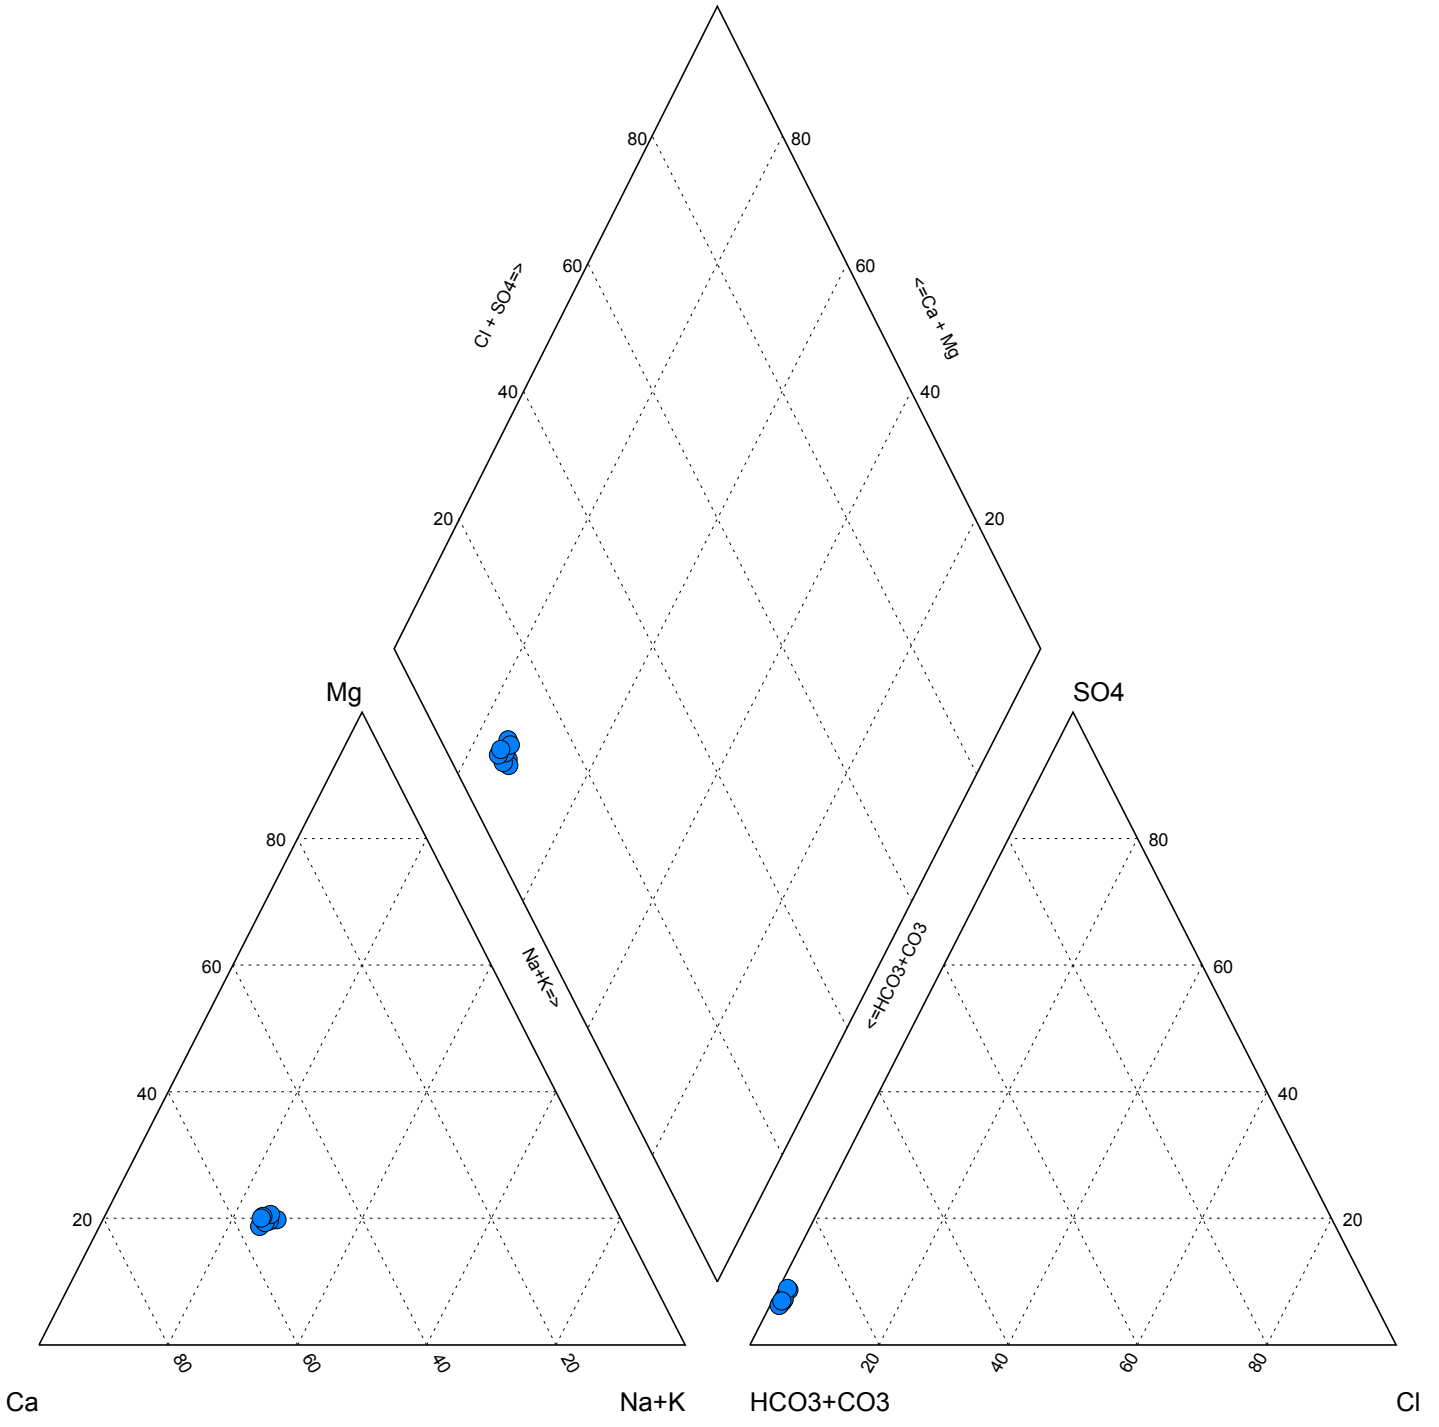
File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca



Notes:
1. The data set includes all results for individual samples for the years 2004-2008.
2. The axes of the Piper Plot indicate percentage of total milli-equivalents of ions.

Appendix 9.2E
Piper Plot of Well P0637D

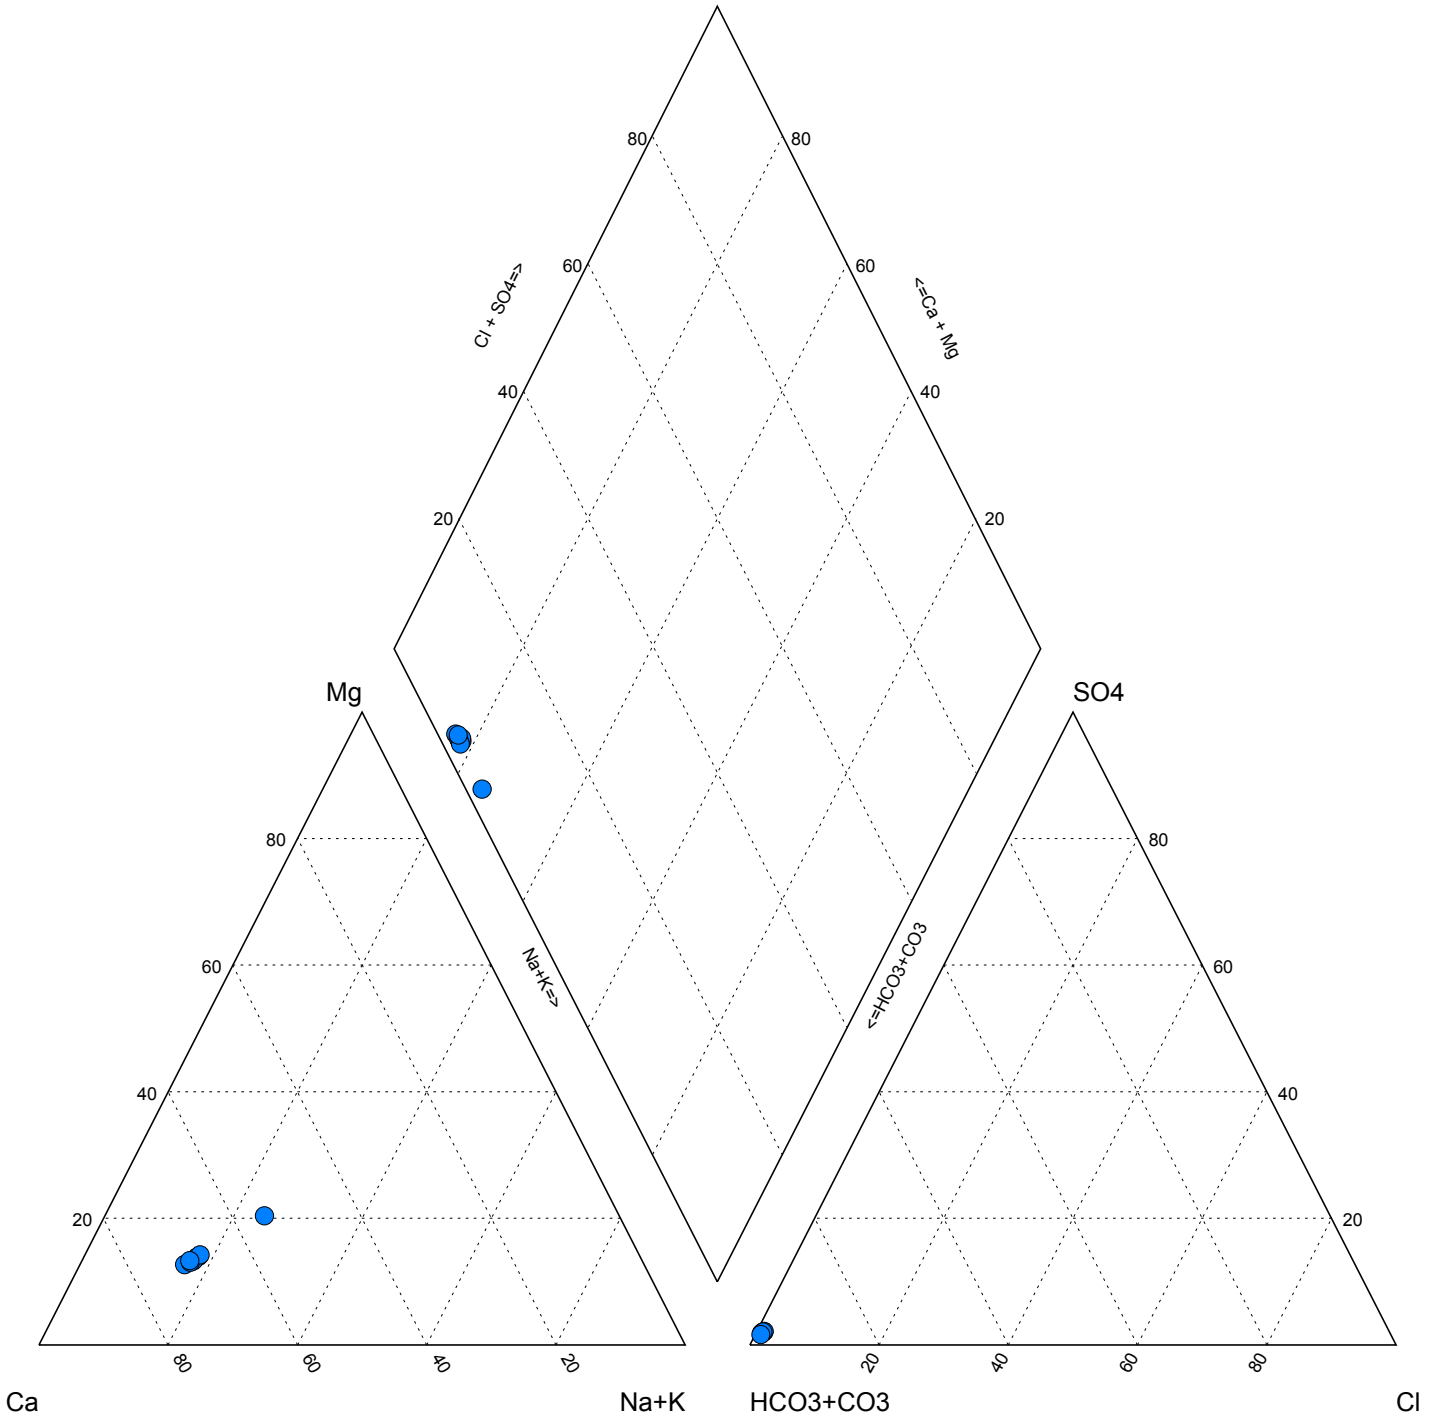
File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca



Notes:
1. The data set includes all results for individual samples for the years 2004-2008.
2. The axes of the Piper Plot indicate percentage of total milli-equivalents of ions.

Appendix 9.2E
Piper Plot of Well P0637M

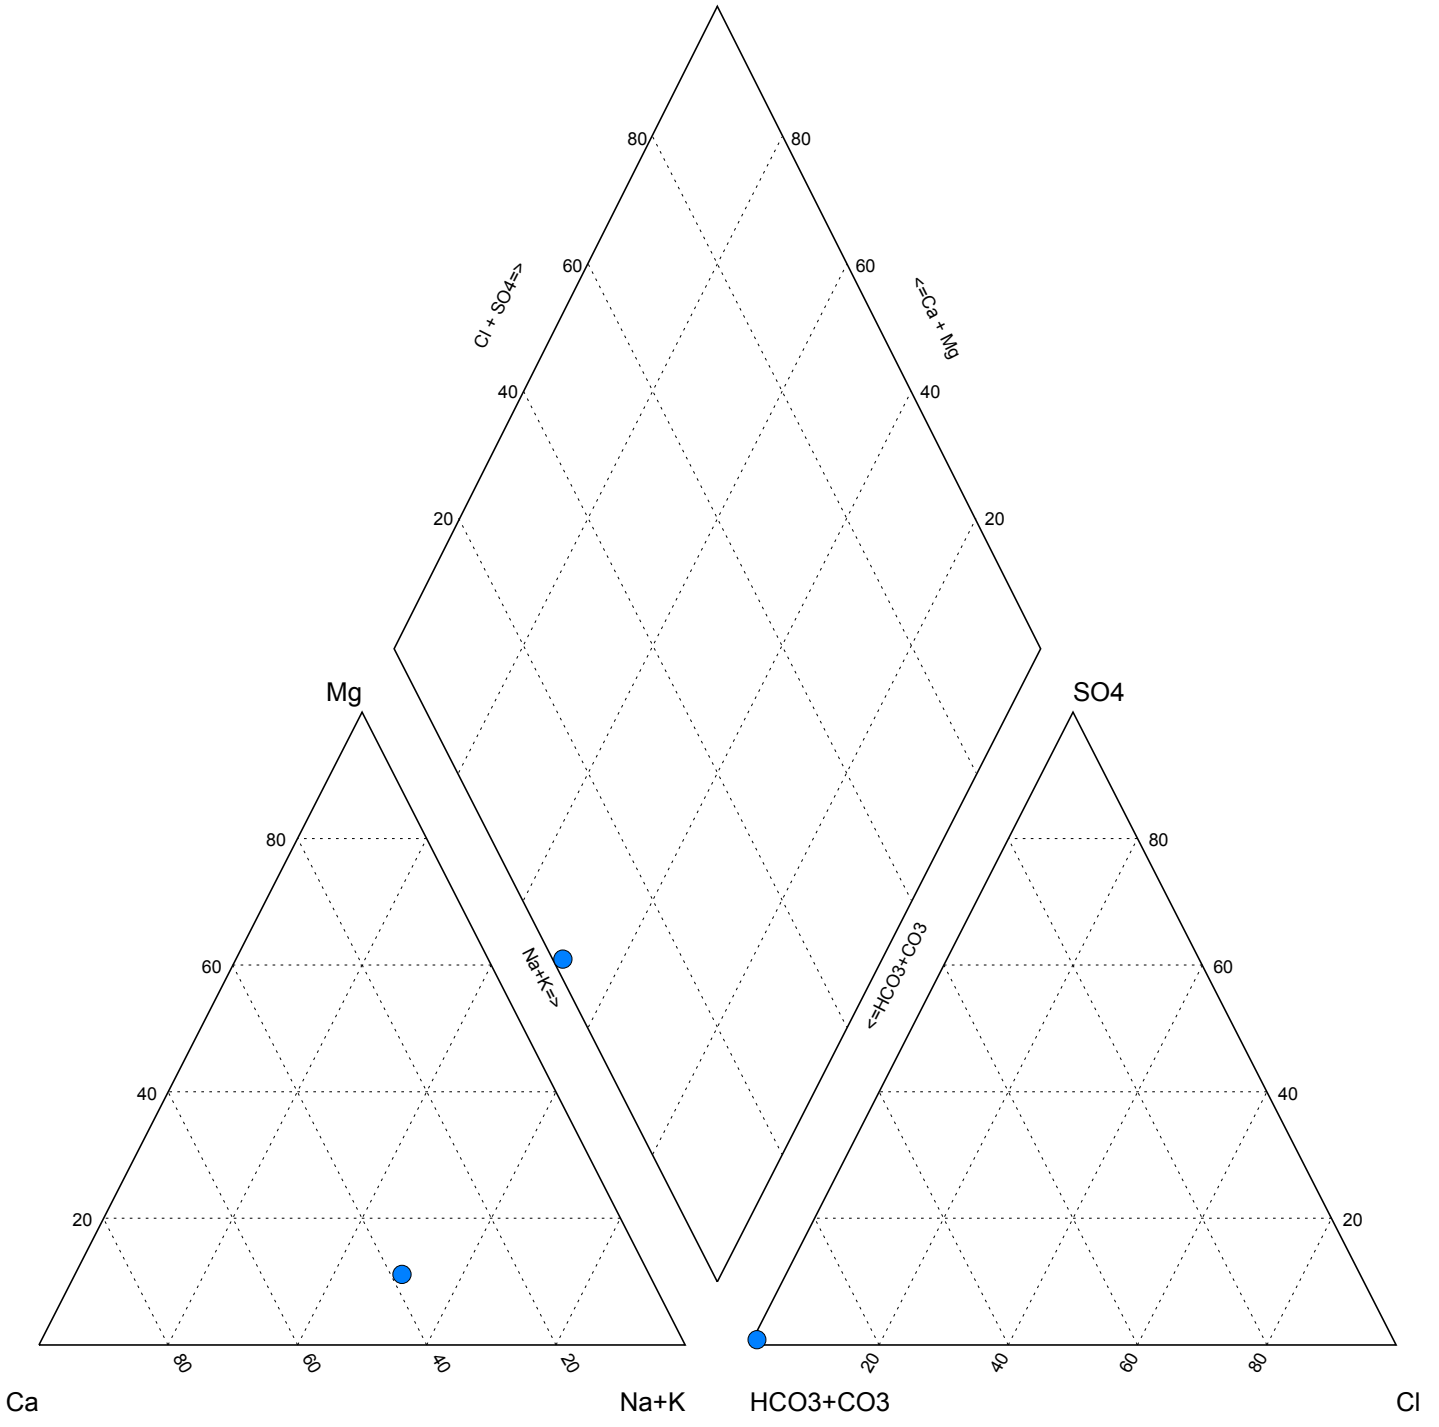
File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca



Notes:
1. The data set includes all results for individual samples for the years 2004-2008.
2. The axes of the Piper Plot indicate percentage of total milli-equivalents of ions.

Appendix 9.2E
Piper Plot of Well P0637S

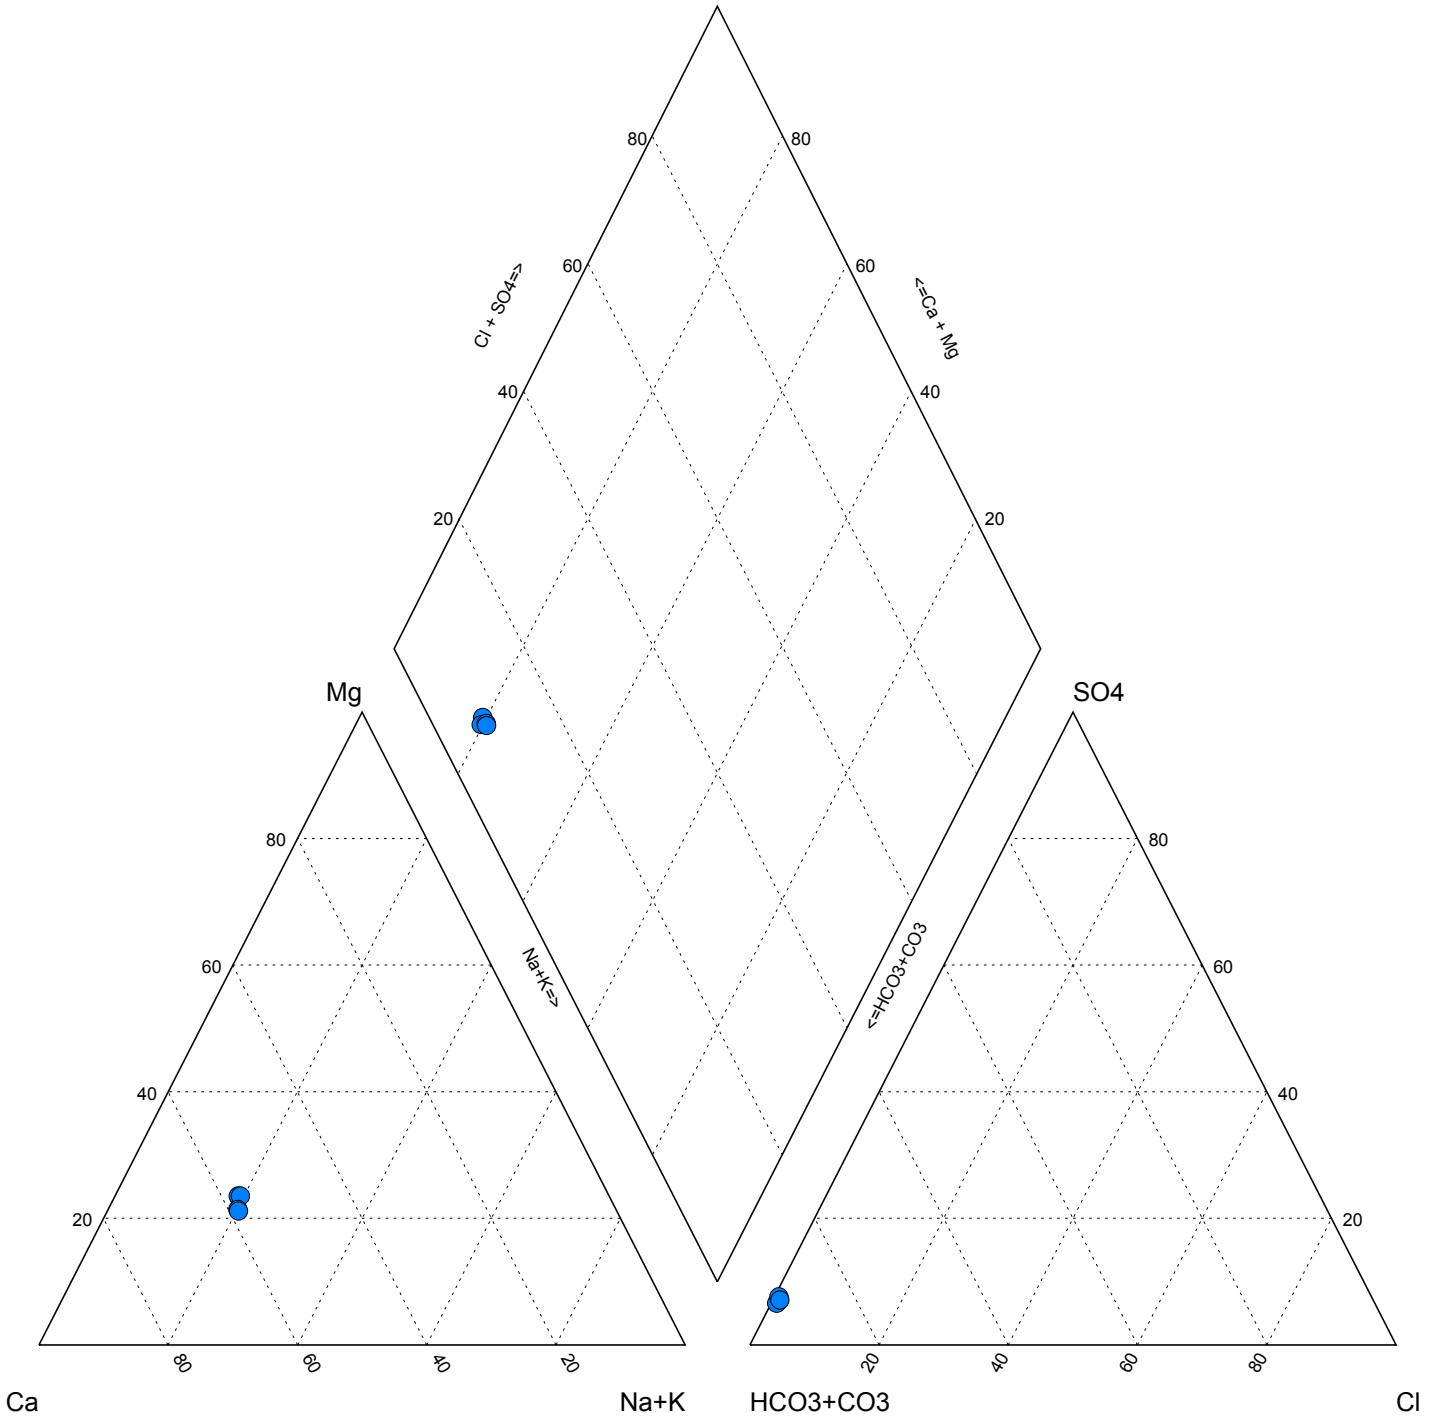
File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca



Notes:
1. The data set includes all results for individual samples for the years 2004-2008.
2. The axes of the Piper Plot indicate percentage of total milli-equivalents of ions.

Appendix 9.2E
Piper Plot of Well P0638D

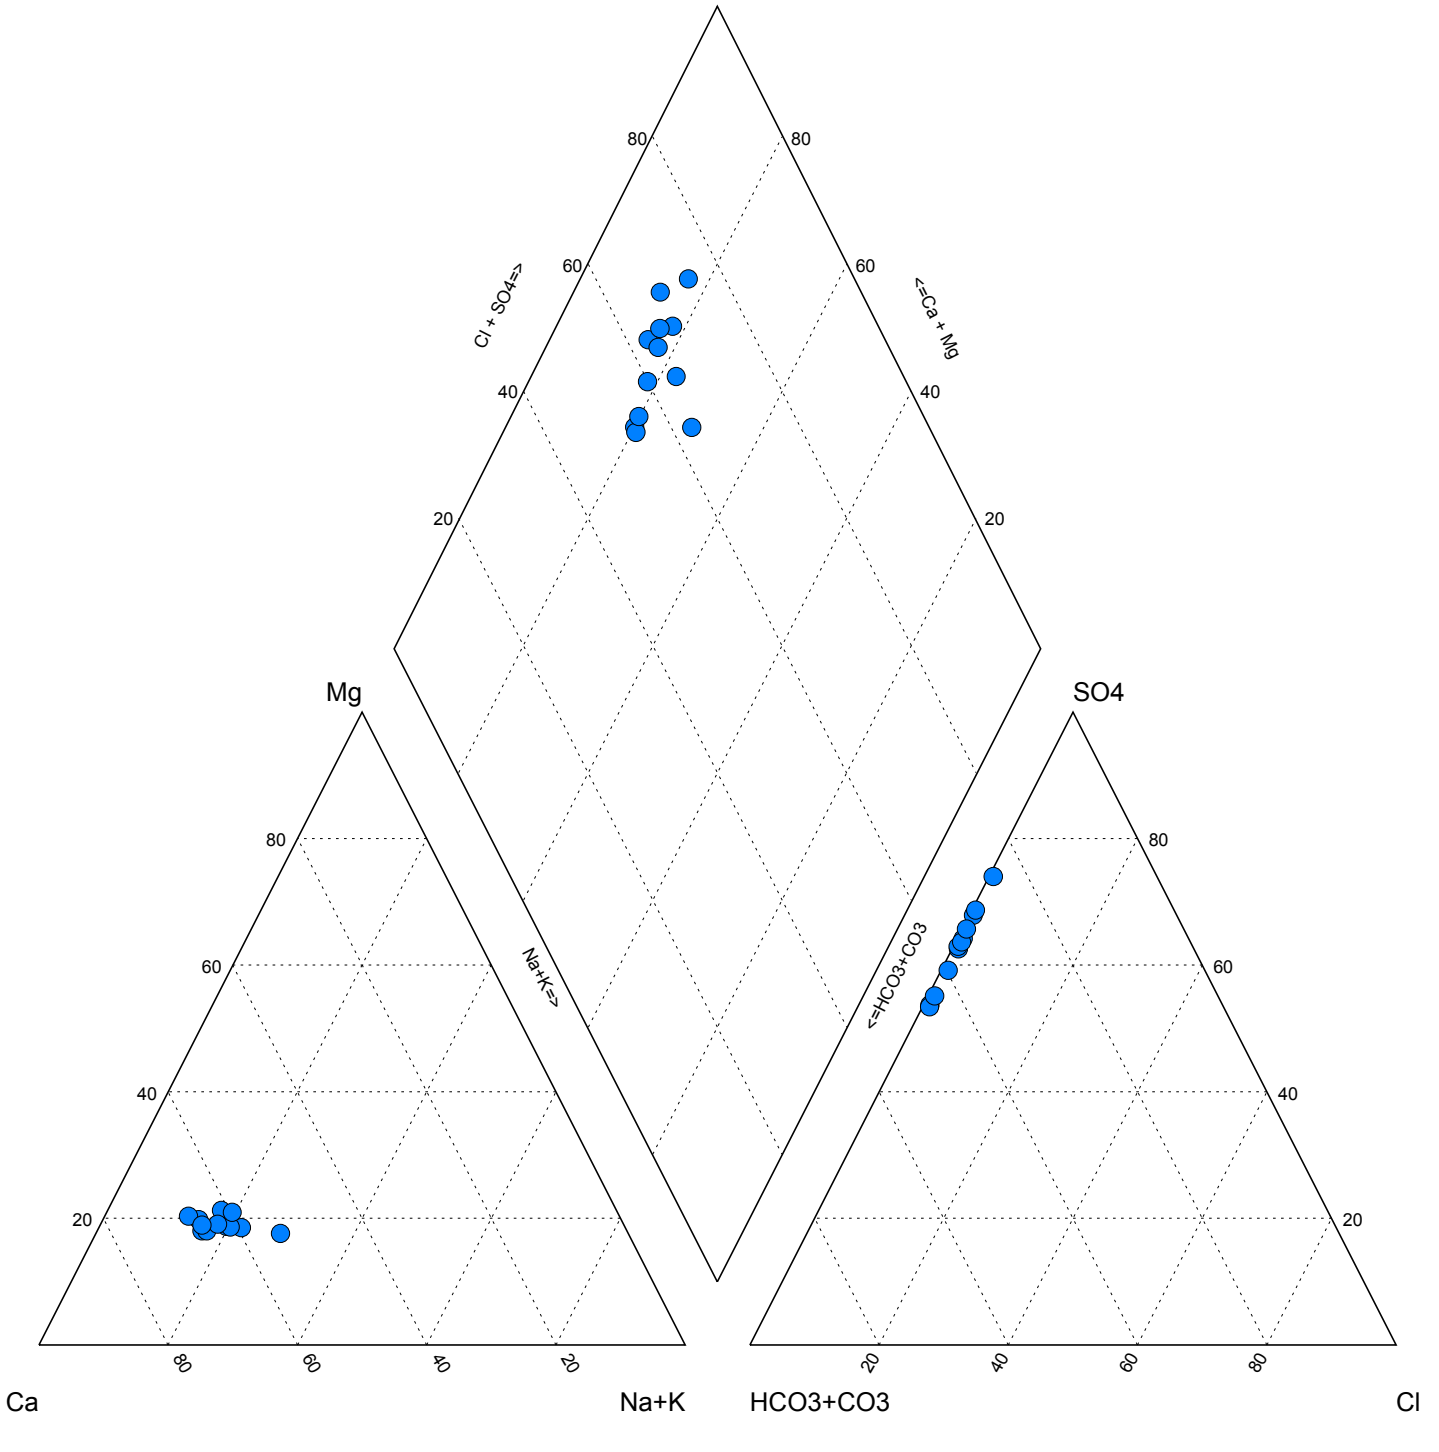
File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca



Notes:
1. The data set includes all results for individual samples for the years 2004-2008.
2. The axes of the Piper Plot indicate percentage of total milli-equivalents of ions.

Appendix 9.2E
Piper Plot of Well P0638m

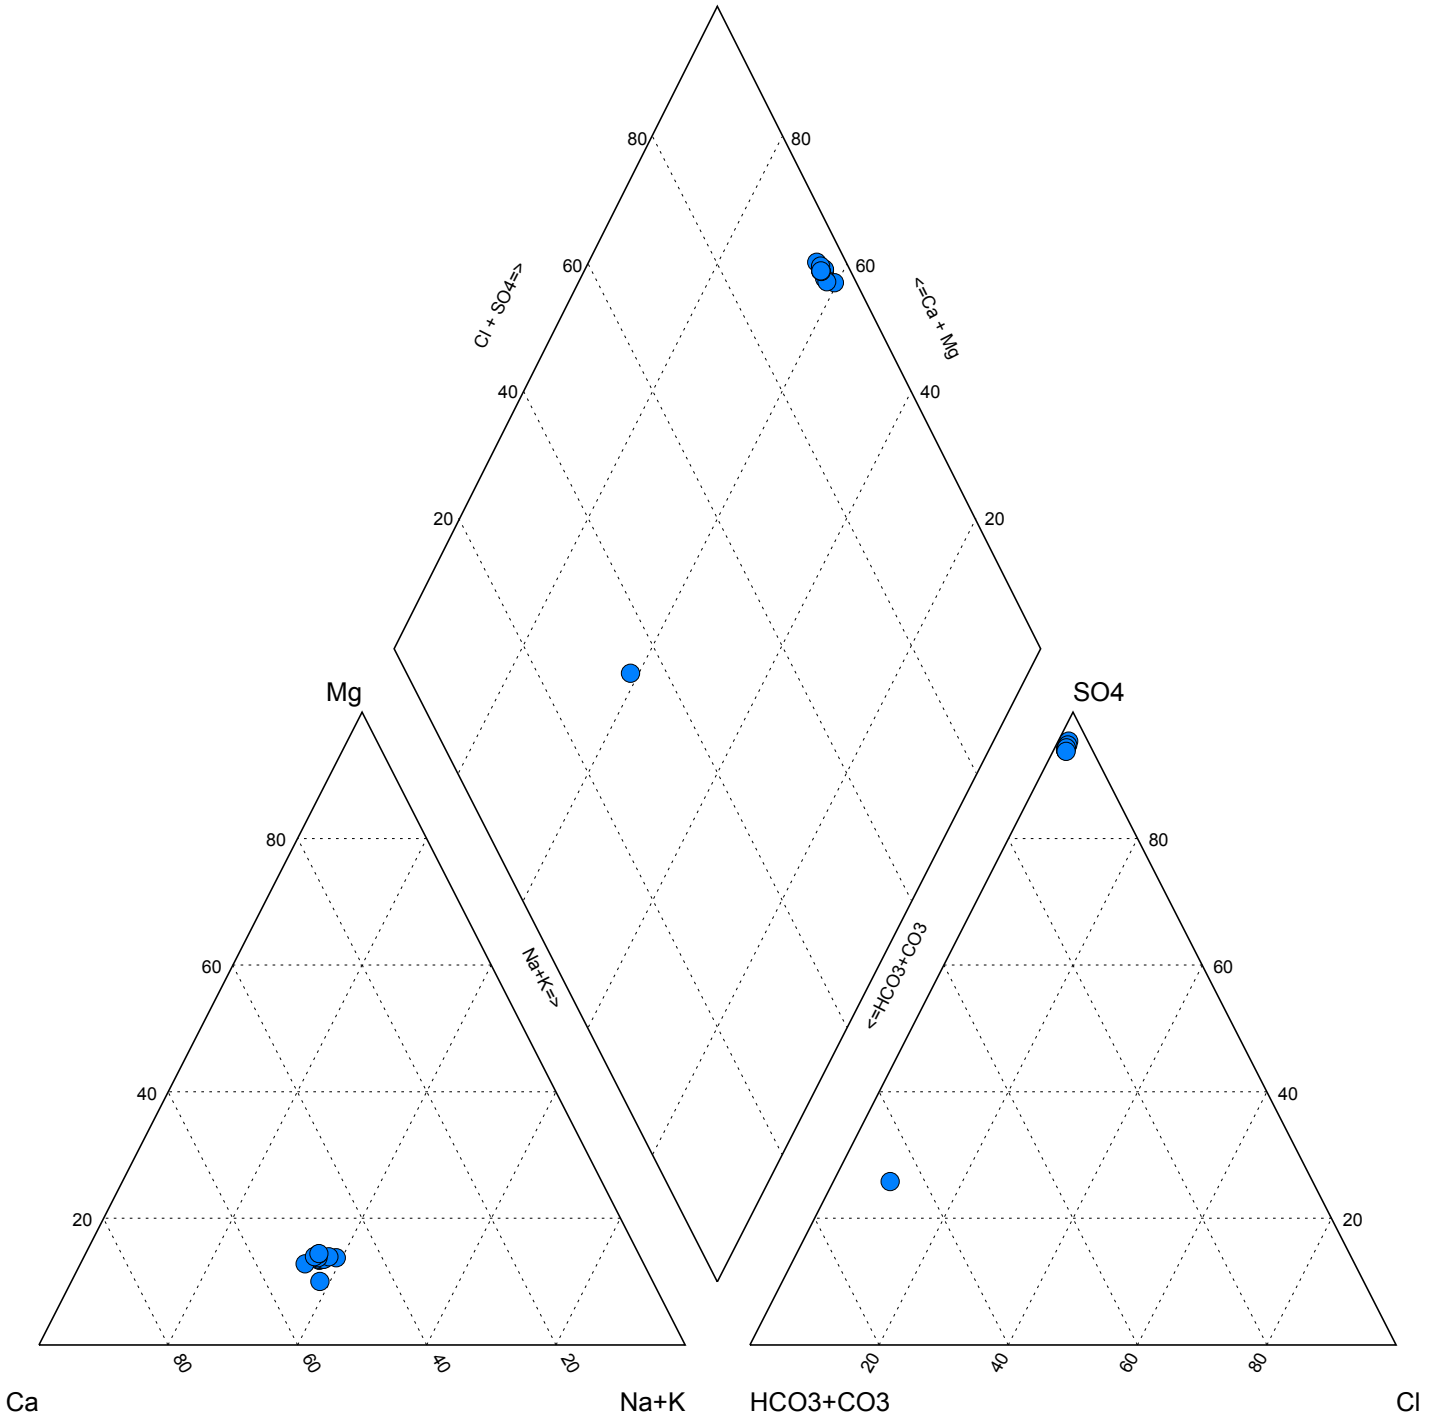
File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca



Notes:
1. The data set includes all results for individual samples for the years 2004-2008.
2. The axes of the Piper Plot indicate percentage of total milli-equivalents of ions.

Appendix 9.2E
Piper Plot of Well P4S

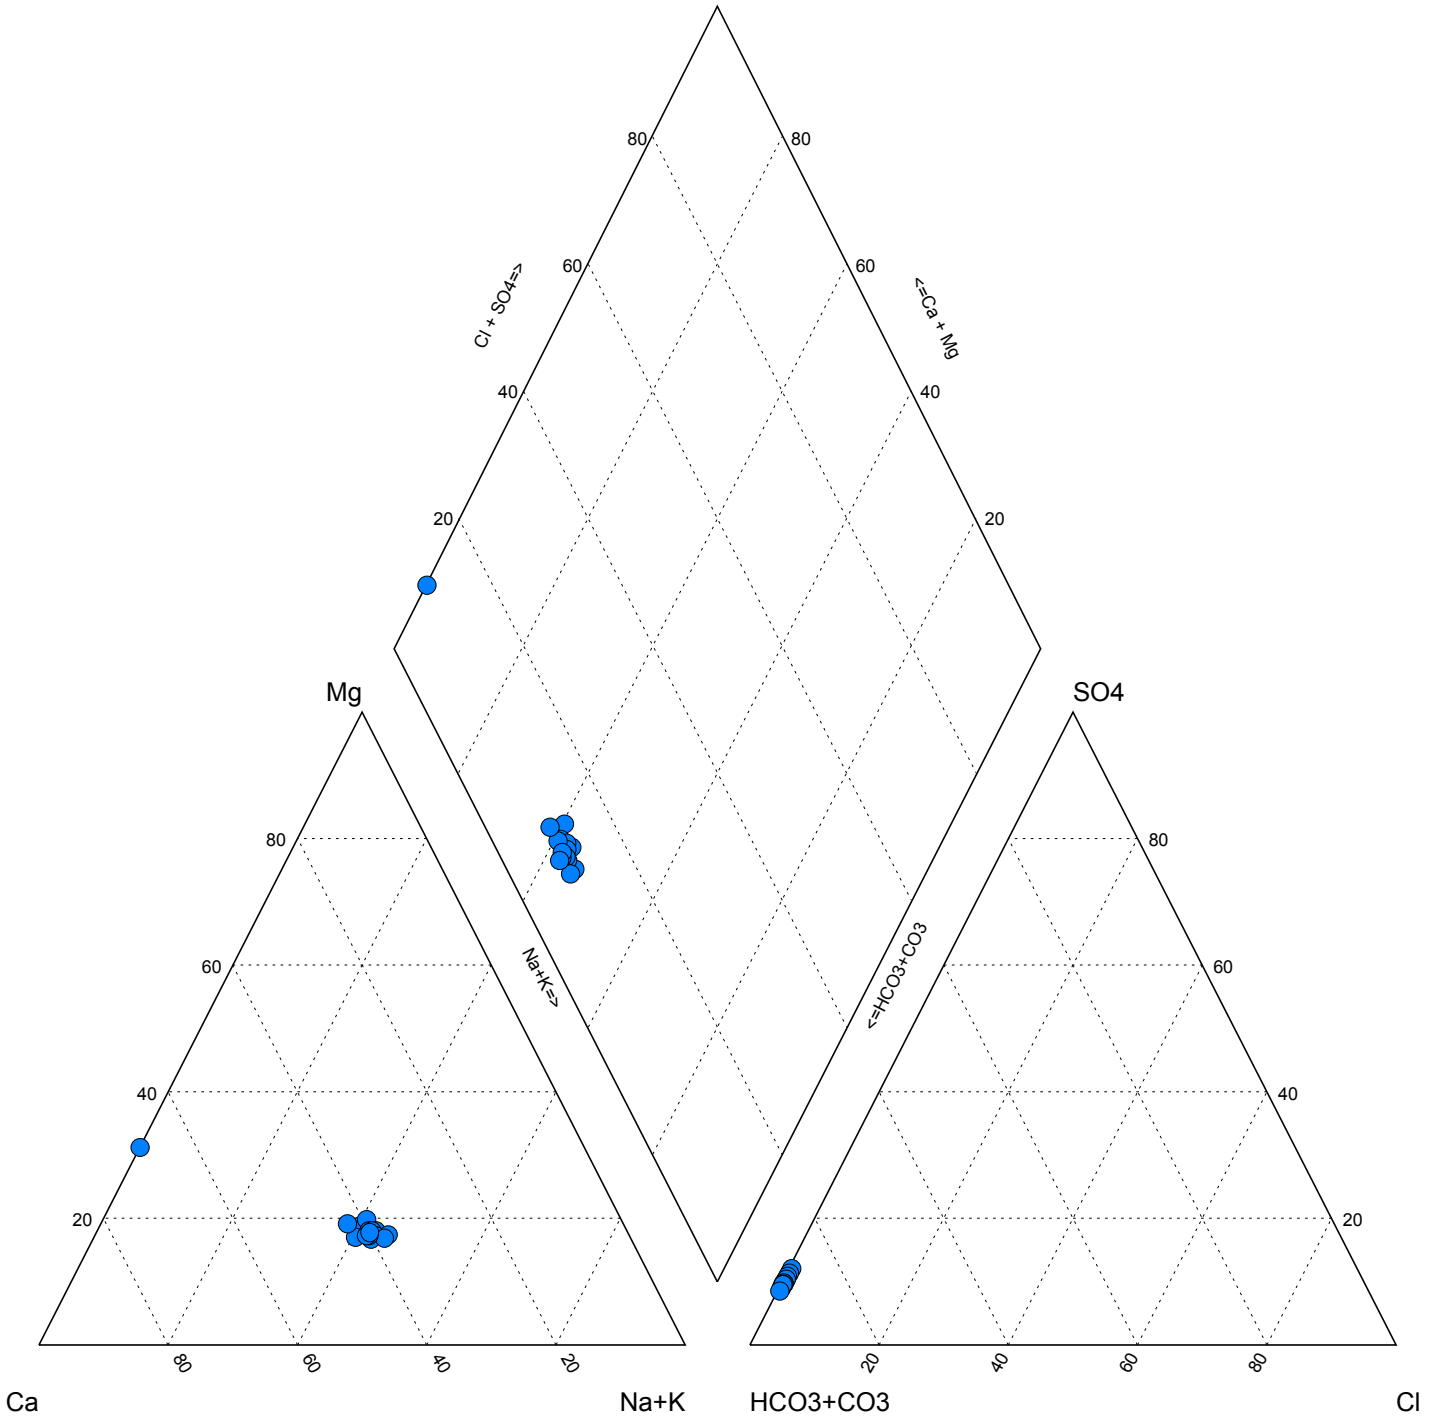
File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca



Notes:
1. The data set includes all results for individual samples for the years 2004-2008.
2. The axes of the Piper Plot indicate percentage of total milli-equivalents of ions.

Appendix 9.2E
Piper Plot of Well PQ4

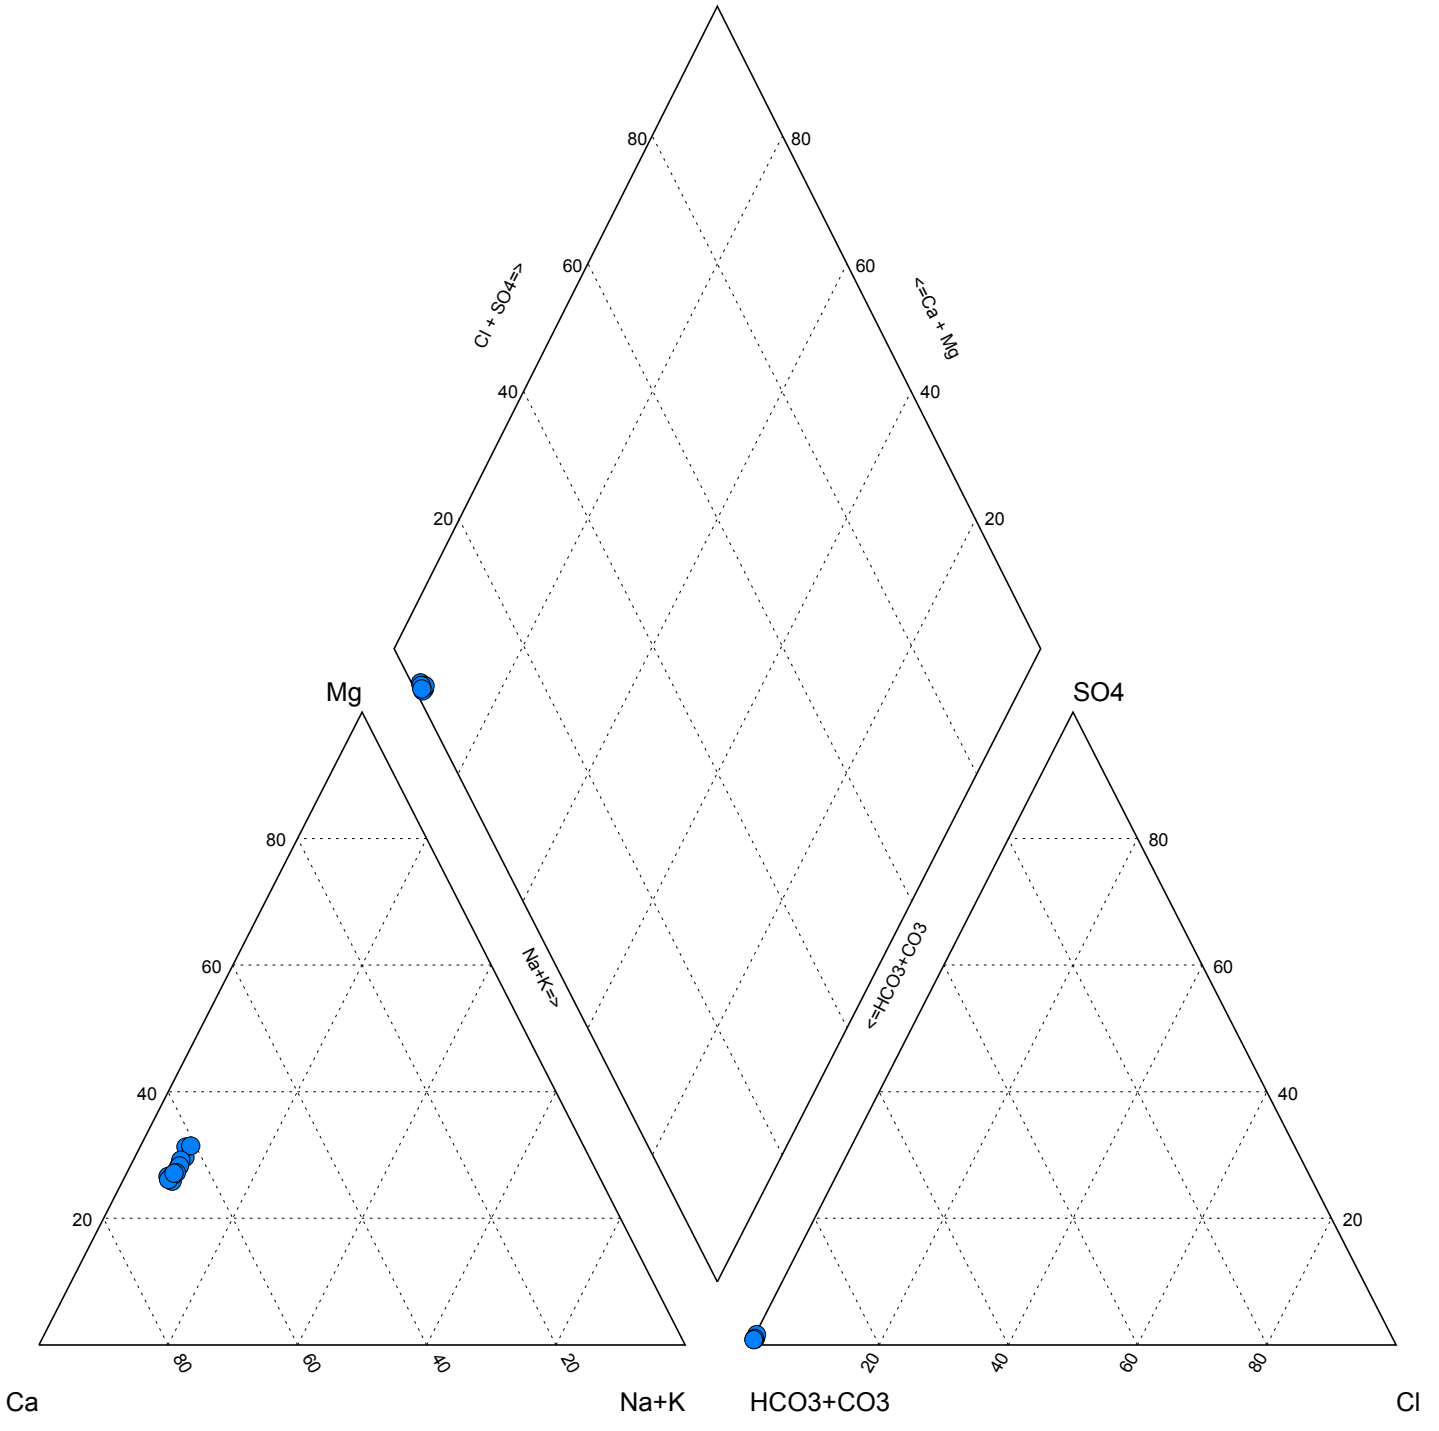
File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca



Notes:
1. The data set includes all results for individual samples for the years 2004-2008.
2. The axes of the Piper Plot indicate percentage of total milli-equivalents of ions.

Appendix 9.2E
Piper Plot of Well SRK2

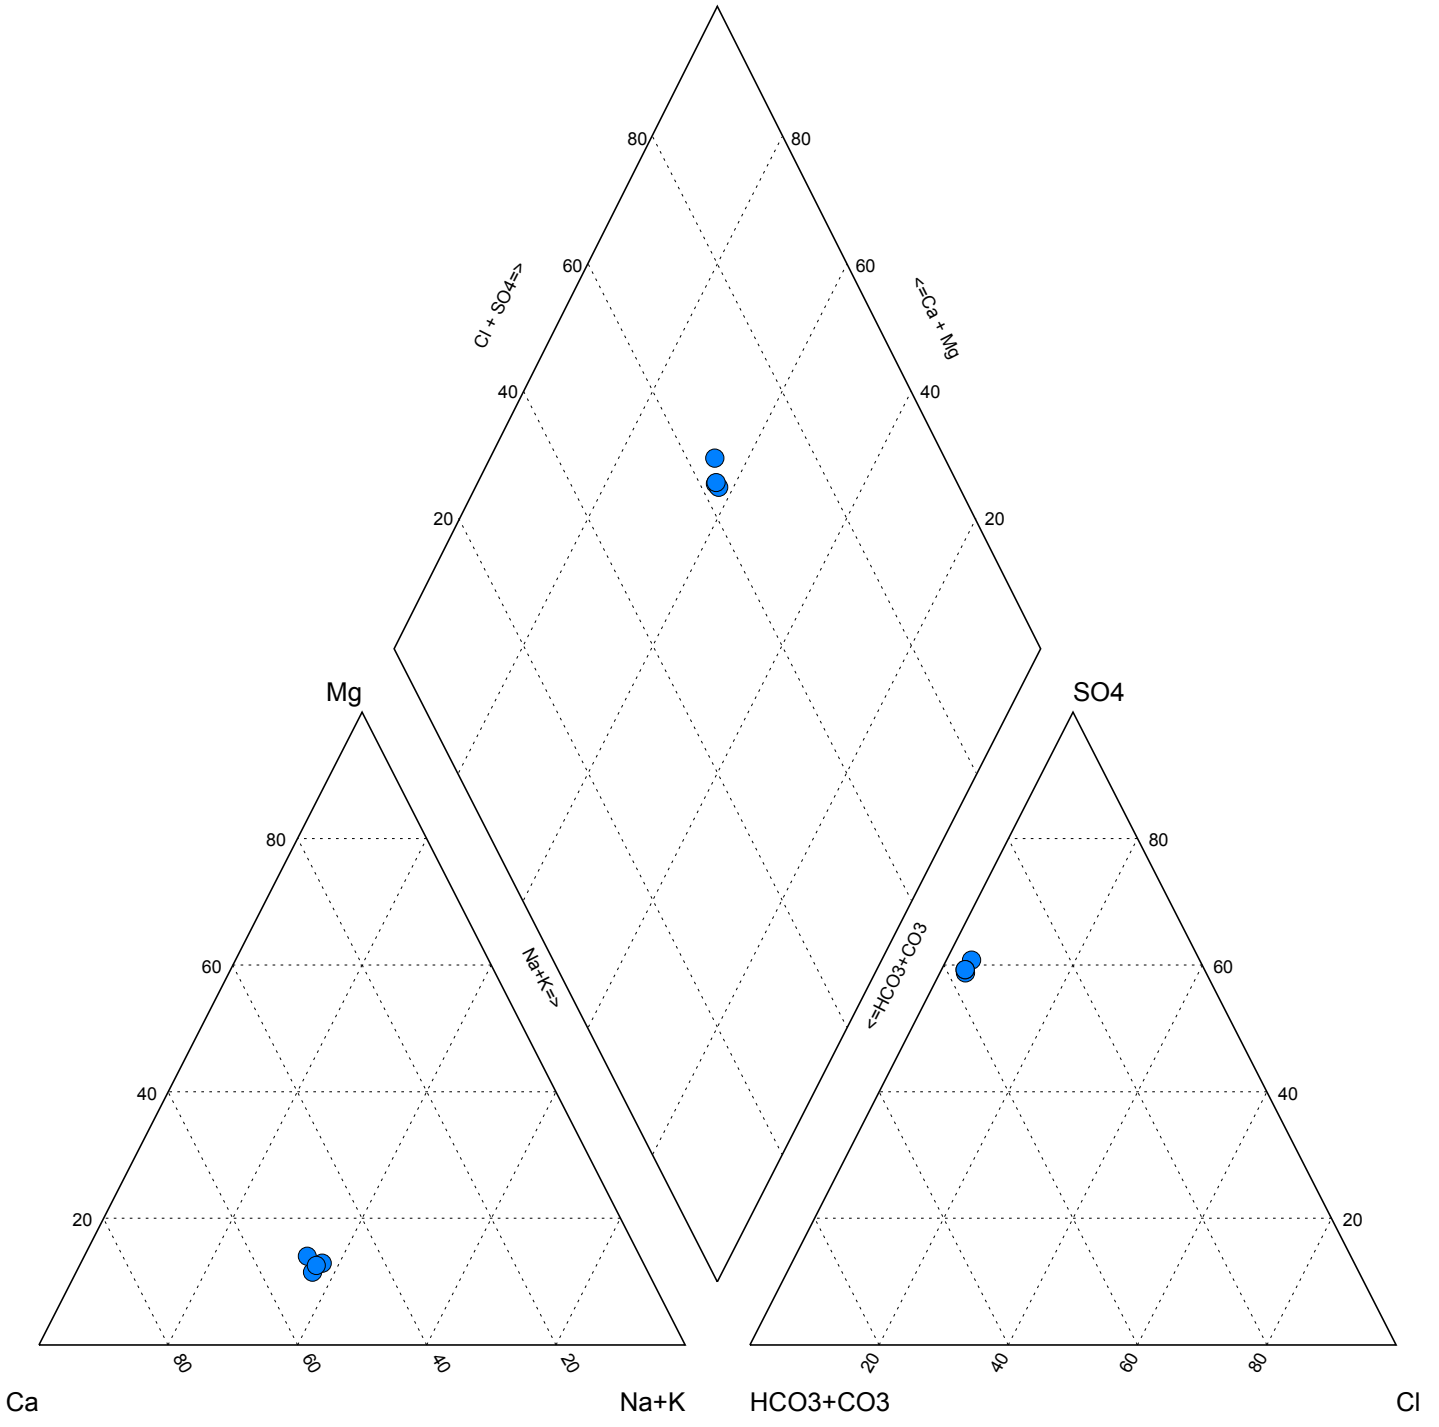
File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca



Notes:
1. The data set includes all results for individual samples for the years 2004-2008.
2. The axes of the Piper Plot indicate percentage of total milli-equivalents of ions.

Appendix 9.2E
Piper Plot of Well SRK3

File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca

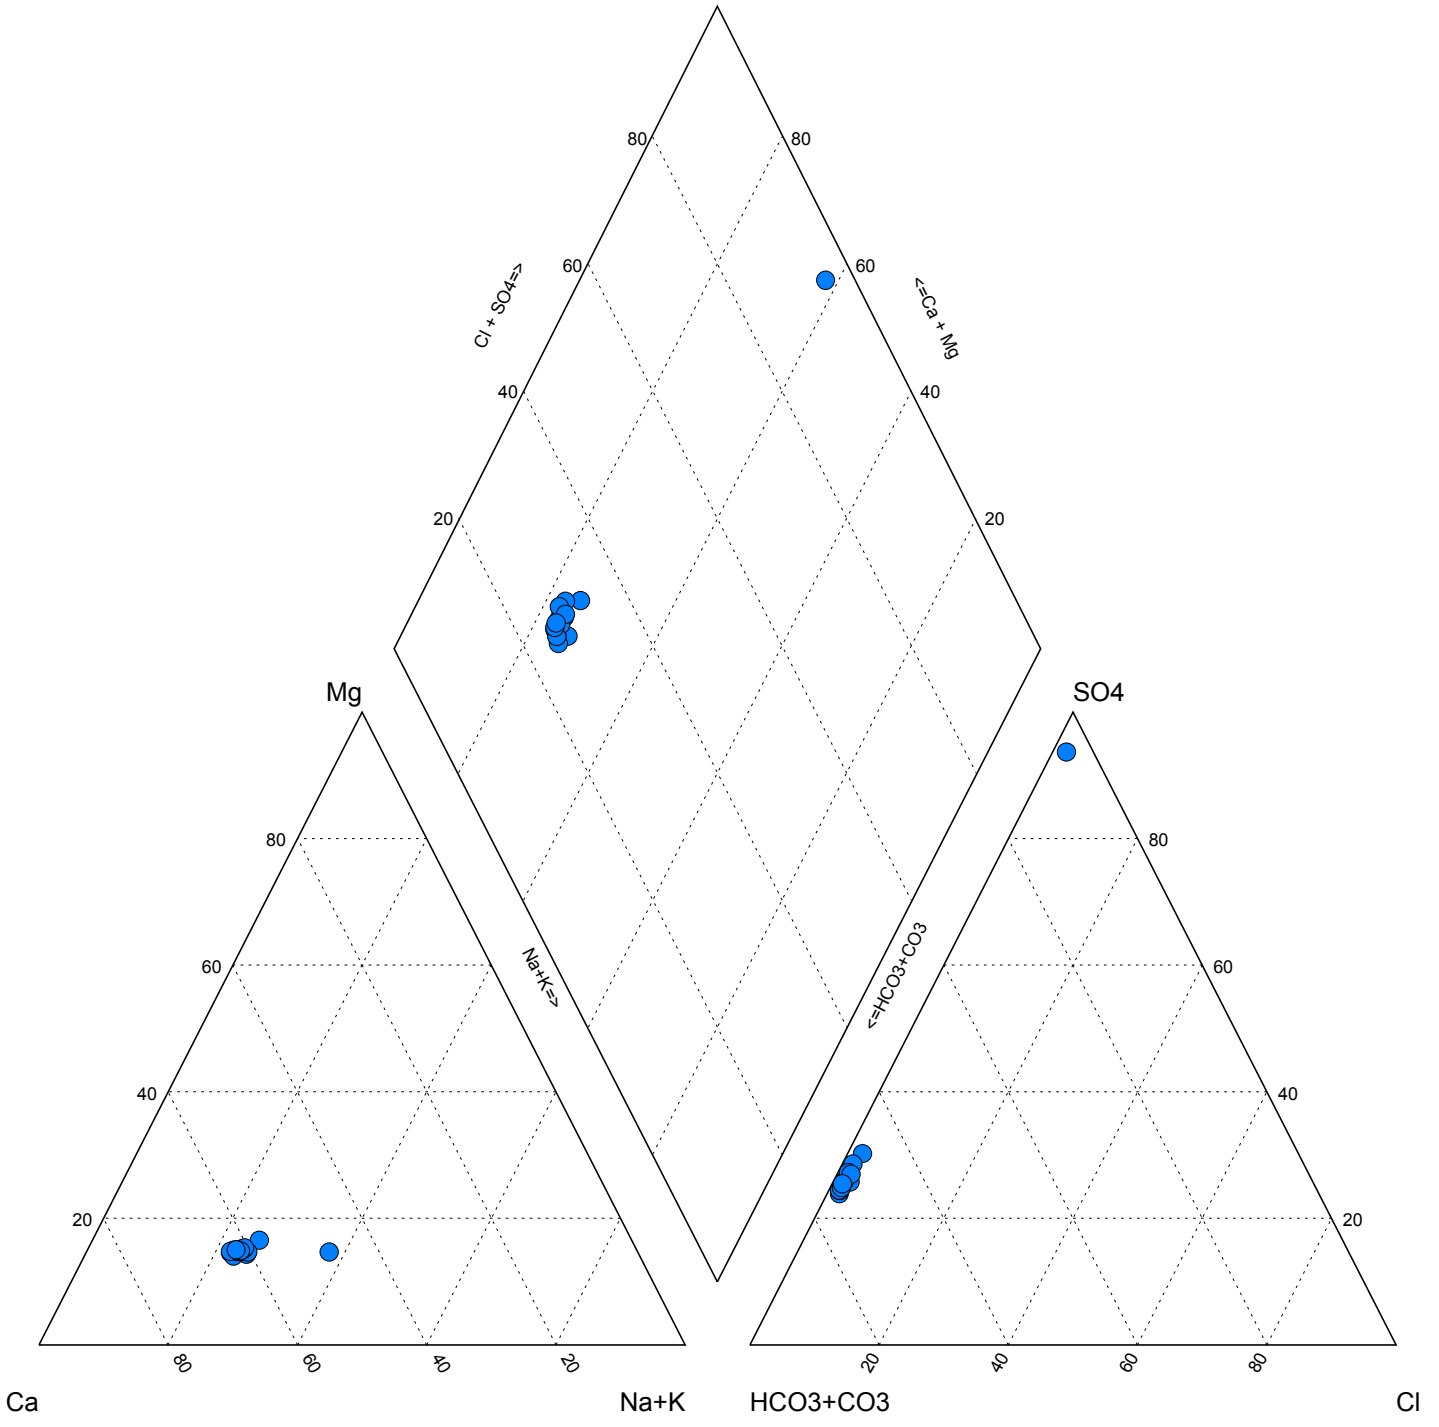


Notes:
1. The data set includes all results for individual samples for the years 2004-2008.
2. The axes of the Piper Plot indicate percentage of total milli-equivalents of ions.

THE pebble PARTNERSHIP

Appendix 9.2E
Piper Plot of Well SRK5D

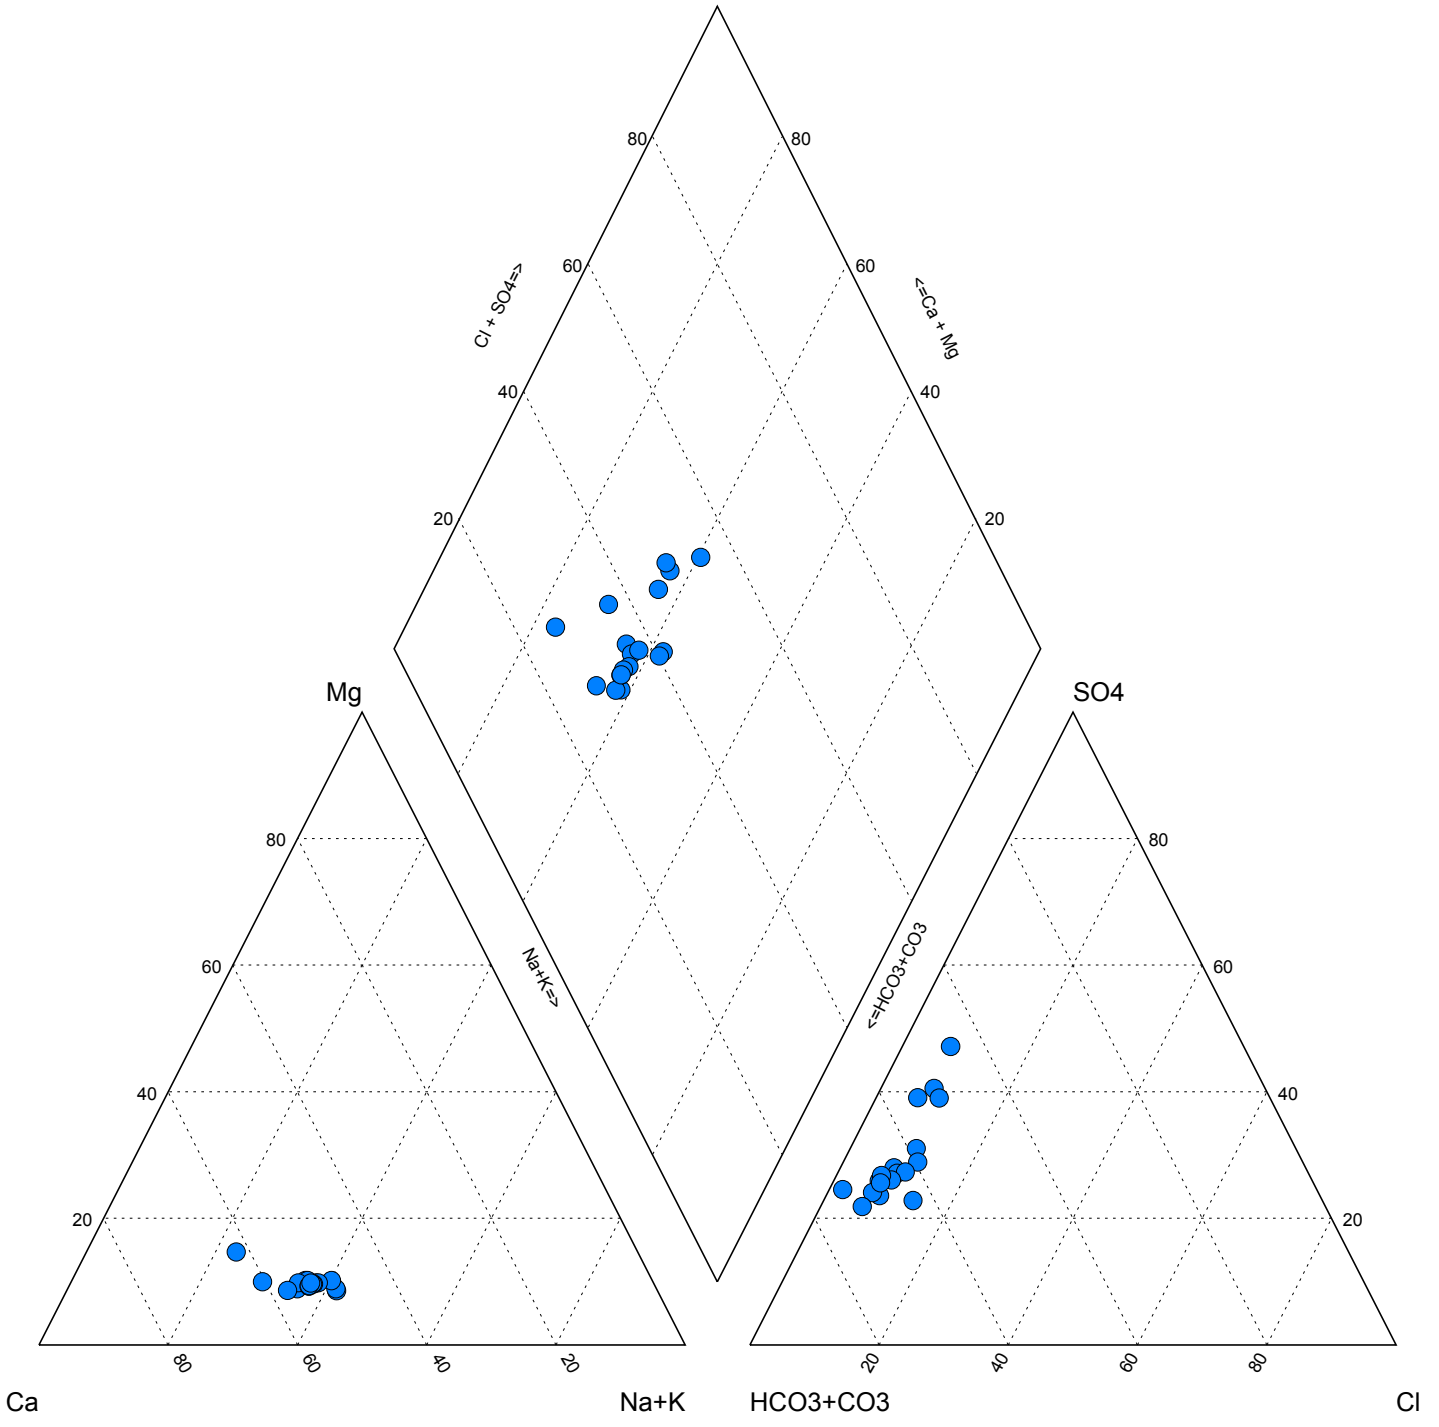
File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca



Notes:
1. The data set includes all results for individual samples for the years 2004-2008.
2. The axes of the Piper Plot indicate percentage of total milli-equivalents of ions.

Appendix 9.2E
Piper Plot of Well SRK5M

File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca



Notes:
1. The data set includes all results for individual samples for the years 2004-2008.
2. The axes of the Piper Plot indicate percentage of total milli-equivalents of ions.

Appendix 9.2E
Piper Plot of Well SRK5S

File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca

APPENDIX 9.2F

Stiff Diagrams of Major Ions in Groundwater at Individual Monitoring Well Locations, Mine Study Area 2004-2008

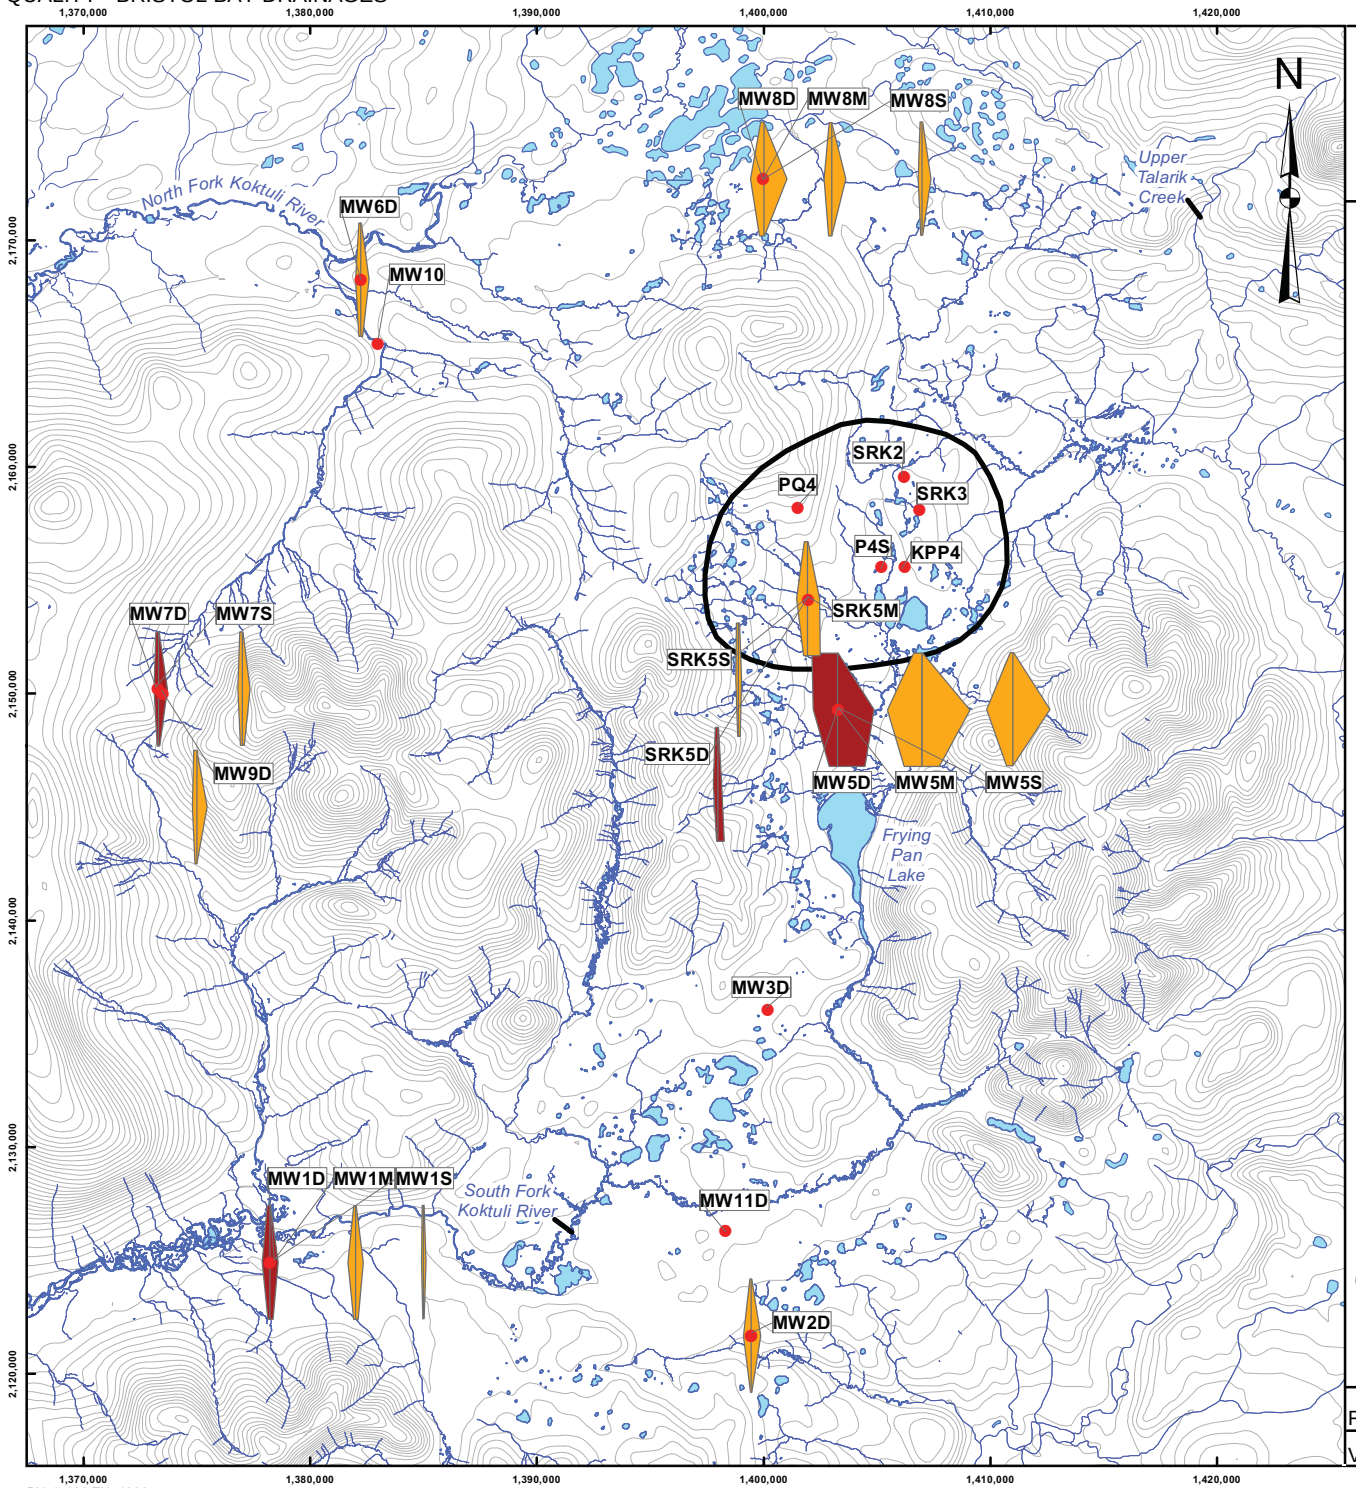
APPENDIX 9.2F
STIFF DIAGRAMS OF MAJOR IONS IN GROUNDWATER AT INDIVIDUAL MONITORING WELL LOCATIONS, MINE STUDY AREA (2004-2008)

Appendix 9.2F Stiff Diagrams of Major Ions in Groundwater at Individual Monitoring Well Locations, Mine Study Area (2004-2008)

Table of Contents

Stiff Diagrams:

- September, 2004 1
- October, 2004 2
- March, 2005 3
- May, 2005 4
- August, 2005 5
- November, 2005 6
- March, 2006 7
- May, 2006 8
- August, 2006 9
- November, 2006 10
- March, 2007 11
- May, 2007 12
- August, 2007 13
- November, 2007 14
- March, 2008 15
- May, 2008 16
- August, 2008 17
- October, 2008 18



THE pebble PARTNERSHIP

Appendix 9.2F

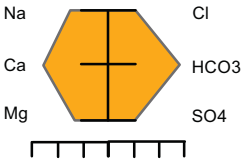
Stiff Diagrams of Major Ions in Groundwater at Individual Monitoring Well Locations in September, 2004

Legend

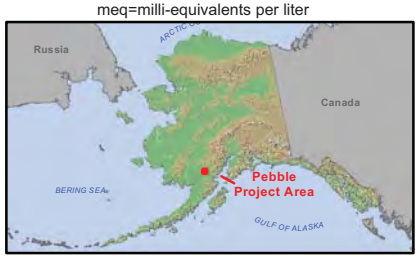
- Monitoring Well
- September 2004 Groundwater - Overburden
- September 2004 Groundwater - Bedrock
- General Deposit Location
- Lakes
- Rivers
- 50 ft Contour Interval

Notes:
1. MW7(S/D): example of monitoring well station label
2. The S, M and D suffix in the station label indicates the relative depth of the installation.
S: shallow
M: medium or intermediate
D: deep.

Stiff Diagram



meq=milli-equivalents per liter



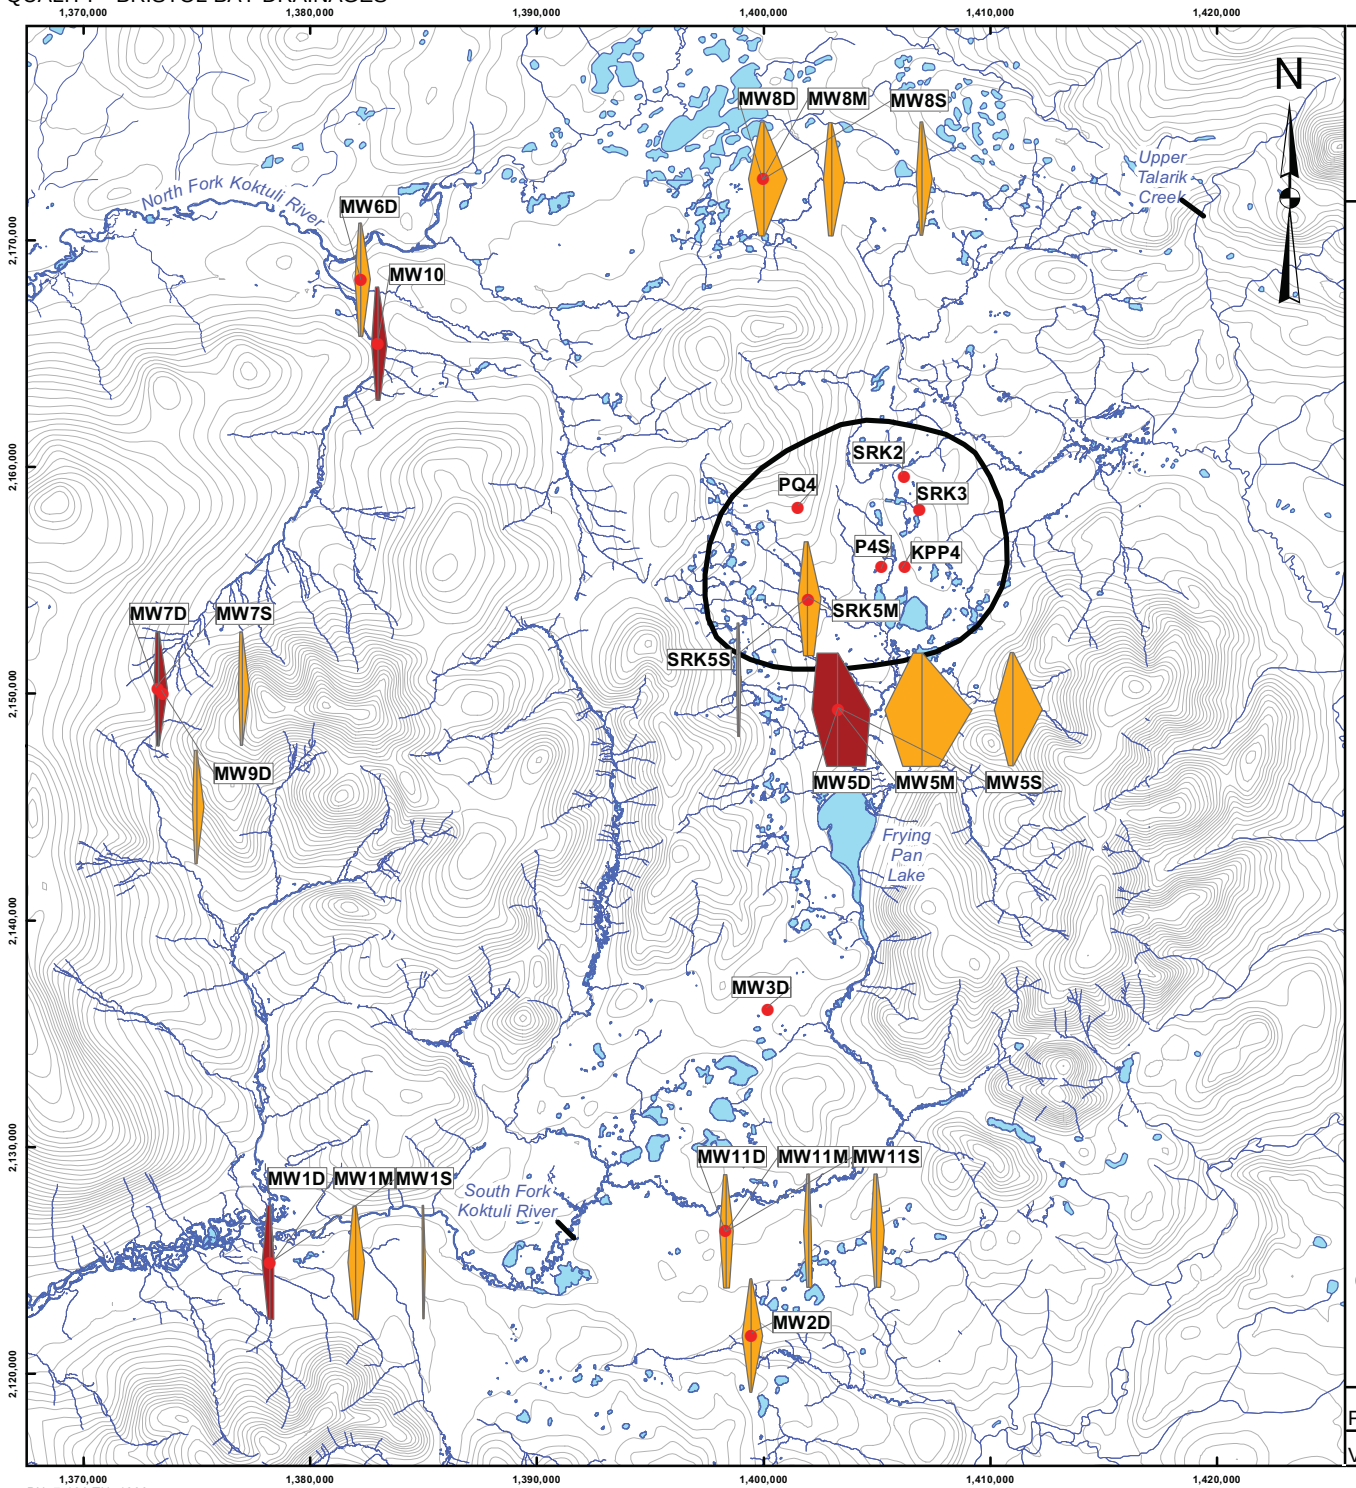
Feet
0 4,600 9,200 13,800 18,400

Meters
0 1,000 2,000 3,000 4,000

Scale 1:101,617

Alaska State Plane Zone 5 (units feet)
1983 North American Datum

Project No: 7126	Date: July 13, 2011
Version: 1	Author: SWS-BL



THE pebble PARTNERSHIP

Appendix 9.2F

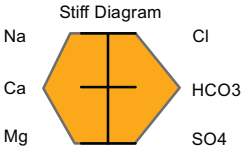
Stiff Diagrams of Major Ions in Groundwater at Individual Monitoring Well Locations in October, 2004

Legend

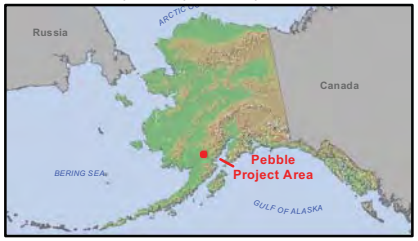
- October 2004 Groundwater - Bedrock
- General Deposit Location
- Lakes
- Rivers
- 50 ft Contour Interval

Notes:
1. MW7(S/D): example of monitoring well station label
2. The S, M and D suffix in the station label indicates the relative depth of the installation.
S: shallow
M: medium or intermediate
D: deep.

Stiff Diagram



meq=milli-equivalents per liter



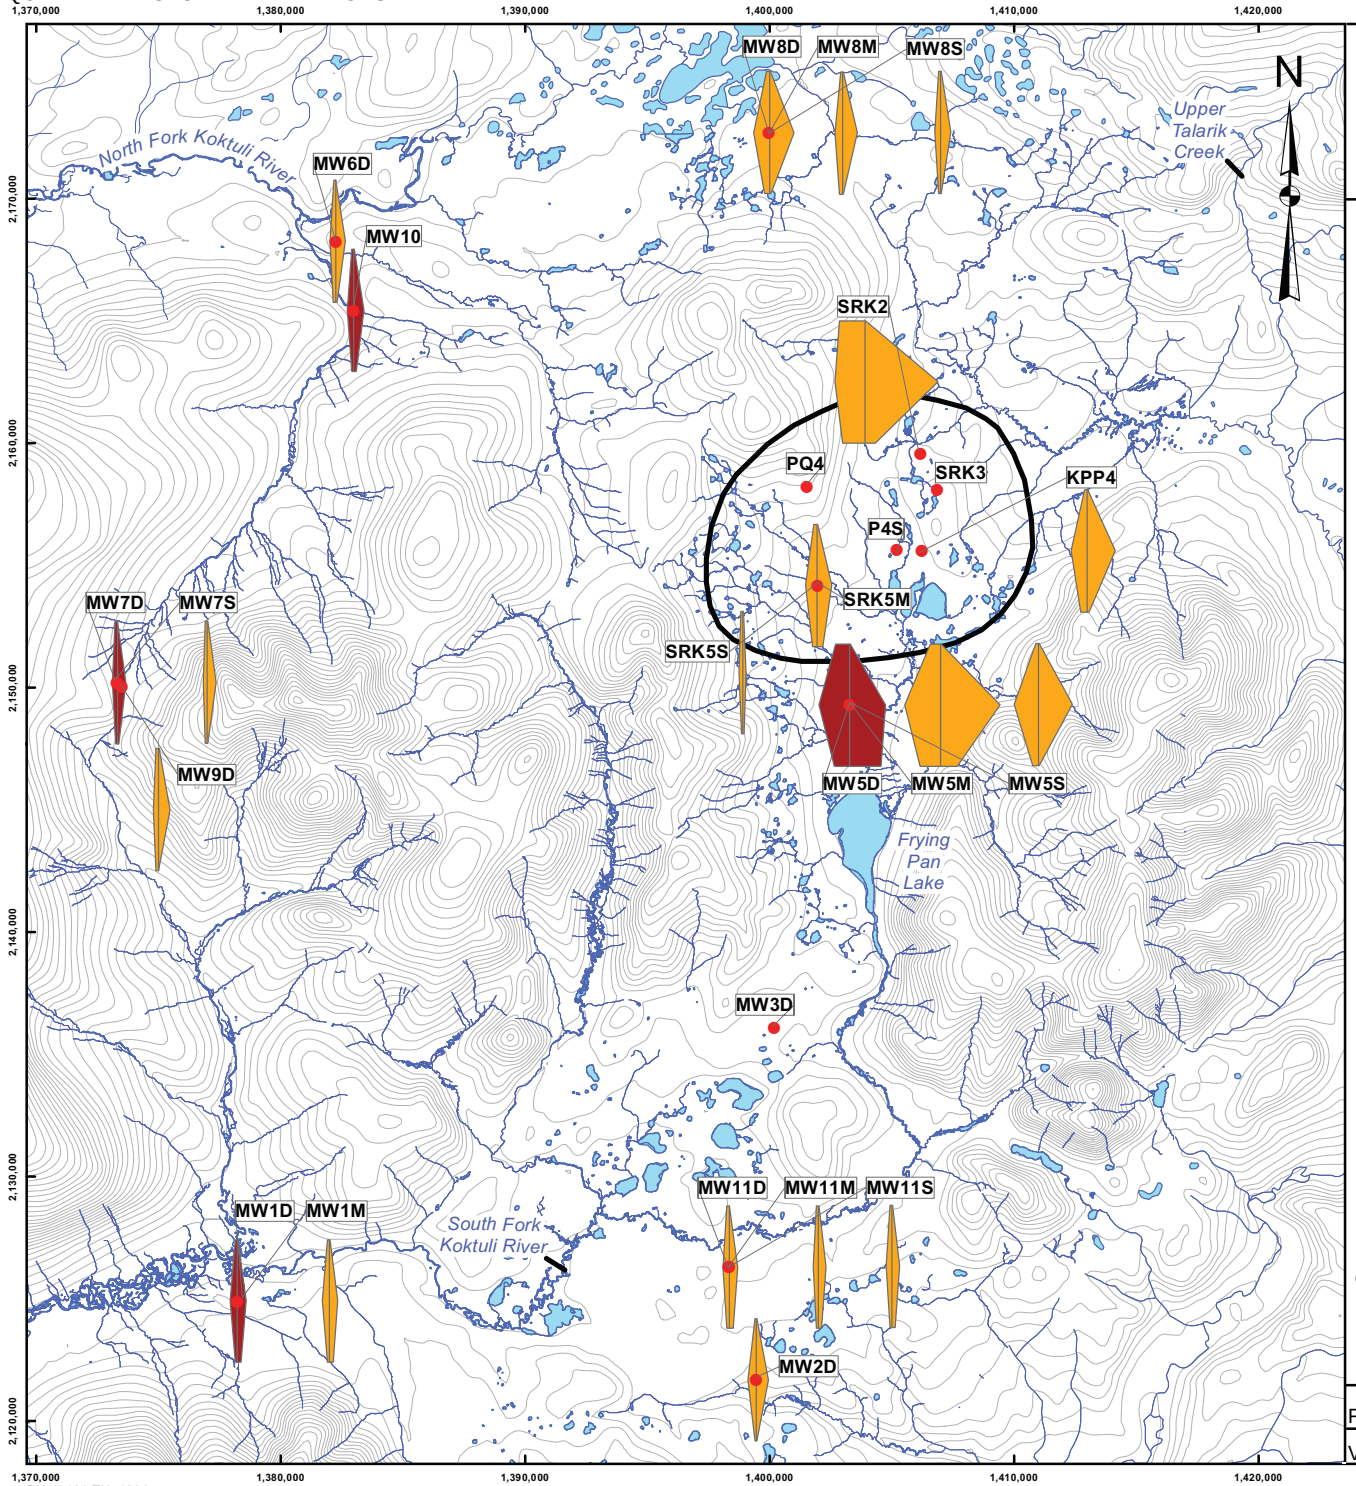
Feet
0 4,600 9,200 13,800 18,400

Meters
0 1,100 2,200 3,300 4,400

Scale 1:101,617

Alaska State Plane Zone 5 (units feet)
1983 North American Datum

Project No: 7126	Date: July 13, 2011
Version: 1	Author: SWS-BL



Appendix 9.2F

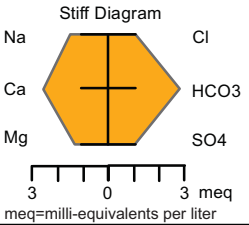
Stiff Diagrams of Major Ions in Groundwater at Individual Monitoring Well Locations in March, 2005

Legend

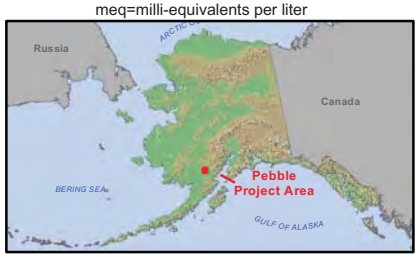
- Monitoring Well
- March 2005 Groundwater - Overburden
- March 2005 Groundwater - Bedrock
- General Deposit Location
- Lakes
- Rivers
- 50 ft Contour Interval

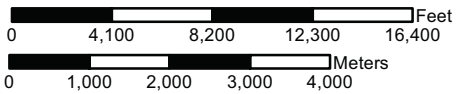
Notes:

1. MW7(S/D): example of monitoring well station label
2. The S, M and D suffix in the station label indicates the relative depth of the installation.
   S: shallow
   M: medium or intermediate
   D: deep.



meq=milli-equivalents per liter

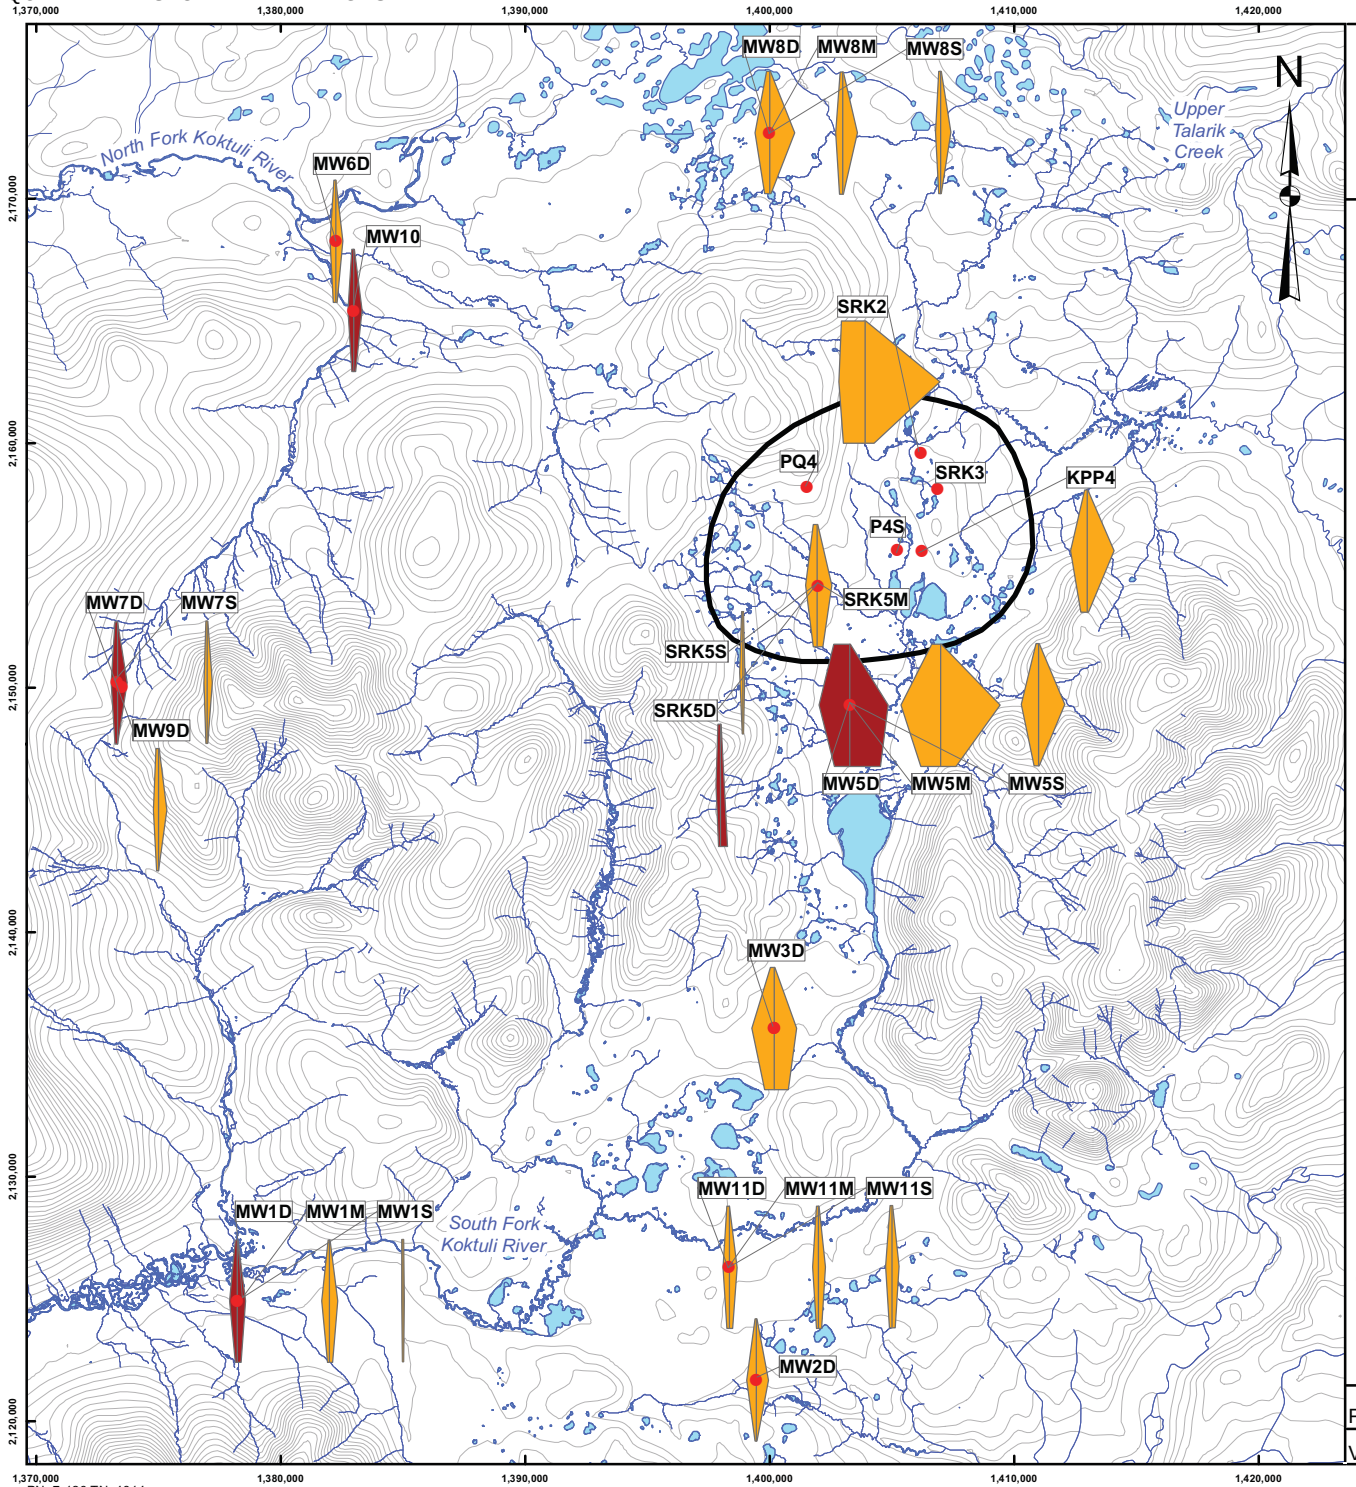




Scale 1:94,234

Alaska State Plane Zone 5 (units feet)
1983 North American Datum

Project No: 7126	Date: July 13, 2011
Version: 1	Author: SWS-BL



THE pebble PARTNERSHIP

Appendix 9.2F

Stiff Diagrams of Major Ions in Groundwater at Individual Monitoring Well Locations in May, 2005

Legend

- Monitoring Well
- May 2005 Groundwater - Bedrock
- May 2005 Groundwater - Overburden
- General Deposit Location
- Lakes
- Rivers
- 50 ft Contour Interval

Notes:
1. MW7(S/D): example of monitoring well station label
2. The S, M and D suffix in the station label indicates the relative depth of the installation.
S: shallow
M: medium or intermediate
D: deep.

Stiff Diagram

THE pebble PARTNERSHIP

Appendix 9.2F

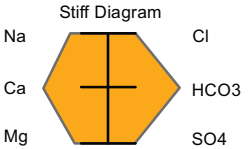
Stiff Diagrams of Major Ions in Groundwater at Individual Monitoring Well Locations in August, 2005

Legend

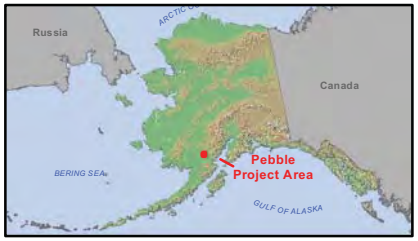
- Monitoring Well
- August 2005 groundwater - Overburden
- August 2005 groundwater - Bedrock
- General Deposit Location
- Lakes
- Rivers
- 50 ft Contour Interval

Notes:
1. MW7(S/D): example of monitoring well station label
2. The S, M and D suffix in the station label indicates the relative depth of the installation.
S: shallow
M: medium or intermediate
D: deep.

Stiff Diagram



meq=milli-equivalents per liter



Feet
0 4,000 8,000 12,000 16,000

Meters
0 1,000 2,000 3,000 4,000

Scale 1:94,234

Alaska State Plane Zone 5 (units feet)
1983 North American Datum

Project No: 7126	Date: July 13, 2011

APPENDIX 9.2H

Correlation Plots for Parameter Pairs with r>0.8 for Groundwater Wells, Mine Study Area 2004-2008

APPENDIX 9.2H
CORRELATION PLOTS FOR PARAMETER PAIRS WITH r>0.8 FOR GROUNDWATER WELLS, MINE STUDY AREA (2004-2008)

Appendix 9.2H - Correlation Plots for Parameter Pairs with r>0.8 for Groundwater Wells, Mine Study Area (2004-2008)

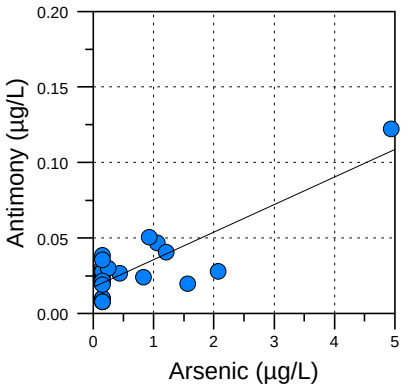
Table of Contents

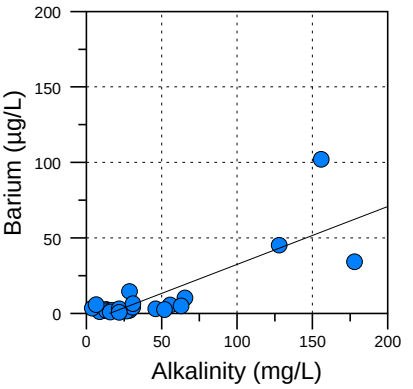
Correlation Plots for Parameter Pairs with r>0.8 for Groundwater Wells in the Overburden 1

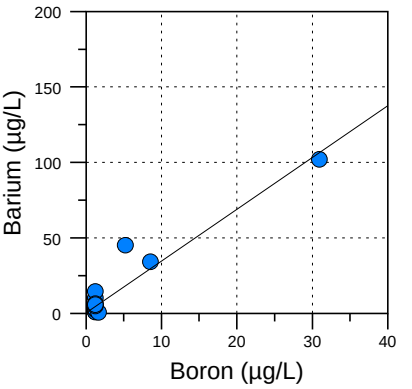
Correlation Plots for Parameter Pairs with r>0.8 for Groundwater Wells in Bedrock 7

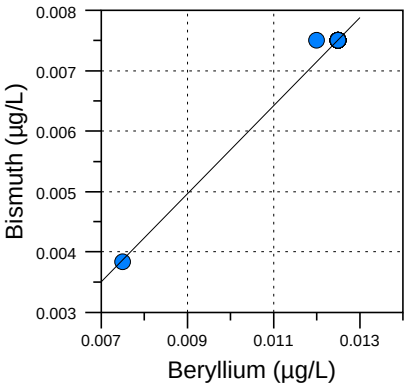
Table of correlation Coefficients in Overburden Wells 11

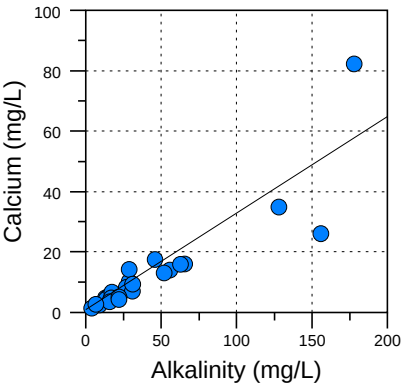
Table of correlation Coefficients in Bedrock Wells 12

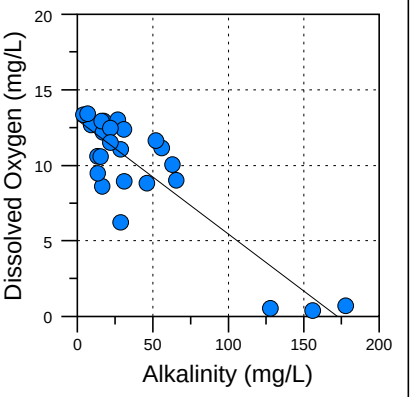


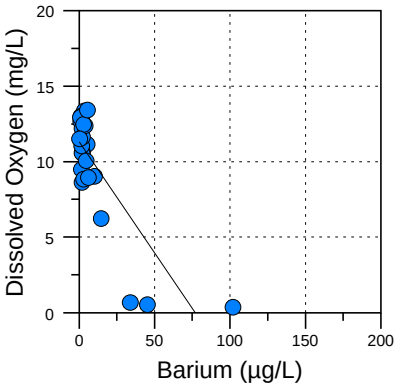


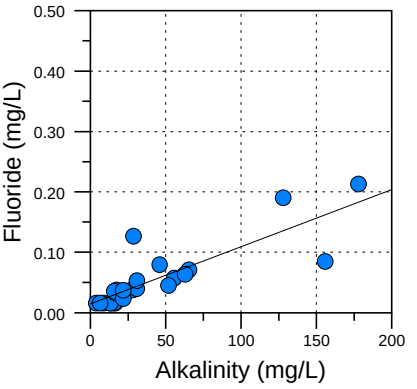


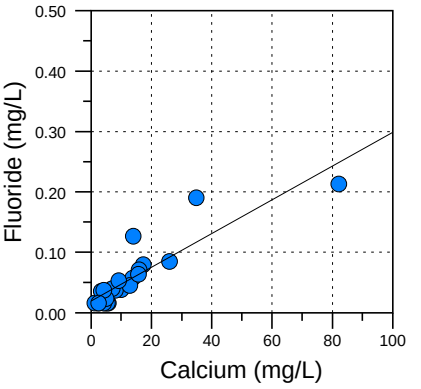












Legend

- Overburden
- Correlation Line

Notes:
1. Data plotted are medians of concentrations for years 2004-2008.
2. r represents the linear correlation coefficient between pairs of parameters. A higher value of r indicates stronger correlation between parameters. Parameter pairs with r>0.8 were plotted because this relatively high value indicates that the parameter concentrations may be related to one another. The plot is used to evaluate actual correlation.
3. mg/L = milligrams per liter
ug/L = micrograms per liter
uS/L = microsiemens per liter

THE pebble PARTNERSHIP

Appendix 9.2H
Correlation Plots for Parameter Pairs with r>0.8 for Groundwater Wells in the Overburden

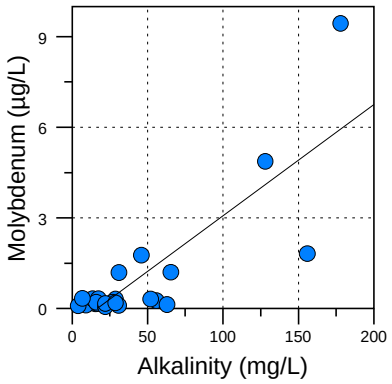
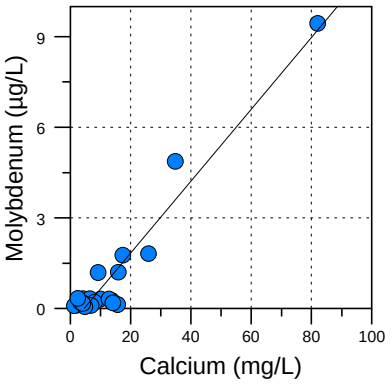
2. r represents the linear correlation coefficient between pairs of parameters. A higher value of r indicates stronger correlation between parameters. Parameter pairs with r>0.8 were plotted because this relatively high value indicates that the parameter concentrations may be related to one another. The plot is used to evaluate actual correlation.
3. mg/L = milligrams per liter
ug/L = micrograms per liter
uS/L = microsiemens per liter

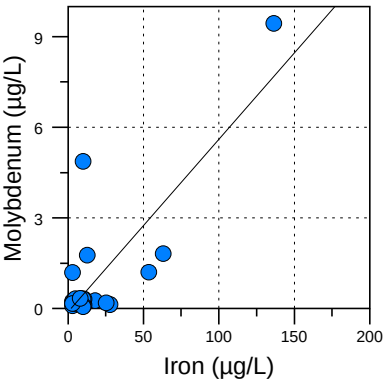
THE pebble PARTNERSHIP

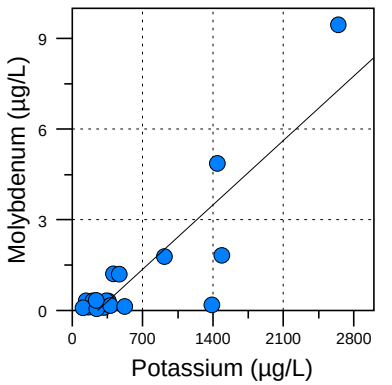
Appendix 9.2H
Correlation Plots for Parameter Pairs with r>0.8 for Groundwater Wells in the Overburden

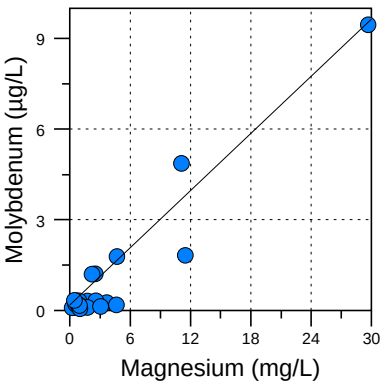
File: 7126	Date: Jul 07, 2011
Version: 1	Author: SWS-ca

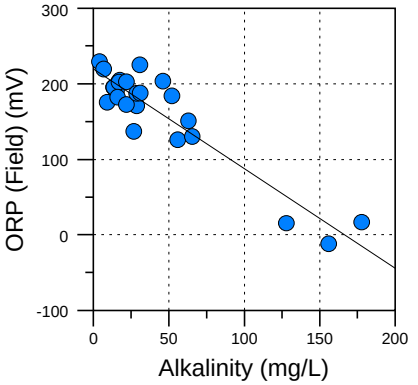


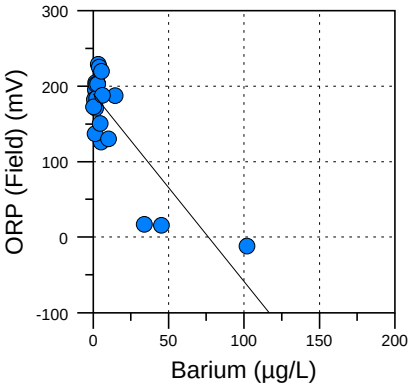


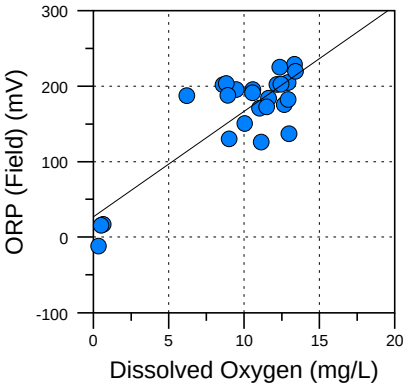


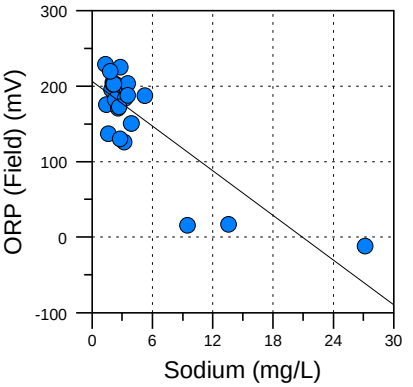












Legend

- Overburden
- Correlation Line

Notes:
1. Data plotted are medians of concentrations for years 2004-2008.
2. r represents the linear correlation coefficient between pairs of parameters. A higher value of r indicates stronger correlation between parameters. Parameter pairs with r>0.8 were plotted because this relatively high value indicates that the parameter concentrations may be related to one another. The plot is used to evaluate actual correlation.

APPENDIX 9.2I

Temporal Trend Analysis of Individual Sampling Events at Individual Groundwater Monitoring Well Locations, Mine Study Area 2004-2008

APPENDIX 9.2I
TEMPORAL TREND ANALYSIS OF INDIVIDUAL SAMPLING EVENTS AT INDIVIDUAL GROUNDWATER MONITORING WELL LOCATIONS, MINE STUDY AREA (2004-2008)

Appendix 9.2I Temporal Trend Analysis of Individual Sampling Events at Individual Groundwater Monitoring Well Locations, Mine Study Area (2004-2008)

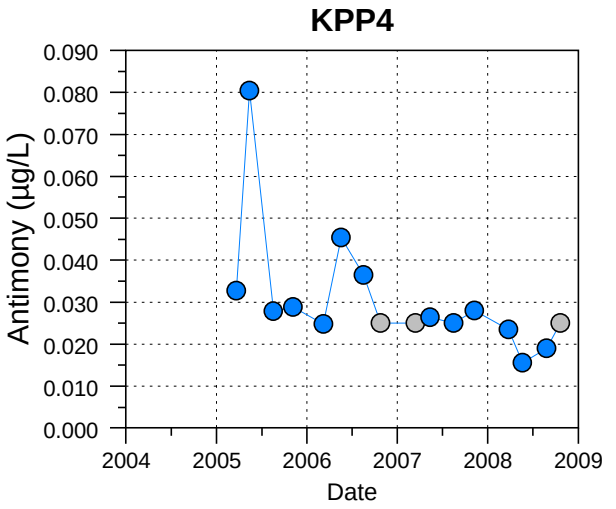
Table of Contents

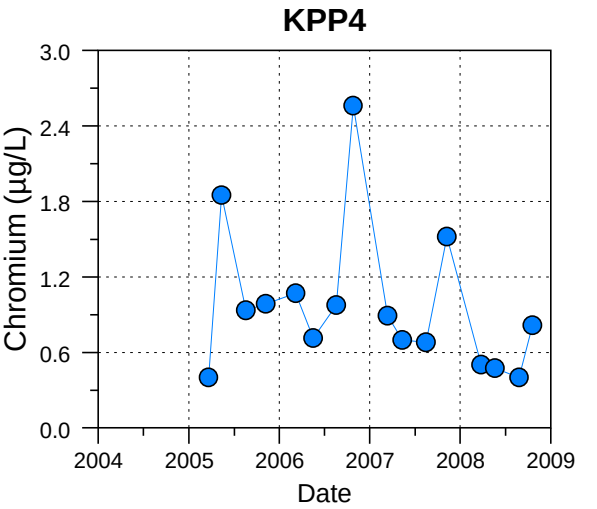
Parameters with Decreasing Trend Over Time for the Following Groundwater Monitoring Well Locations:

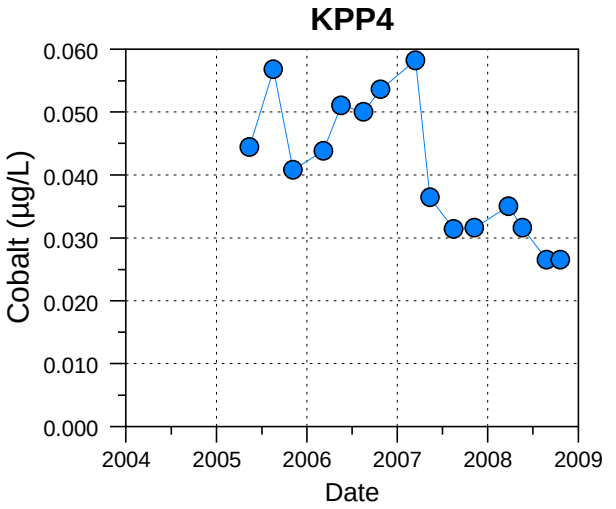
KPP4, MW10 1
MW10, MW11D 2
MW11D, MW11M 3
MW11M, MW11S 4
MW11S, MW11SS 5
MW11SS 6
MW11SS, MW12D 7
MW12D 8
MW12S 9
MW12S, MW13D 10
MW13D 11
MW13D 12
MW13S, MW14D 13
MW14D, MW14S 14
MW14S, MW1D 15
MW1D, MW1M 16
MW1M, MW1S, MW2D 17
MW2D, MW5D 18
MW5D, MW5M 19
MW5M, MW5S 20
MW5S 21
MW6D 22
MW7D 23
MW7D, MW7S 24
MW7S, MW8D 25
MW8D, MW8M 26
MW8M, MW8S 27
MW9D, P0637D, P0637M 28
P0637M, P0638M 29
P0638M, P4S 30
PQ4 31
SRK2 32
SRK2, SRK3 33
SRK3, SRK5D, SRK5M 34
SRK5S 35

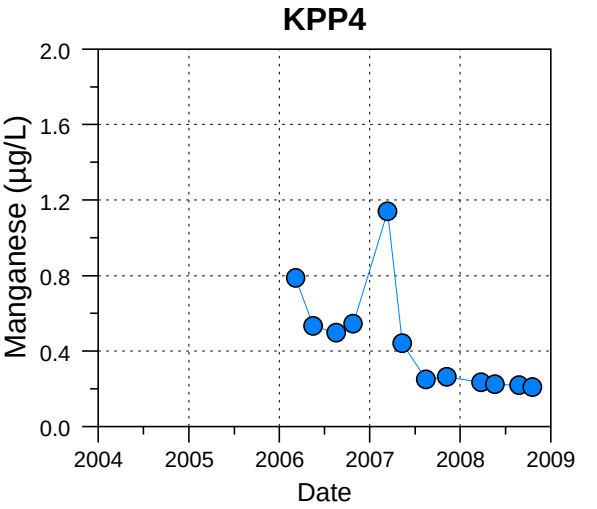
Parameters with Increasing Trend Over Time for the Following Groundwater Monitoring Well Locations:

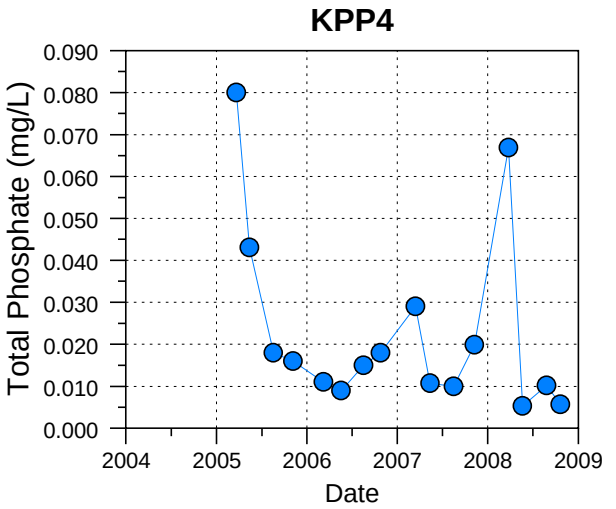
KPP4, MW11D, MW11S 36
MW11S, MW12D, MW12S 37
MW12S, MW13D, MW14D 38
MW14D 39
MW14D, MW14S, MW1M, MW1S, MW2D 40
MW2D, MW3D 41
MW5D 42
MW5D, MW5M 43
MW5M, MW5S, MW7D, MW7S, MW8D 44
MW8D, MW8M, MW8S, MW9D 45
MW9D, P0637D, P0637M 46
P0637S, P0638M, P4S, PQ4, ... 47
PQ4, SRK2, SRK3 48
SRK3, SRK5D, SRK5S 49

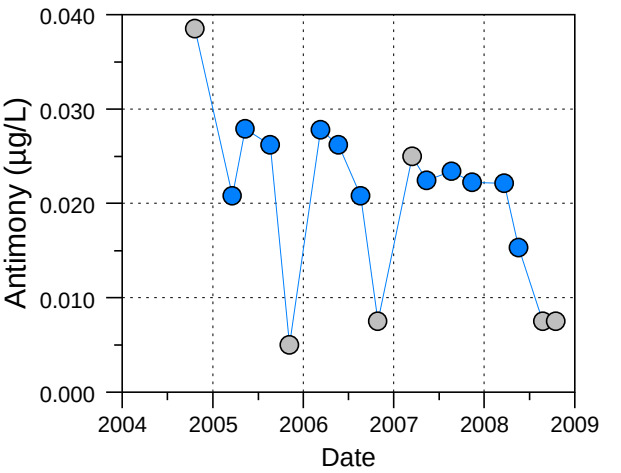












Legend

Analytical Result

Not Detected

Notes:
1. MW7: example of a monitoring well station label
2. The S, M and D suffix in the station label indicates the relative depth of the installation.
S: shallow
M: medium or intermediate
D: deep.
3. mg/L= milligrams per liter
ug/L = micrograms per liter
uS/L = microsiemens per liter

9.3. Surface Water—Transportation Corridor

9.3.1. Introduction

This section presents the findings of the 2004 and 2005 surface water quality study within the transportation-corridor, Bristol Bay drainages for the Pebble Project. This study was conducted by Bristol Environmental & Engineering Services Corporation (BEESC).

Water samples were collected and analyzed for major ions and alkalinity, nutrients, total and dissolved trace elements, and cyanide. Select samples were also analyzed for organic compounds.

9.3.2. Study Objectives

The objectives of the surface water quality study include the following:

- Collect baseline data to provide scientific documentation of the concentrations and variability of naturally occurring constituents in the surface water of freshwater streams within the transportation-corridor, Bristol Bay drainages study area.
- Provide a database of water chemistry for the transportation-corridor, Bristol Bay drainages study area.

9.3.3. Study Area

The transportation-corridor, Bristol Bay drainages study area consisted of a 2,000-foot (600-meter) wide survey corridor encompassing a representative road alignment between the Newhalen River and the hydrologic divide between the Bristol Bay and Cook Inlet drainages (Figure 9.3-1).

9.3.4. Scope of Work

Field studies were conducted according to the approach described in Chapter 6 of the consolidated study program for Pebble Project (a copy of which is provided in Appendix E of this environmental baseline document [EBD]). In 2004 and 2005, up to 16 water quality sampling stations were established on representative stream crossings along the portion of the transportation corridor within the Bristol Bay drainage (Figure 9.3-1). The 16 water quality sample station locations are listed in Table 9.3-1, along with land ownership and months sampled. Initially 11 stations were established and a few more added during 2004 for better spatial coverage along the transportation corridor. In 2004 up to 15 stations were sampled monthly from July to October 2004, and during the winter months of February and March 2005. Seven stations were chosen for sampling in May 2005 that would continue to provide the program with spatially representative stream locations along the transportation corridor. Two additional stations were added in July 2005, resulting in nine stations that were sampled monthly from May to October 2005.

9.3.5. Methods

9.3.5.1. Site Selection

Freshwater streams along the transportation corridor that are listed in the *Catalog of Waters Important for Spawning, Rearing, or Migration of Anadromous Fishes – Southwestern Region* (Johnson and Weiss,

2006) were selected for sampling in coordination with locations chosen for fish studies and with monitoring stations used for the hydrology study. Station GS-4B was added in September 2004 after HDR Alaska, Inc., identified it as a trout-bearing stream during the course of fish studies conducted for the Pebble Project.

9.3.5.2. Sampling Procedures

Field sampling was conducted in accordance with Chapter 6 of the consolidated study program for Pebble Project (Appendix E) and the field sampling plan (Appendix F). Quality Assurance/Quality Control (QA/QC) protocols followed procedures outlined in Quality Assurance Project Plan in Appendix G. The consultant coordinated closely with the water quality sampling consultants for the mine site to ensure that the procedures followed in the two study areas were consistent. Photographs of field personnel conducting surface water sampling are included in the photographs sections attached to this chapter.

9.3.5.3. Data Analysis

Analytical and field parameter data for 2004 and 2005 sampling events are summarized in tables and in graphs included in the appendices to this chapter. Analytical, select field measurement, QA/QC, and outliers analysis data for all of the surface water samples are presented in Appendix 9.3A. Field parameter data and hydrographs for individual surface water sampling locations are presented graphically in Appendix 9.3B. Graphs of total and dissolved major ions for the surface water samples at individual sampling locations are presented in Appendix 9.3C. Piper diagrams of the major ion composition of the eastern sample stations and the major ion composition of the western sample stations are presented in Appendix 9.3D. Select trace elements at individual sampling locations are presented graphically in Appendix 9.3E. Analytical results for all organic constituent samples are presented in Appendix 9.3F. Box and whisker plots of individual parameter concentrations for the eastern sample group compared to the western sample group are presented in Appendix 9.3G.

Only primary sample data were used for analyses in this EBD. Duplicate and triplicate sample data were only used for evaluation of precision. Only sample locations from which analytical data were collected were included in the evaluation.

The data were treated as two separate datasets based on geology, the western group of stations and the eastern group of stations as described in Section 9.3.6. General statistics were compiled for each dataset, including the following:

- Minimum and maximum detected concentrations.
- Sample-specific minimum and maximum method detection limits (MDLs) and method reporting limits (MRLs).
- Number of results detected.
- Number of samples analyzed.
- Frequency of detection.
- Arithmetic mean and median concentrations.
- Standard deviations and coefficients of variation.

Non-detect results were included for statistical summaries as one-half the MDL, and non-detect results that were qualified as estimated were included as one-half the MRL. For all other statistical analyses, only detected concentrations were included to avoid skewing the datasets based on multiple non-detect values. Statistical summary tables for the Eastern Sample Stations and the Western Sample Stations are provided in Tables 9.3-2 through 9.3-13.

Analytical data listed in Appendix 9.3A1 highlight values that are undetected, results that exceed the Alaska Department of Environmental Conservation (ADEC) water quality criteria, and results reported by the laboratory as being below the MRL, which is also referred to in the appendices as the practical quantitation limit (PQL). Only validated data were used in the summary tables and graphs. See Appendix A, Analytical Data QA/QC, of this EBD for a data quality assessment.

At the time of sample collection, the following field parameters were measured and recorded:

- Dissolved oxygen.
- pH.
- Specific conductivity.
- Turbidity.
- Water temperature.
- Oxidation Reduction Potential (ORP).
- Stream discharge (flow).

In addition, analysis for petroleum hydrocarbons (gasoline range organics, diesel range organics, and residual range organics), volatile organic compounds, semivolatile organic compounds, and pesticides were performed on three samples collected in October 2004. None of the compounds in these analytical suites were detected at concentrations above MRLs, so they were excluded from further evaluation. The analytical results are summarized in Appendix 9.3F.

9.3.6. Results and Discussion

This section discusses and summarizes the field parameters and qualified laboratory analytical results from surface water samples collected in July 2004 through October 2005 along the transportation-corridor, Bristol Bay drainages study area. For the purposes of this discussion, the surface water sample stations along the transportation corridor, Bristol Bay drainages study area have been divided into a western and eastern group on the basis of geology. The rationale for dividing the stations in this manner was the potential impact of geology on surface water chemistry. The western group of stations (GS-11A, GS-12A, GS-14A, GS-14B, GS-17A, GS-18A, GS-20, GS-20A, and NHRIV) are located within an area where the bedrock is typically overlain by Quaternary cover. The bedrock includes mafic to felsic Tertiary volcanic rocks, Tertiary and Cretaceous felsic intrusions, and Mesozoic sedimentary and volcanic rocks (Detterman and Reed, 1980). The eastern group of stations (GS-23, GS-3A, GS-4A, GS-4B, GS-6A, GS-7A, and GS-8A) are located within an area where bedrock is typically exposed at the surface and is dominated by large felsic Mesozoic intrusions. The western group includes all nine stations west of Knutson Bay, while the eastern group includes all seven stations east of Knutson Bay that are within the Bristol Bay drainages.

Appendix 9.3A contains the QA/QC evaluation control plots showing outliers at individual water sampling locations (Appendix 9.3A2), and the laboratory results summary (Appendix 9.3A1).

For most parameters, the relevant regulated water quality criteria are established by ADEC as chronic aquatic life criteria (CALC) for fresh water or as drinking water standards (DWS). Comparisons with the most stringent water quality criteria are provided for some parameters. Some CALC criteria are hardness dependent (cadmium, copper, chromium, lead, nickel and zinc); these criteria are preliminary estimates.

9.3.6.1. Field and Physical Parameters

Total Dissolved Solids

Analysis of water samples from the surface water stations indicated that dissolved solids concentrations were generally low throughout the study area. Total dissolved solids (TDS) for the western group of stations had a mean of 43 milligrams per liter (mg/L) and ranged from 10 to 126 mg/L, while the TDS for the eastern group had a mean of 26 mg/L and ranged from 1.55 to 110 mg/L (Appendix 9.3A1). All TDS results were well below the most stringent water quality maximum criterion (ADEC DWS of 500 mg/L). Low concentrations of dissolved solids such as these are representative of basins containing thin soils and rocks that are not easily dissolved or water that has had only brief contact time with more easily dissolved rocks.

pH

The western group of stations had field pH readings that ranged from 4.58 to 8.83, while the eastern group had field pH readings from 4.69 to 8.59 (Appendix 9.3B).

Dissolved Oxygen

Dissolved oxygen concentrations for the western group of stations had a mean of 13 mg/L and ranged from 9.13 to 19 mg/L, concentrations for the eastern stations also had a mean of13 mg/L and ranged from 9.57 to 18 mg/L (Appendix 9.3B). Dissolved oxygen concentrations varied seasonally; the highest concentrations for both groups of stations were measured in February (when they had a mean of 16 mg/L), and the lowest concentrations were measured in August (when they had a mean of 12 mg/L).

Water Temperature

No surface water samples were collected and no water temperatures were recorded during the months of November, December, or January. The coldest water temperatures recorded for both groups of stations were during the months of February and April, when stream temperatures had a mean of 1 degree Celsius (°C) and ranged from 0.08 to 3.31°C (Appendix 9.3B). The warmest water temperatures recorded were during the months of July and August, when stream temperatures had a mean of 13°C and ranged from 6.13°C to 22.70°C.

Specific Conductance

Field-specific conductance values ranged from 20 to 780 micromhos per centimeter (µmhos/cm) for the western group of stations, and from 10 to 210 µmhos/cm for the eastern group (Appendix 9.3B). Generally, specific conductance values for streams along the Bristol Bay study area vary inversely with discharge; sampling events with the highest discharge values are characterized by low specific conductance values relative to sampling events with the lowest discharge values. This may reflect a

higher relative contribution of groundwater with high specific conductance during periods of low stream discharge.

Total Suspended Solids

Values for total suspended solids ranged from 0.2 to 51.6 mg/L for the western group of stations and from 0.2 to 34.8 mg/L for the eastern group (Appendix 9.3A1).

ORP

The western group of stations had field ORP readings that ranged from -33.3 to 369 millivolts (mV), and the eastern group had field ORP readings from 72.5 to 364.1 mV (Appendix 9.3B).

Summary of Field and Physical Parameters

In summary, the western portion of the study area can be generalized as having higher TDS and specific conductance than the eastern portion of the study area, although TDS was well below the most stringent water quality maximum criterion. All other physical parameters measured appeared to be similar in all streams tested.

9.3.6.2. Major Ions

Major ions concentrations, in both total and dissolved analyses where applicable (Ca, Mg, Na, K), are shown graphically for individual sampling locations in Appendix 9.3C.

Calcium

Calcium is the dominant cation reported in water quality samples collected throughout the study area. Total calcium concentrations for the western group stations had a mean of 7.1 mg/L and ranged from 2.3 to 14 mg/L, while total calcium concentrations for the eastern group had a mean of 3.3mg/L and ranged from 1.0 to 9.2 mg/L. Dissolved calcium concentrations for the western group stations had a mean of 7.0 mg/L and ranged from 2.3 to 12.9 mg/L, while dissolved calcium for the eastern group had a mean of 3.3 mg/L and ranged from 1.0 to 9.8 mg/L (Appendix 9.3A1). No criterion exists for total or dissolved Calcium.

Magnesium

Total magnesium concentrations for the western group of stations had a mean of 0.879 mg/L and ranged from 0.181 to 1.34 mg/L, and total magnesium concentrations for the eastern group had a mean of 0.301 mg/L and ranged from 0.10 to 0.648 mg/L. Dissolved magnesium concentrations for the western group had a mean of 0.859 mg/L and ranged from 0.180 to 1.27 mg/L and dissolved magnesium concentrations for the eastern group had a mean of 0.274 mg/L and ranged from 0.097 to 0. 599 mg/L (Appendix 9.3A1). No criterion exists for total or dissolved Magnesium.

Sodium

Total sodium concentrations for the western group of stations had a mean of 2.0 mg/L and ranged from 1.0 to 4.1 mg/L, while total sodium concentrations for the eastern group had a mean of 1.2 mg/L and ranged from 0.77 to 2.7 mg/L. Dissolved sodium concentrations for the western group had a mean of 1.95 mg/L and ranged from 1.0 to 3.9 mg/L while dissolved sodium concentrations for the eastern group had a

mean of 1.2 mg/L and ranged from 0.62 to 2.4 mg/L (Appendix 9.3A1). No criterion exists for total or dissolved Sodium.

Potassium

Both the total and dissolved potassium concentrations were low at all the sites along the transportation corridor. Total potassium concentrations for the western group had a mean of 0.31 mg/L and ranged from 0.11 to 0.86 while the total potassium concentrations for the eastern group had a mean of 0.25 mg/L and ranged from 0.10 to 0.51 mg/L. Dissolved potassium concentrations for the western group had a mean of 0.31 mg/L and ranged from 0.11 to 0.86 mg/L while dissolved potassium concentrations for the eastern group had a mean of 0.24 mg/L and ranged from 0.10 to 0.46 mg/L (Appendix 9.3A1). No criterion exists for total or dissolved Potassium.

Alkalinity

The alkalinity concentrations for the western group of stations had a mean of 19.33 mg/L and ranged from 1.55 to 33 mg/L, while the concentrations for the eastern group had a mean of 8.62 mg/L and ranged from 1.55 to 26 mg/L (Appendix 9.3A1). These alkalinity concentrations indicate that the water has a low buffering capacity and limited availability of inorganic carbon.

Generally, alkalinity concentrations for streams along the transportation corridor varied inversely with discharge; sampling events with the highest discharge values were characterized by low alkalinity concentrations relative to sampling events with the lowest discharge values.

The most stringent criterion for alkalinity is a minimum requirement of 20 mg/L (ADEC CALC). Fifteen of the 16 surface water sample stations along the road corridor were found to have alkalinity concentrations less than 20 mg/L on at least one sampling event. The eastern group of stations all had alkalinity below 20 mg/L during each sampling event, with the exception of GS-6A during September and October 2004 (20.8 and 20.0 mg/L respectively). For the western group, 41 percent of their alkalinity results were below 20 mg/L.

Sulfate

Sulfate concentrations for the western group of stations had a mean of 6 mg/L and ranged from 0.91 to 59.10 mg/L, while concentrations of the eastern group had a mean of 6 mg/L and ranged from 0.53 to 33.90 mg/L (Appendix 9.3A1). The water quality criterion for sulfate is 250 mg/L

Chloride

Chloride concentrations for the western group of stations had a mean of 1 mg/L and ranged from 0.42 to 2.33 mg/L, while concentrations of the eastern group also had a mean of 1 mg/L and ranged from 0.31 to 1.7 mg/L (Appendix 9.3A1). The most stringent criterion for alkalinity is a minimum requirement of 230 mg/L (ADEC CALC).

Fluoride

Fluoride concentrations for the western group of stations were below the MRL for nearly all results. Concentrations that were above the MRL ranged from 0.10 to 0.12 mg/L (Appendix 9.3A1). Fluoride concentrations for the eastern group were below the MRL in all instances. The water quality criterion for fluoride is 4.0 mg/L

Hardness

Hardness concentrations for the western group of stations had a mean of 21 mg/L and ranged from 6.59 and 40.30 mg/L, while concentrations for the eastern group had a mean of 12 mg/L and ranged from 2.98 to 25.60 mg/L (Appendix 9.3A1). Hardness concentrations varied with alkalinity concentrations; the highest alkalinity concentrations for a given station correspond with the highest hardness values for that station. No criterion exists for hardness.

Summary of Major Ions

In general, total and dissolved calcium, magnesium, sodium, and potassium concentrations were at their lowest values immediately following periods of high discharge (breakup and fall precipitation events) and at their highest during periods of low discharge (winter and summer months). Monthly patterns may be difficult to correlate across the entire study area due to climatic variation (differences in the timing and intensity of precipitation events) in the study area.

Concentrations of the major ions at individual sampling locations were converted to milliequivalents per liter and plotted on piper diagrams (Appendix 9.3D). The total proportions of the major cations (calcium, magnesium, sodium, and potassium) were plotted on one triangle of the piper diagram, the major anions (alkalinity as bicarbonate, chloride, and sulfate) were plotted on another triangle of the diagram, and the information from these two triangles was plotted on a third triangle. A piper diagram displays water chemistry data and indicates the overall composition of major ions in the water. Based on the samples collected for this study, both the eastern and western groups of streams along the study area would be classified as calcium bicarbonate water.

9.3.6.3. Nutrients

Total Ammonia

The majority of all total ammonia (as N) results were below the MRL (Appendix 9.3A1). Those results that were above the MRL were all less than 0.5 mg/L, and thus well below the most stringent maximum water quality criterion (CALC).

Nitrate and Nitrite

Total nitrate+nitrite (as N) concentrations for the western group of stations had a mean of 1 mg/L and ranged from undetected to 8.09 mg/L, concentrations for the eastern group also had a mean of 1 mg/L and ranged from undetected to 26.4 mg/L (Appendix 9.3A1). The MDL for total nitrate+nitrite (as N) is approximately 0.3 mg/L. Only one result was found to be above the most stringent maximum water quality criterion (DWS of 10 mg/L). This was a concentration of 26.4 mg/L reported for station GS-3A in February 2005.

Phosphorus

The majority of the total phosphorus results for both groups of stations were reported as below the MRL (Appendix 9.3A1). When above the MRL, total phosphorous concentrations had a mean of 0.07 mg/L and ranged up to 0.65 mg/L.

Summary of Nutrients

In summary, total nitrate+nitrite was generally higher in the eastern group of stations than in the western group of stations. All but one sample from the eastern group was below the most stringent water quality maximum criterion. Average concentrations of the other nutrients were similar in all streams and were all below the most stringent water quality maximum criteria.

9.3.6.4. Total and Dissolved Trace Elements

The trace elements that are discussed in this section include aluminum, barium, iron, copper, zinc, lead, cadmium, arsenic, nickel, molybdenum, manganese, and low-level mercury. These elements were present predominately in the particulate fraction (total metal concentrations were much greater than the dissolved concentrations) for all stations. Total and dissolved trace element concentrations are shown graphically for individual sampling locations in Appendix 9.3E. Samples were analyzed for other trace elements (e.g., beryllium, bismuth, boron, selenium, silver, thallium, and tin), as presented in Appendix A2 of this EBD, but a majority of the results were undetected or were reported by the laboratory as below the reporting limit.

Aluminum

Total aluminum concentrations were naturally elevated at most of the stations during periods of high discharge, spring breakup, or after fall precipitation events. Eleven of the sixteen stations along the transportation corridor study area had their highest total aluminum concentrations during September 2004 or 2005. Total aluminum concentrations for the western group of stations had a mean of 95 µg/L and ranged from 4.86 to 925 µg/L, while the concentrations for the eastern group had a mean of 153 µg/L and ranged from 7.35 to 1,360 µg/L. Dissolved aluminum concentrations for the western group had a mean of 15 µg/L and ranged from 1 to 57 µg/L while dissolved aluminum concentrations for the eastern group had a mean of 13 µg/L and ranged from 3.5 to 58 µg/L.

Total aluminum concentrations were frequently above the most stringent maximum water quality criterion (ADEC CALC of 87 µg/L) during high discharge events. Two stations were above the ADEC CALC for total aluminum for most of the year: GS-4A from the eastern sampling group and NHRIV from the western sampling group on 75 percent and 58 percent of sampling events respectively.

Barium

Total barium concentrations for the western group of stations had a mean of 4.91 µg/L and ranged from 1.26 to 13.5 µg/L, while dissolved concentrations had a mean of 4.19 µg/L and ranged from 1.28 to 11.0 µg/L (Appendix 9.3A1). Total barium concentrations for the eastern group of stations had a mean of 8.14 µg/L and ranged from 0.62 to 21.3 µg/L, while dissolved concentrations had a mean of 6.62 µg/L and ranged from 0.60 to 15.1 µg/L (Appendix 9.3A1). The water quality criterion for barium is 2,000 µg/L.

Iron

Total iron concentrations for the western group of stations had a mean of 208 µg/L and ranged from 4 to 2,110 µg/L, while dissolved concentrations had a mean of 55.4 µg/L and ranged from undetected to 215µg/L. Total iron concentrations for the eastern group had a mean of 108 µg/L and ranged from non-detect to 826 µg/L (Appendix 9.3A1), while dissolved concentrations had a mean of 24.7 µg/L and ranged from non-detect to 123 µg/L.

Total iron concentrations were naturally elevated above the most stringent maximum water quality criterion (ADEC CALC of 1,000 µg/L) at the western sampling locations GS-14A, in September 2004, and at GS-14B, in September 2005 (Appendix 9.3A1). All other results from the study area were below 1,000 µg/L.

Copper

The highest total and dissolved copper concentrations typically occurred during or immediately following the periods of highest discharge, either during spring breakup or fall precipitation events.

Copper concentrations were relatively low in the western group of stations compared to the eastern group. Total copper concentrations for the western group of stations had a mean of 1 µg/L and ranged from 0.19 to 2.07 µg/L. Dissolved copper concentrations for the western group of stations had a mean of 0.4 µg/L and ranged from 0.11 to 1.36 µg/L (Appendix 9.3A1). Total copper concentrations for the eastern group had a mean of 4 µg/L and ranged from undetected to 34.6 µg/L. Dissolved copper concentrations for the eastern group of stations had a mean of 2.7 and ranged from 0.20 to 26 µg/L.

The most stringent maximum water quality criterion (ADEC CALC) for copper is dependent upon the hardness concentration of each individual stream. The CALC for total copper for streams along the transportation corridor study area, based on hardness data collected during this study, ranged from 0.48 to 3.33 µg/L. The CALC for dissolved copper ranged from 0.46 to 3.19 µg/L. Only one station from the western group was above the CALC for copper: GS-11A for total copper in October 2004. Five of the seven eastern stations were above the CALC for total copper, including GS-3A on 55 percent of sampling events, and GS-4A on 100 percent of sampling events. Three of the eastern stations were above the CALC for dissolved copper, including GS-3A on 45 percent of sampling events and GS-4A on 92 percent of sampling events.

Zinc

Total and dissolved zinc concentrations at stations along the study area were not readily correlated with discharge; however, a moderate increase in concentration was common during the fall precipitation period of high discharge. Total zinc concentrations for the western group of stations had a mean of 3 µg/L and ranged from undetected to 14.3 µg/L. Dissolved zinc concentrations for the western group of stations ranged from undetected to 13 µg/L. Concentrations for the eastern group had a mean of 4 µg/L and ranged from undetected to 18.5 µg/L for total zinc and ranged from undetected to 17 µg/L for dissolved zinc (Appendix 9.3A1).

The most stringent maximum water quality criterion (ADEC CALC) for zinc is dependent upon the hardness concentration of each individual stream. The CALC for total zinc for streams along the study area, based on hardness data collected during this study, ranged from 6.2 to 43.1 µg/L. The CALC for dissolved zinc ranged from 6.18 to 42.47 µg/L. Samples with concentrations above the total zinc CALC were collected at stations in the eastern group. Two of these stations (GS-8A and GS-4A) were only above the CALC on one of 12 sampling events, while the other (GS-23) was above the CALC on two of four sampling events. No samples with concentrations above the total zinc CALC were collected in the western group.

Lead

Total and dissolved lead concentrations at stations along the study area were not readily correlated with discharge; naturally elevated values are reported both during the high discharge, fall precipitation events as well as during the low discharge, winter sampling events. Over 50 percent of the lead results are undetected. Total lead for streams along the study area, based on hardness data collected during this study, ranged from 0.011 to 1.20 µg/L, and dissolved lead ranged from undetected to 0.35 µg/L (Appendix 9.3A1).

Total lead concentrations for the western group of stations had a mean of 0.128 µg/L and ranged from undetected to 1.06 µg/L, while dissolved concentrations had a mean of 0.125 µg/L and ranged from undetected to 0.35 µg/L (Appendix 9.3A1). Total lead concentrations for the eastern group of stations had a mean of 0.145 µg/L and ranged from undetected to 1.2 µg/L, while dissolved concentrations had a mean of 0.13 µg/L and ranged from undetected to 0.4 µg/L (Appendix 9.3A1).

The most stringent maximum water quality criterion (ADEC CALC) for lead is dependent upon the hardness concentration of each individual stream. The CALC for total lead for streams along the study area, based on hardness data collected during this study, ranged from 0.038 to 0.684 µg/L. The CALC for dissolved lead ranged from 0.049 to 0.662 µg/L. Most stations had results that were above the ADEC CALC for lead. Concentrations above the CALC were typically measured in either fall or winter months (Appendix 9.3A1).

Cadmium

Total cadmium for streams along the study area, based on hardness data collected during this study, ranged from 0.003 to 2.19 µg/L (Appendix 9.3A1). Total cadmium concentrations were undetected for the majority of sampling events at all stations along the study area. Total and dissolved cadmium concentrations at stations along the area are not readily correlated with discharge; the isolated sampling events when total cadmium concentrations were above the MRL occurred at various times of the year.

Total cadmium concentrations for the western group of stations had a mean of 0.042 µg/L and ranged from undetected to 2.19 µg/L, while dissolved concentrations had a mean of 0.02 µg/L and ranged from undetected to 0.06 µg/L. Total cadmium concentrations for the eastern group of stations had a mean of 0.02 µg/L and ranged from undetected to 0.07 µg/L, while dissolved concentrations had a mean of 0.02 µg/L and ranged from undetected to 0.075 µg/L (Appendix 9.3A1).

The most stringent maximum water quality criterion (ADEC CALC) for cadmium is dependent upon the hardness concentration of each individual stream. Total cadmium concentrations for six samples were above the water quality criteria for cadmium, five from the western group and one from the eastern group. Dissolved cadmium concentrations for three samples were above the water quality criteria for cadmium.in sample location GS4A.

Arsenic

The majority of surface water sample locations along the study area contained arsenic at concentrations below the MRL for the majority of sample events (Appendix 9.3A1) for both total and dissolved arsenic. Those stations that did regularly have arsenic at concentrations above the MRL never had arsenic above the most stringent maximum water quality criterion (ADEC DWS 10 µg/L). Only at one station on one occasion was total arsenic found to exceed the DWS: station GS-8A in February 2005. This result (21.1

µg/L) is anomalous; all other arsenic concentrations for GS-8A are either undetected or below the MRL for total and dissolved concentrations. The anomalous value may represent contamination or a laboratory error.

Nickel

Total nickel for streams along the transportation corridor study area ranged from 0.020 to 21.1 µg/L. Total nickel concentrations for the western group of stations had a mean of 0.29 µg/L and ranged from undetected to 0.63 µg/L, while dissolved concentrations had a mean of 0.35 µg/L and ranged from undetected to 0.56 µg/L. Total nickel concentrations for the eastern group of stations had a mean of 0.021 µg/L and ranged from undetected to 0.06 µg/L, while dissolved concentrations had a mean of 0.028 µg/L and ranged from undetected to 0.052 µg/L (Appendix 9.3A1).

The most stringent maximum water quality criterion (ADEC CALC) for nickel is dependent upon the hardness of the individual stream. The CALC for total nickel for streams along the transportation corridor study area, based on hardness data collected during this study, ranged from 2.73 to 18.73 µg/L. Nickel concentrations for the 16 stations along the study area were all below the CALC.

Molybdenum

Molybdenum concentrations were commonly below the MRL and rarely above 1 µg/L. Total molybdenum concentrations for the western group of stations had a mean of 0.64 µg/L and ranged from undetected to 1.53 µg/L, while dissolved concentrations had a mean of 0.65 µg/L and ranged from undetected to 1.59 µg/L. Total molybdenum concentrations for the eastern group of stations had a mean of 0.37 µg/L and ranged from undetected to 1.0 µg/L, while dissolved concentrations had a mean of 0.41 µg/L and ranged from undetected to 1 µg/L (Appendix 9.3A1).

The ADEC has not established DWS or CALC for molybdenum for fresh water.

Manganese

For several stations in the western sample groups, manganese levels were naturally elevated during September 2004 or 2005 (Appendix 9.3E). These elevated total concentration values occurred during high-discharge, fall precipitation events and were not accompanied by increases in the dissolved concentration. This indicates that the elevated values may be due to increases in the particulate fraction. Total manganese concentrations for the western group of stations had a mean of 12.8 µg/L and ranged from 0.5 to 156 µg/L, while dissolved concentrations had a mean of 5.2 µg/L and ranged from undetected to 33.2 µg/L. Total manganese concentrations for the eastern group of stations had a mean of 11.2 µg/L and ranged from undetected to 54.5 µg/L, while dissolved concentrations had a mean of 0.67 µg/L and ranged from undetected to 31.5 µg/L (Appendix 9.3A1).

The most stringent maximum water quality criterion of manganese (ADEC Human Health) is 50 µg/L. Several stations (GS-14A, GS-14B, GS-20, and GS-4A) were above this criterion during the high flows in September.

Low-Level Mercury

Mercury was undetected for the majority of sampling events for all stations along the transportation corridor study area, and none of the detected concentrations were above the most stringent maximum water quality criterion (ADEC CALC 0.77 µg/L; Appendix 9.3A1).

Summary of Total and Dissolved Trace Elements

In summary, the concentrations of individual trace elements were within the most stringent ADEC water quality criteria in most cases. Exceptions include aluminum, copper, lead, and zinc, which were above maximum criteria in a handful of cases. Typically, samples with a low field pH had the higher concentrations of metals.

The total metals concentrations generally increase with discharge because metal-bearing particles are often mobilized and carried in suspension by high flows, or are adsorbed onto sediment and transported as the sediment is mobilized by high flow.

9.3.6.5. Cyanide

Total cyanide and weak acid dissociable (WAD) cyanide were analyzed in water quality samples collected at all the sites. The majority of results for total and WAD cyanide are undetected.

The ADEC water quality regulations specify analysis of free cyanide by the WAD cyanide method, and the result is then applied to the free cyanide CALC of 0.0052 mg/L to address the most stringent water quality criterion. Cyanide WAD samples were above the CALC for two sample stations in July 2004: GS-11A and GS-14B. Both results were 0.0077 mg/L. GS-11A and GS-14B contained WAD cyanide at levels below the MRL on all other sampling events. No other samples were above the CALC for cyanide along the study area during the sampling campaign (Appendix 9.3A1).

The cyanide method reporting limit of 0.005 mg/L is nearly the same concentration as the regulatory limit of 0.0052 mg/L, which means the low level results are difficult to reproduce and are subject to false negatives and false positives.

9.3.6.6. Organic Compounds

Three sites (GS-20, GS-17A, and GS-7A) were sampled for organic constituents, including pesticides, volatile compounds, and semivolatile compounds in October 2004. The results for all parameters analyzed were undetected (Appendix 9.3F). A list of the organic constituents is presented in the 2005 Quality Assurance Project Plan (Appendix G of this EBD).

9.3.6.7. Stream Sediment Summary

Sediment samples were collected from 16 sites along the transportation corridor study area within the Bristol Bay drainages. These sample sites correspond with water quality sample sites (Figure 9.3-1). When sediments are flushed from the streambed during high flow, they can contribute to the concentration of trace elements in surface water, which is evident in the study area by the elevated levels of certain metals that were reported in the surface water samples collected at breakup and after fall precipitation events.

Sediment samples were collected in May, July, and September in 2004 and 2005. Chapter 10 of the Environmental Baseline document provides analytical results and further discussion of the stream sediment data.

9.3.7. Summary

In 2004 and 2005, surface water quality samples were collected along the transportation-corridor; Bristol Bay drainages study area for the Pebble Project as part of the environmental baseline study. Sixteen sample locations were established along a representative road alignment segment of this study area. By the end of the sampling program in 2005, the focus of the sampling effort was narrowed to nine representative stream locations.

Surface water samples were analyzed for a set of field parameters, and then samples were sent to an ADEC-approved laboratory for analyses for a suite of inorganic compounds and metals. In addition, the laboratory analyzed three streams for organic compounds on one sampling event (Appendix 9.3F). All field parameters are presented graphically for individual sampling locations in Appendix 9.3B, and all qualified laboratory results are presented in Appendix 9.3A1.

A comparison of the results of the field and laboratory analyses to water quality criteria established by the ADEC (ADEC, 2003a, 2003b) shows that all sample stations had values that were not within the most stringent water quality criteria for at least one parameter on at least one sampling event. This occurred most frequently for alkalinity (below the minimum criterion), and for aluminum, and iron (above the maximum criterion).

Water Temperature (degC)	50 / 50	100%	0.09 - 22.0	NA - NA	NA - NA	6.84	6.58	4.88	5.24

Notes:

a. Frequency of detection (FOD) = Number of detected samples / total number of samples in data set.

b. When calculating the average, median, and standard deviation, non-detects with "U" or "UJ" qualifiers were included as one-half the RDL. Non-detect results of zero, without "U" or "UJ" qualifiers, were included as one-half the MDL.

Max = maximum
Min = minimum
MRL = method reporting limit.
MDL = method detection limit.
mg/L = milligram per liter.
MEQ/L = milliequivalent per liter.
mV = millivolt.
µS/cm = microsiemens per centimeter.
NTU = nephelometric turbidity unit.
degC = degrees Celsius.
-- = Not applicable.

Table 9.3-3
Surface Water Data Summary for Naturally Occurring Constituents, Western Transporation-corridor Bristol Bay Drainages (2004-2005)

Analyte	Frequency of Detection (FOD)[a]	Percent Detected	Range of Detects (Min - Max)	Range of MRLs (Min - Max)	(MDL) (Min - Max)	Average [b]	Median [b]	Standard Deviation [b]	Coefficient of Variation
Miscellaneous Parameters (mg/L, except where noted)									
Acidity, Total	2 / 82	2%	0.79 - 9.5	1.57 - 3.14	5 - 10	2.6	2.1	1.7	0.7
Alkalinity, Total	74 / 82	90.0%	1.60 - 33.0	3.1 - 6.2	10 - 20	19	21	7	0
Hardness as CaCO3 (Not Filtered)	/		-	0.0147 - 0.8	0.46 - 1.53				0.50
pH (Field, Standard Units)	/		-	NA - NA	NA - NA				0.220
Specific Conductivity (Field, µS/cm)	82 / 82	100%	21.0000 - 600	NA - NA	NA - NA	70.000	60	66.000	1.00
Total Dissolved Solids	82 / 82	100%	10 - 126	3.1 - 3.1	10 - 10	4.350000	44.4	19.400000	0.40
Total Suspended Solids	73 / 82	89%	0.075 - 56	0.15 - 0.75	0.5 - 2.5	4.2	1.5	10.2	2.40
Water Temperature (degC)	80 / 80	100%	0.08 - 22.7	NA - NA	NA - NA	7.42	6.94	5.16	0.70

Notes:

a. Frequency of detection (FOD) = Number of detected samples / total number of samples in data set.

b. When calculating the average, median, and standard deviation, non-detects with "U" or "UJ" qualifiers were included as one-half the RDL. Non-detect results of zero, without "U" or "UJ" qualifiers, were included as one-half the MDL.

Max = maximum
Min = minimum
MRL = method reporting limit.
MDL = method detection limit.
mg/L = milligram per liter.
MEQ/L = milliequivalent per liter.
mV = millivolt.
µS/cm = microsiemens per centimeter.
NTU = nephelometric turbidity unit.
degC = degrees Celsius.
-- = Not applicable.

Water Temperature (degC)	**15**	**-**	**0.006**	**1.47**	**0.44**	**3**	**6.0%**

Notes:

a. From ADEC (2008 and 2009). Criteria are in mg/L unless otherwise specified.

b. Other criteria are identified as follows:
   I = Irrigation water.
   S = Stock water.
   WO = Consumption of water + organism.
   O = Consumption of organism only.

c. CRR = Concentration/Criteria. Lowest available criteria were used to calculate CRRs.

d. Percent of samples represents the number of samples with CRRs>1 divided by the total number of samples analyzed.

e. Cyanide criteria are for free cyanide, as CN/L. Weak Acid Dissociable cyanide data were also compared to these criteria since separate criteria were not available.

f. pH must be within the given range of 6.0-8.5 (ADEC, 2009). CRRs were not calculated for pH. Number of samples and Percent of Samples represent samples with pH values outside of the given range.

Bold indicates at least one CRR greater than one (1.0).
CRR = Concentration risk ratio.
mg/L = Milligrams per liter.
degC = degrees Celsius.
ADEC = Alaska Department of Environmental Conservation.
Min = Minimum.
Max = Maximum.
- = Not available or not applicable.
> = Greater than.

pH (Field, Standard Units)[k]	**6.5-8.5**	**6.5-8.5**	**4.69**	**8.59**	**6.49**	**26**	**52%**
Total Dissolved Solids	1,000	1,000	1.6	110	8.3	0	0%
Water Temperature (degC)[l]	-	-	-	-	-	-	-

Notes:

a. From ADEC (2008 and 2009). Criteria are in mg/L unless otherwise specified.

b. Criteria listed as "A" are hardness-dependent. Criteria listed as "C", "D", or "E" are pH-dependent. Calculated criteria are presented in parentheses. Equations are provided below.
Acute and Chronic hardness-dependent criteria can be calculated using the following equations:
Acute Criteria (mg/L) = $[\exp(m_A(\ln(\text{hardness}))+b_A)*(CF)]/1{,}000$
Chronic Criteria (mg/L) = $[\exp(m_C(\ln(\text{hardness}))+b_C)*(CF)]/1{,}000$
Input values are provided in Table 9.1-9. The 5th percentile of hardness throughout the East Bristol Bay Drainage was used to calculate criteria.
Acute and Chronic pH-dependent criteria can be calculated using the following equations:
Acute (mg/L) = $(0.275/(1+10^{7.204-pH}))+(39.0/(1+10^{pH-7.204}))$
Chronic (mg/L) = $((0.0577/(1+10^{7.688-pH}))+(2.487/(1+10^{pH-7.688})))*(\text{MIN}(2.85, 1.45*10^{0.028(25-T)}))$, where T = water temperature
Acute criteria assume that salmonids are present, and chronic criteria assume that early life stages of fish are present. Field pH measurements were used to calculate criteria.

c. CRR = Concentration/Criteria. Lowest available criteria were used to calculate CRRs.

d. For analytes with CRRs >1, individual CRRs (greater than 1 only) and corresponding sample locations and dates are shown in Table 9.1-10.
Percent of samples represents the number of samples with CRRs>1 divided by the total number of samples analyzed.

e. Aquatic life criteria are for dissolved constituents unless otherwise specified. Where criteria were available only for total constituents, both total and dissolved data were compared to the total criteria.

f. Aquatic life criteria were only available for Cr^3 and Cr^6, not for total chromium. Cr^3 values were used for this comparison.

g. Only total mercury data were available, so these were compared to the aquatic life criteria, which are for dissolved mercury.

h. The acute selenium criteria calculation requires data for fractions of total selenium as selenite and selenate. These data were not available; therefore, only the chronic criterion was used for comparison with surface water data.

i. Cyanide criteria are for free cyanide, as CN/L. Weak Acid Dissociable cyanide data were also compared to these criteria since separate criteria were not available.

j. Chronic criterion is a minimum criterion for alkalinity (as $CaCO_3$), unless natural alkalinity is lower. Surface water data were therefore not compared to this criterion.

k. pH must be within the given range of 6.5-8.5 (ADEC, 2009). CRRs were not calculated for pH. Number of samples and Percent of Samples represent samples with pH values outside of the given range.

l. Water quality standards for temperature range from 13-20 degC depending on fish use (ADEC, 2009). The average water temperature in the East Bristol Bay Drainage is well below the minimum criterion of 13 degC, with only occasional values (limited to the summer months) near or above the various criteria. All except one value are below the absolute criterion of 20 degC.

	6	NHRIV	10/05/05	NHRIV	1
				Total (6 locations)	32

Notes:

a. Only CRRs greater than 1, and the corresponding analytes, are shown in this table. Values for pH represent pH measurements at each location, not CRRs.

CRR = Concentration risk ratio.

TABLE 9.3-12

Comparison of Total and Dissolved Naturally Occurring Constituent Concentrations in Surface Water, Western Transportation-corridor Bristol Bay Drainages Study Area (2004-2005)

Analyte	T/D Significantly Different? [a]	p-Value	Mean Ranks		Sample Counts	
			Dissolved	Total	Dissolved	Total
Aluminum	**Yes**	**<0.0001**	**41**	**96**	**62**	**81**
Antimony	**Yes**	**0.022**	**39**	**51**	**41**	**49**
Arsenic	**Yes**	**0.047**	**44**	**55**	**45**	**54**
Barium	**Yes**	**0.043**	**74**	**89**	**81**	**82**
Beryllium [b]	-	-	0	4	0	7

Cadmium	No	0.48	11	13	12	11
Calcium	No	0.73	80	82	79	82
Chromium	No	0.053	46	57	44	60
Cobalt	**Yes**	**0.0062**	**54**	**73**	**57**	**71**
Copper	**Yes**	**0.01**	**67**	**86**	**71**	**82**
Iron	**Yes**	**<0.0001**	**55**	**85**	**65**	**77**
Lead	**Yes**	**0.0012**	**27**	**43**	**38**	**29**
Magnesium	No	0.59	80	84	81	82
Manganese	**Yes**	**0.0001**	**66**	**94**	**78**	**81**
Molybdenum	No	0.80	78	76	75	78
Nickel	**Yes**	**0.0076**	**72**	**55**	**47**	**75**
Potassium	No	0.94	82	82	81	82
Selenium	No	0.30	13	16	14	14
Silver [b]	No	0.77	4	3	2	3
Sodium	No	0.99	80	80	77	82
Thallium	No	0.49	5	3	2	4
Tin [b]	-	-	0	5	0	9
Vanadium	**Yes**	**0.0006**	**36**	**56**	**39**	**55**
Zinc	No	0.26	59	66	61	63

Notes:

a. Differences are considered statistically significant if the p-value is less than 0.050. The nonparametric Mann-Whitney U-test was used for statistical comparisons. Only detected concentrations were included in the statistical comparisons.

b. Each sample count must be greater than 1 to perform Mann-Whitney U-test.

T/D = total vs. dissolved.

< = less than.

- = not applicable.

Key:
Bold Results = Parameter undetected by test, value shown is 1/2 MDL or 1/2 MRL.
If result was not detected at the lab MDL, the value shown is 1/2 MDL.
If result was flagged U or UJ by validation, the value shown is 1/2 MRL.
Green Results = Estimate result reported by laboratory below reporting limit (MRL).
Red Results = Result exceed Chronic Aquatic Life Criteria and/or Drinking Water Standards.
MDL = Method Detection Limit.
MRL = Method Reporting Limit.
NA = Not Applicable , no limit established.
CALC = ADEC Chronic Aquatic Life Criteria
DWS = Drinking Water Standards -18 AAC 70, Water Quality Standards, under fresh water uses, (6)(A)(i) and (6)(C).
ADEC = Alaska Department of Environmental Conservation
EPA = Environmental Protection Agency
WAD Cyanide = Weak Acid Dissociable Cyanide
GS11A - example of surface water sampling station identification code

Footnotes:
(1) CALC come from the ADEC Alaska Water Quality Criteria Manual – Table III and from the ADEC Water Quality Standards for Fresh Water Uses under use (C).
(2) DWS come from the ADEC Alaska Water Quality Criteria Manual – Table I, the ADEC Water Quality Standards under use (A)(i), and EPA Primary Drinking Water Standards.
(3) Ammonia CALC limit dependent on calculated lowest 5th percentile of temperature and pH - these are preliminary estimates of the criteria.
(4) Cadmium, Chromium III, Copper, Lead, Nickel and Zinc CALC limits are dependent on Hardness lowest 5th percentile, these are preliminary estimates of the criteria.
(5) Criterion given is for free cyanide. ADEC has determined that the WAD cyanide method is to be used for analysis and the result is to be applied to the free cyanide criterion.
(6) Criterion given is the more stringent of those available for chromium III and chromium VI. Analysis is of total chromium.
(7) The Criterion given for total mercury concentration is based on the Alaska Water Quality Criteria Manual for Toxic and Other Deleterious Organic and Inorganic Substances, 2002.
(8) Criterion given is an acute criterion, rather than a chronic criterion. No chronic aquatic life criterion has been established for silver.
(9) Precision displayed in values may be less than actual where unit conversions were necessary, esp. Hg, Si, B.

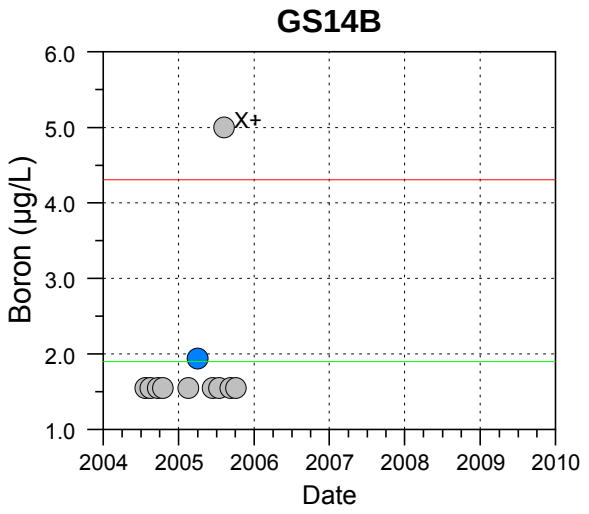
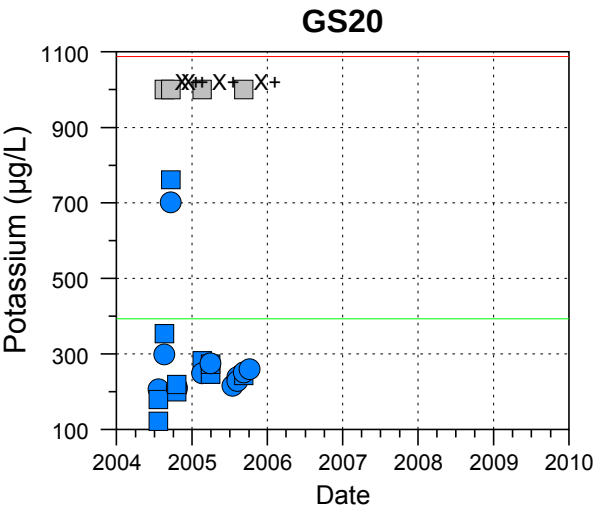
Key:

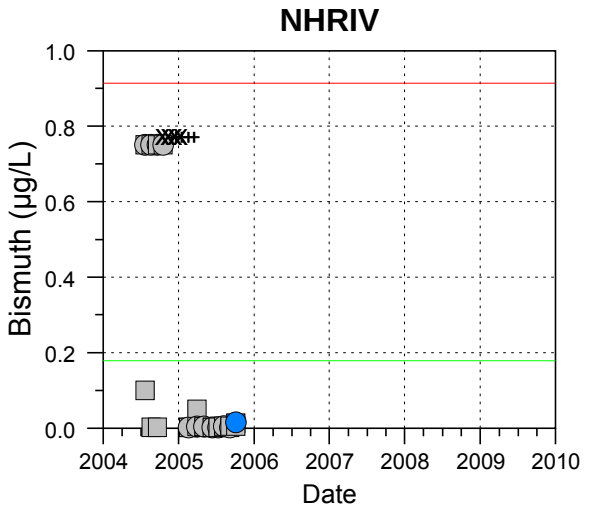
Bold Results = Parameter undetected by test, value shown is 1/2 MDL or 1/2 MRL.
If result was not detected at the lab MDL, the value shown is 1/2 MDL.
If result was flagged U or UJ by validation, the value shown is 1/2 MRL.
Green Results = Estimate result reported by laboratory below reporting limit (MRL).
Red Results = Result exceed applicable Chronic Aquatic Life Criteria and/or Drinking Water Standards.
MDL = Method Detection Limit.
MRL = Method Reporting Limit.
NA = Not Applicable , no limit established.
CALC = ADEC Chronic Aquatic Life Criteria
DWS = Drinking Water Standards -18 AAC 70, Water Quality Standards, under fresh water uses, (6)(A)(i) and (6)(C).
ADEC = Alaska Department of Environmental Conservation
EPA = Environmental Protection Agency
WAD Cyanide = Weak Acid Dissociable Cyanide

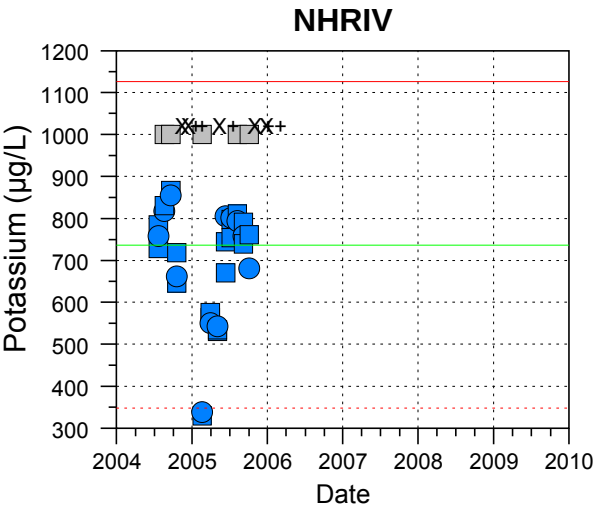
otnotes:

(1) CALC come from the ADEC Alaska Water Quality Criteria Manual – Table III and from the ADEC Water Quality Standards for Fresh Water Uses under use (C).
(2) DWS come from the ADEC Alaska Water Quality Criteria Manual – Table I, the ADEC Water Quality Standards under use (A)(i), and EPA Primary Drinking Water Standards.
(3) Ammonia CALC limit dependent on calculated lowest 5th percentile of temperature and pH.
(4) Cadmium, Chromium III, Copper, Lead, Nickel and Zinc CALC limits are dependent on Hardness lowest 5th percentile.
(5) Criterion given is for free cyanide. ADEC has determined that the WAD cyanide method is to be used for analysis and the result is to be applied to the free cyanide criterion.
(6) Criterion given is the more stringent of those available for chromium III and chromium VI. Analysis is of total chromium.
(7) The Criterion given for total mercury concentration is based on the Alaska Water Quality Criteria Manual for Toxic and Other Deleterious Organic and Inorganic Substances, 2002.
(8) Criterion given is an acute criterion, rather than a chronic criterion. No chronic aquatic life criterion has been established for silver.
(9) Precision displayed in values may be less than actual where unit conversions were necessary, esp. Hg, Si, B.









Legend

- Analytical Result
- Quality Control Sample Result
- Not Detected
- Upper 98% Confidence Level
- Mean
- Lower 98% Confidence Level

X+ outlier, very high value
GS20: Example of Sampling Station Identification

Notes:

1) Non detect (ND) values are treated as values in the data analysis at 0.5 x MDL (Method Detection Limit) for unflagged data or 0.5 x MRL (Method Reporting Limit) in the case of U-flagged data (Data below the MRL).

2) Some non detect values were marked as outliers because they were higher than other actual data values, or because they were much higher than other non-detect values, and therefore would have skewed the data analysis.

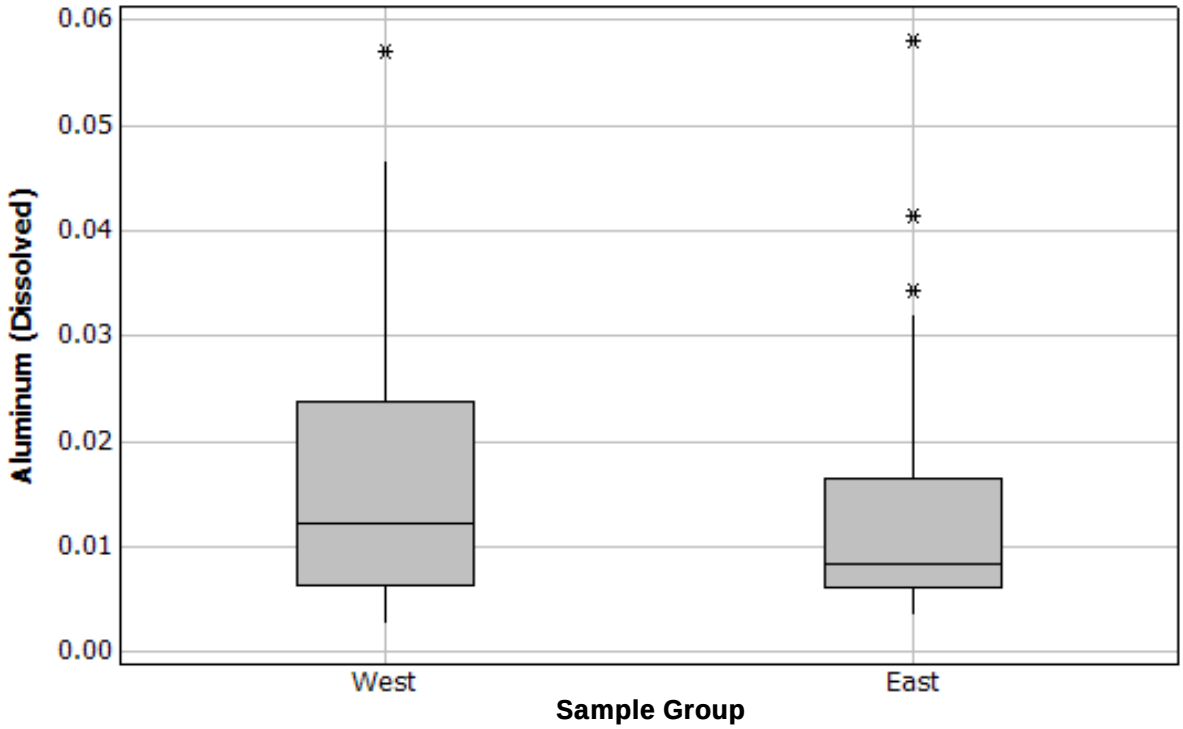
Key:
µg/L = micrograms per liter
MDL = method detection limit
ND = parameter is undetected

APPENDIX 9.3G

Box and Whisker Plots
2004-2005 Surface Water
Transportation-corridor, Bristol Bay Drainages Study Area
Eastern and Western Sample Groups

APPENDIX G

BOX AND WHISKER PLOTS BY SAMPLE GROUP



Most Stringent ADEC Water Quality Criterion 0.087

Notes:

Analyte concentrations are in milligrams per liter (mg/L).

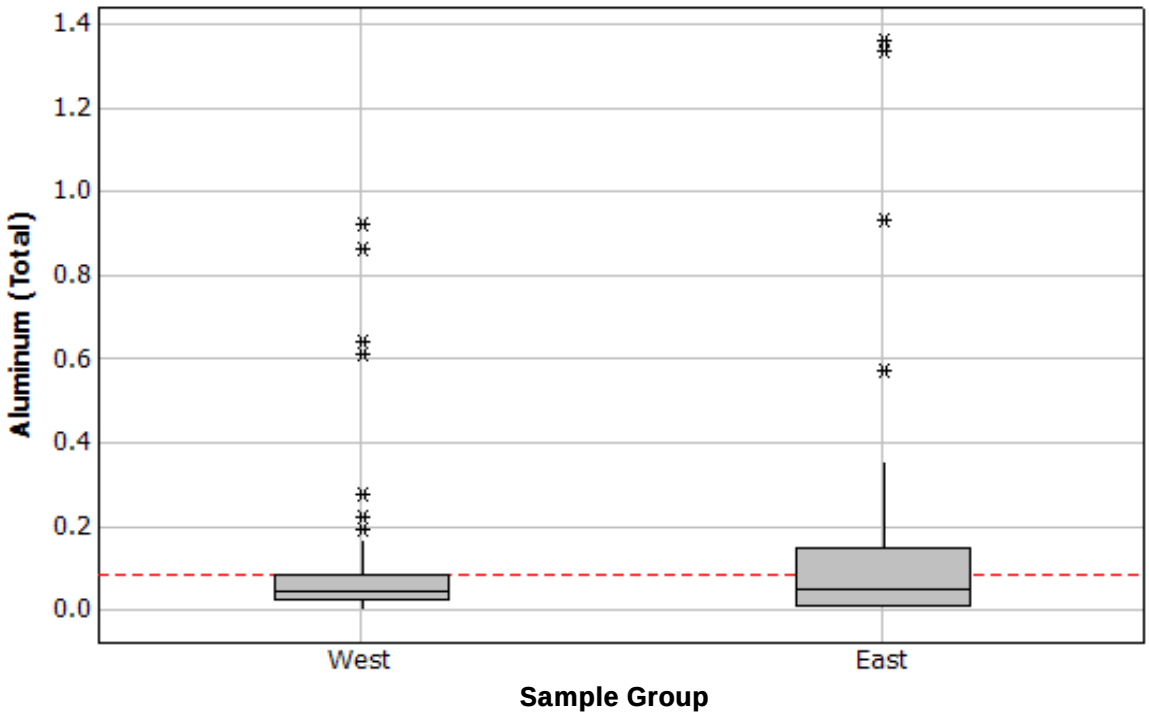
Only detected values are shown.

West = Bristol Bay Western Sample Group (Western Sample Stations = GS-11A, GS-12A, GS, 14A, GS-14B, GS-17A, GS-18A, GS-20, GS-20A, and Newhalen River [NHRIV]).

East = Bristol Bay Eastern Sample Group (Eastern Sample Stations = GS-3A, GS-4A, GS-4B, GS-6A, GS-7A, GS-8A, and GS-23).

The length of the box represents the interquartile range of the analyte and contains 50 percent of the results. The line inside the box represents the median value, and the smallest and largest results are represented by the length of the lines protruding from the box ends. Outliers are represented by asterisks.

The red dashed line on each figure, and the criterion noted below each figure, represent the most stringent Drinking Water Standards (DWS) or Chronic Aquatic Life Criteria (CALC) from ADEC (2008 and 2009). If a criterion was outside the scale of the plot, then no line is shown. If neither a line nor a criterion is shown, then no criterion was available. Harness based on CALC criteria are preliminary estimates.



Most Stringent ADEC Water Quality Criterion 0.087

Notes:

Analyte concentrations are in milligrams per liter (mg/L).

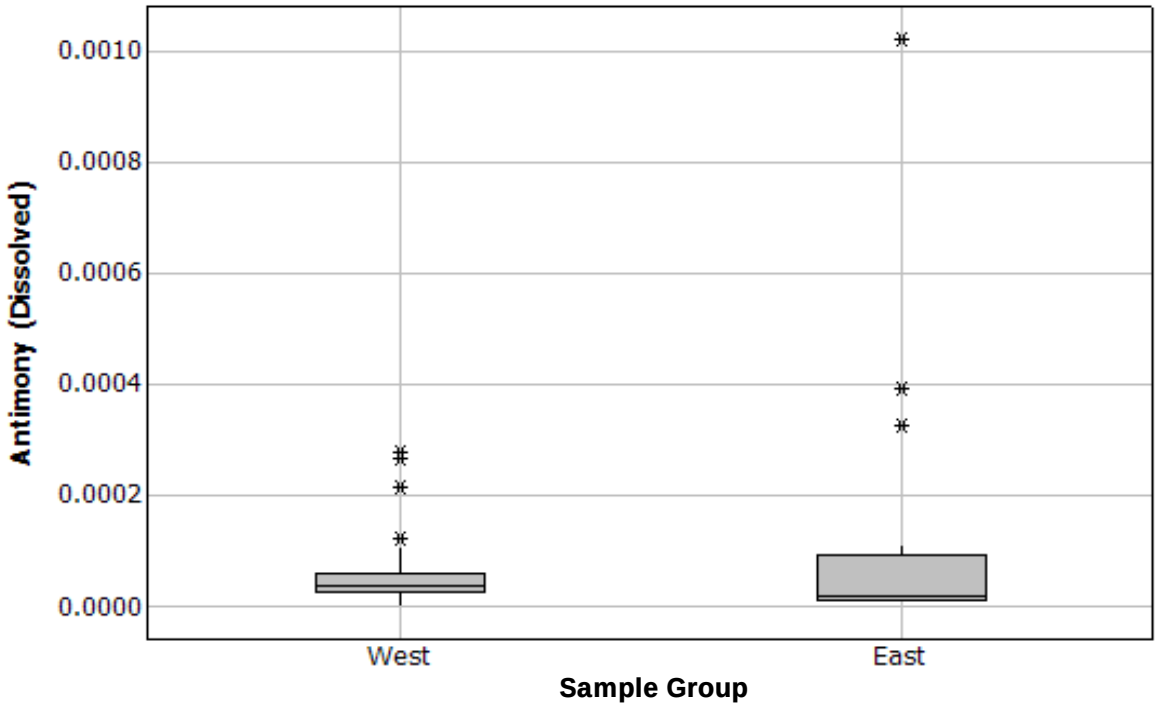
Only detected values are shown.

West = Bristol Bay Western Sample Group (Western Sample Stations = GS-11A, GS-12A, GS, 14A, GS-14B, GS-17A, GS-18A, GS-20, GS-20A, and Newhalen River [NHRIV]).

East = Bristol Bay Eastern Sampler Group (Eastern Sample Stations = GS-3A, GS-4A, GS-4B, GS-6A, GS-7A, GS-8A, and GS-23).

The length of the box represents the interquartile range of the analyte and contains 50 percent of the results. The line inside the box represents the median value, and the smallest and largest results are represented by the length of the lines protruding from the box ends. Outliers are represented by asterisks.

The red dashed line on each figure, and the criterion noted below each figure, represent the most stringent Drinking Water Standards (DWS) or Chronic Aquatic Life Criteria (CALC) from ADEC (2008 and 2009). If a criterion was outside the scale of the plot, then no line is shown. If neither a line nor a criterion is shown, then no criterion was available. Hardness based on CALC criteria are preliminary estimates.



Notes:

Analyte concentrations are in milligrams per liter (mg/L).

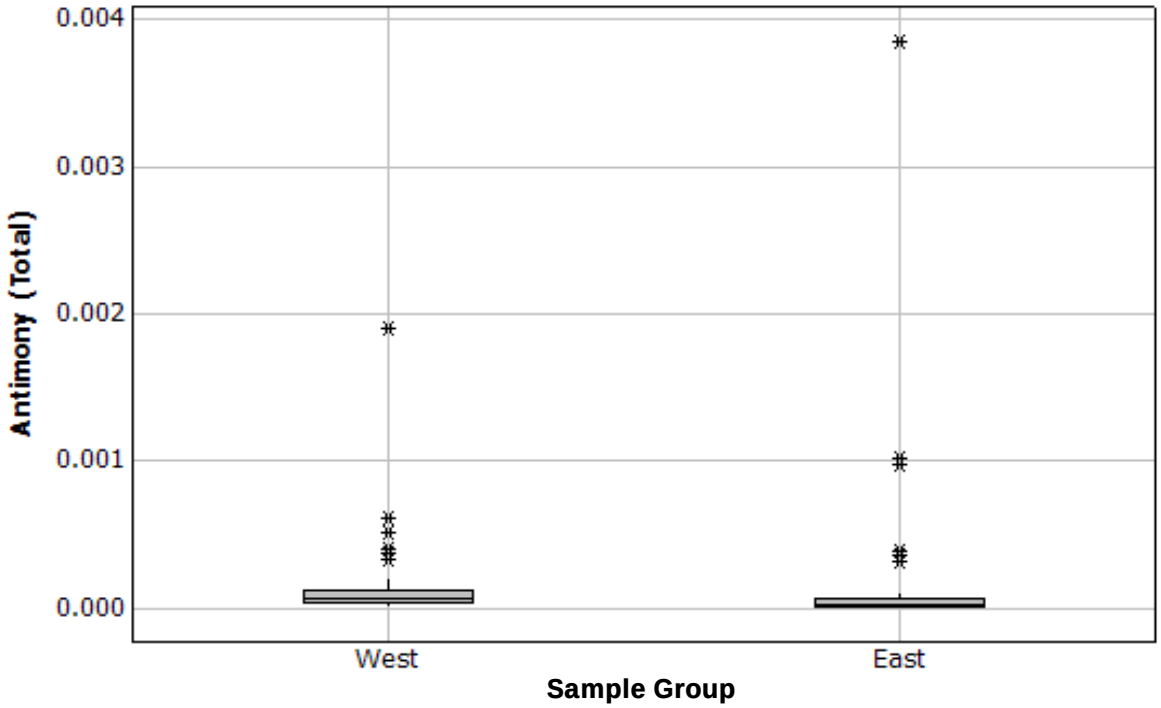
Only detected values are shown.

West = Bristol Bay Western Sample Group (Western Sample Stations = GS-11A, GS-12A, GS, 14A, GS-14B, GS-17A, GS-18A, GS-20, GS-20A, and Newhalen River [NHRIV]).

East = Bristol Bay Eastern Sample Group (Eastern Sample Stations = GS-3A, GS-4A, GS-4B, GS-6A, GS-7A, GS-8A, and GS-23).

The length of the box represents the interquartile range of the analyte and contains 50 percent of the results. The line inside the box represents the median value, and the smallest and largest results are represented by the length of the lines protruding from the box ends. Outliers are represented by asterisks.

The red dashed line on each figure, and the criterion noted below each figure, represent the lowest Drinking Water Standards (DWS) or Chronic Aquatic Life Criteria (CALC) from ADEC (2008 and 2009). If a criterion was outside the scale of the plot, then no line is shown. If neither a line nor a criterion is shown, then no criterion was available. Hardness based CALC criteria are preliminary estimates.



Most Stringent ADEC Water Quality Criterion 0.0060

Notes:

Analyte concentrations are in milligrams per liter (mg/L).

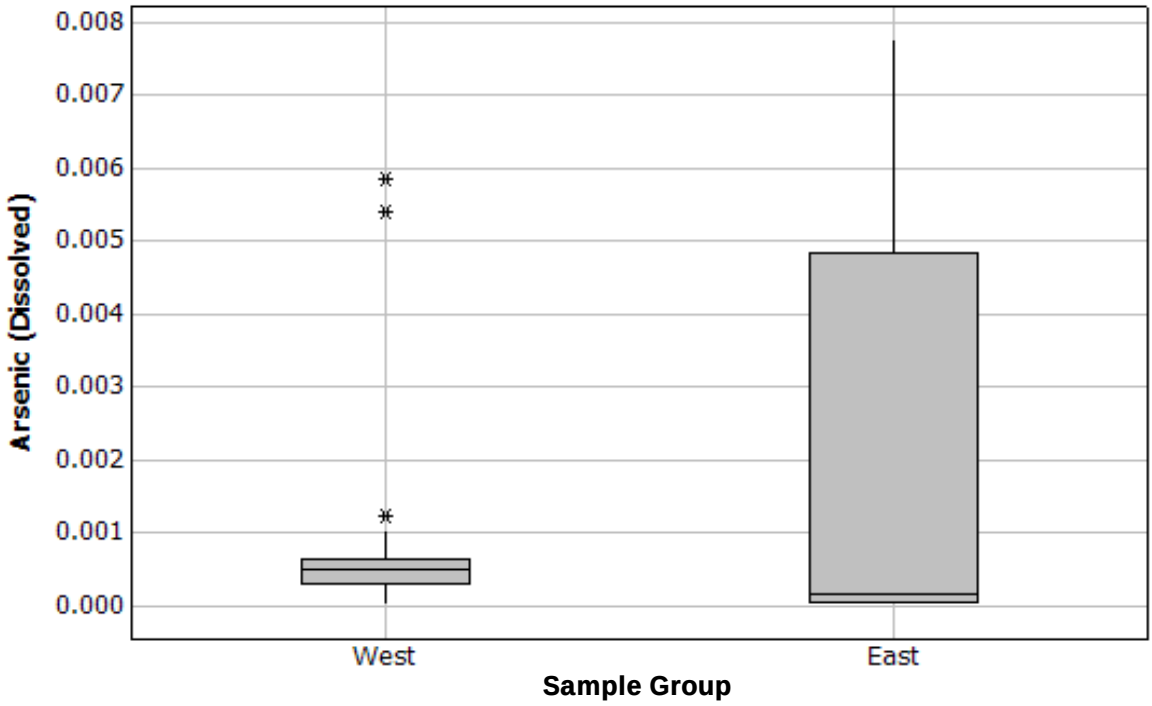
Only detected values are shown.

West = Bristol Bay Western Sample Group (Western Sample Stations = GS-11A, GS-12A, GS, 14A, GS-14B, GS-17A, GS-18A, GS-20, GS-20A, and Newhalen River [NHRIV]).

East = Bristol Bay Eastern Sample Group (Eastern Sample Stations = GS-3A, GS-4A, GS-4B, GS-6A, GS-7A, GS-8A, and GS-23).

The length of the box represents the interquartile range of the analyte and contains 50 percent of the results. The line inside the box represents the median value, and the smallest and largest results are represented by the length of the lines protruding from the box ends. Outliers are represented by asterisks.

The red dashed line on each figure, and the criterion noted below each figure, represent the most stringent Drinking Water Standards (DWS) or Chronic Aquatic Life Criteria (CALC) from ADEC (2008 and 2009). If a criterion was outside the scale of the plot, then no line is shown. If neither a line nor a criterion is shown, then no criterion was available. Hardness based CALC criteria are preliminary estimates.



Most Stringent ADEC Water Quality Criterion 0.15

Notes:

Analyte concentrations are in milligrams per liter (mg/L).

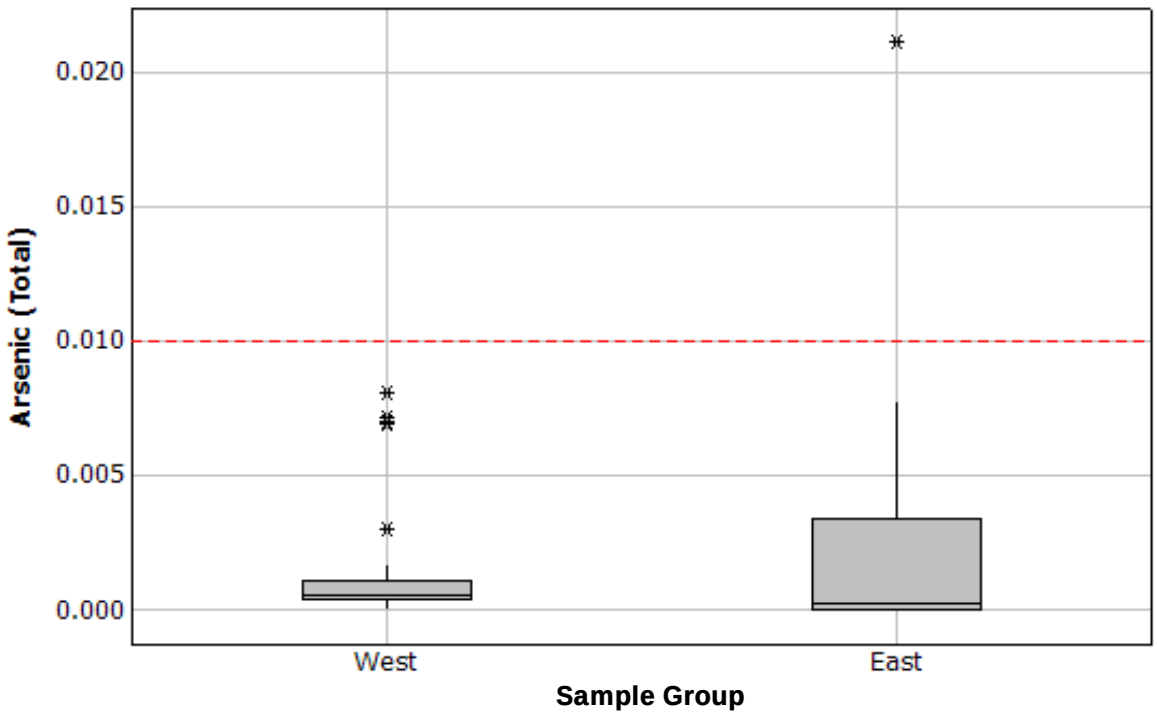
Only detected values are shown.

West = Bristol Bay Western Sample Group (Western Sample Stations = GS-11A, GS-12A, GS, 14A, GS-14B, GS-17A, GS-18A, GS-20, GS-20A, and Newhalen River [NHRIV]).

East = Bristol Bay East Sample Group (Eastern Sample Stations = GS-3A, GS-4A, GS-4B, GS-6A, GS-7A, GS-8A, and GS-23).

The length of the box represents the interquartile range of the analyte and contains 50 percent of the results. The line inside the box represents the median value, and the smallest and largest results are represented by the length of the lines protruding from the box ends.Outliers are represented by asterisks.

The red dashed line on each figure, and the criterion noted below each figure, represent the most stringent Drinking Water Standards (DWS) or Chronic Aquatic Life Criteria (CALC) from ADEC (2008 and 2009). If a criterion was outside the scale of the plot, then no line is shown. If neither a line nor a criterion is shown, then no criterion was available. Hardness based CALC criteria are preliminary estimates.



Most Stringent ADEC Water Quality Criterion 0.010

Notes:

Analyte concentrations are in milligrams per liter (mg/L).

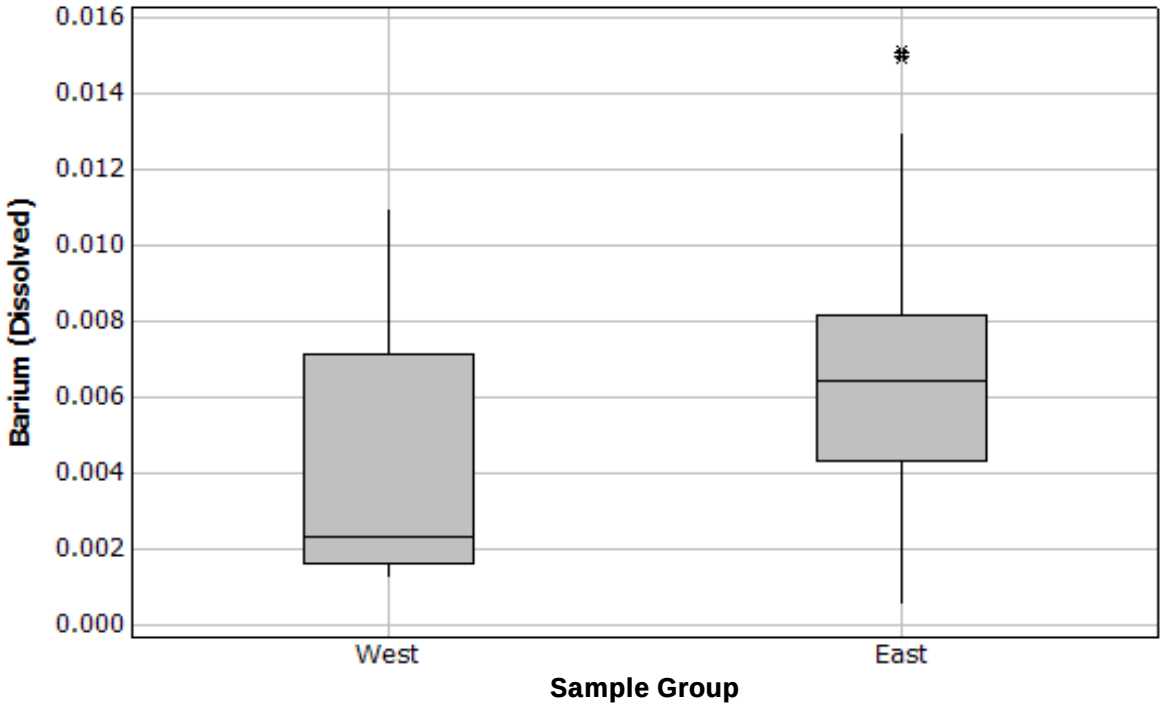
Only detected values are shown.

West = Bristol Bay Western Sample Group (Western Sample Stations = GS-11A, GS-12A, GS, 14A, GS-14B, GS-17A, GS-18A, GS-20, GS-20A, and Newhalen River [NHRIV]).

East = Bristol Bay Eastern Sample Group (Eastern Sample Stations = GS-3A, GS-4A, GS-4B, GS-6A, GS-7A, GS-8A, and GS-23).

The length of the box represents the interquartile range of the analyte and contains 50 percent of the results. The line inside the box represents the median value, and the smallest and largest results are represented by the length of the lines protruding from the box ends.Outliers are represented by asterisks.

The red dashed line on each figure, and the criterion noted below each figure, represent the most stringent Drinking Water Standards (DWS) or Chronic Aquatic Life Criteria (CALC) from ADEC (2008 and 2009). If a criterion was outside the scale of the plot, then no line is shown. If neither a line nor a criterion is shown, then no criterion was available. Hardness based CALC criteria are preliminary estimates.



Notes:

Analyte concentrations are in milligrams per liter (mg/L).

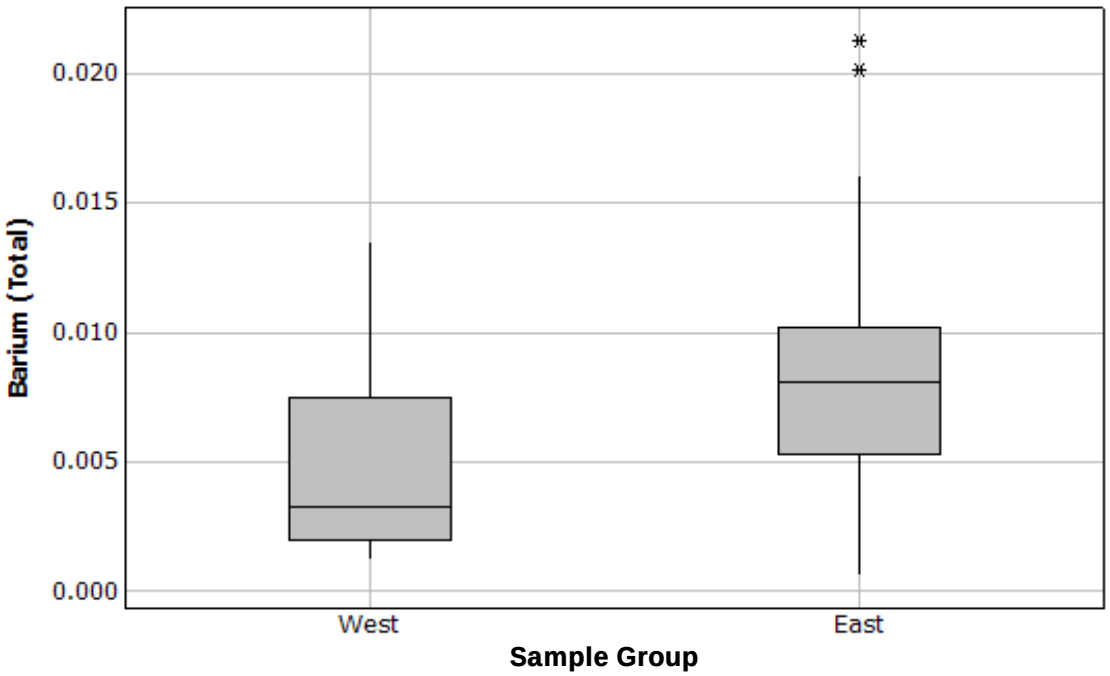
Only detected values are shown.

West = Bristol Bay Western Sample Group (Western Sample Stations = GS-11A, GS-12A, GS, 14A, GS-14B, GS-17A, GS-18A, GS-20, GS-20A, and Newhalen River [NHRIV]).

East = Bristol Bay Eastern Sample Group (Eastern Sample Stations = GS-3A, GS-4A, GS-4B, GS-6A, GS-7A, GS-8A, and GS-23).

The length of the box represents the interquartile range of the analyte and contains 50 percent of the results. The line inside the box represents the median value, and the smallest and largest results are represented by the length of the lines protruding from the box ends. Outliers are represented by asterisks.

The red dashed line on each figure, and the criterion noted below each figure, represent the most stringent Drinking Water Standards (DWS) or Chronic Aquatic Life Criteria (CALC) from ADEC (2008 and 2009). If a criterion was outside the scale of the plot, then no line is shown. If neither a line nor a criterion is shown, then no criterion was available. Hardness based CALC criteria are preliminary estimates.



Most Stringent ADEC Water Quality Criterion 2.00

Notes:

Analyte concentrations are in milligrams per liter (mg/L).

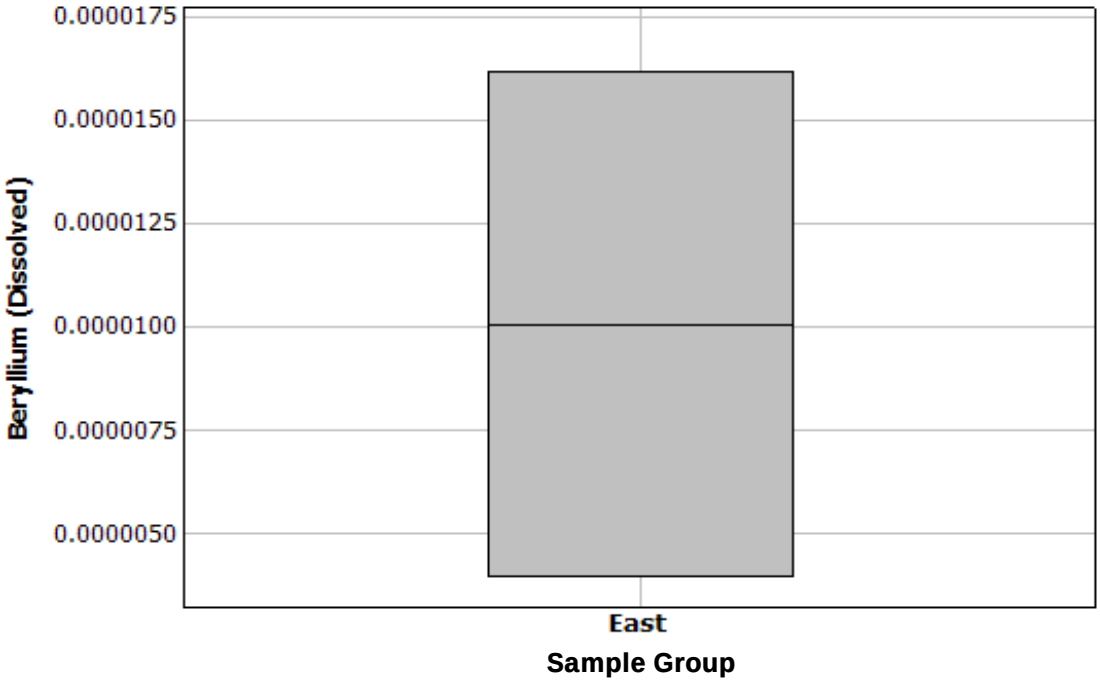
Only detected values are shown.

West = Bristol Bay Western Sample Group (Western Sample Stations = GS-11A, GS-12A, GS, 14A, GS-14B, GS-17A, GS-18A, GS-20, GS-20A, and Newhalen River [NHRIV]).

East = Bristol Bay Eastern Sample Group (Eastern Sample Stations = GS-3A, GS-4A, GS-4B, GS-6A, GS-7A, GS-8A, and GS-23).

The length of the box represents the interquartile range of the analyte and contains 50 percent of the results. The line inside the box represents the median value, and the smallest and largest results are represented by the length of the lines protruding from the box ends. Outliers are represented by asterisks.

The red dashed line on each figure, and the criterion noted below each figure, represent the most stringent Drinking Water Standards (DWS) or Chronic Aquatic Life Criteria (CALC) from ADEC (2008 and 2009). If a criterion was outside the scale of the plot, then no line is shown. If neither a line nor a criterion is shown, then no criterion was available. Hardness based CALC criteria are preliminary estimates.



Notes:

Analyte concentrations are in milligrams per liter (mg/L).

Only detected values are shown.

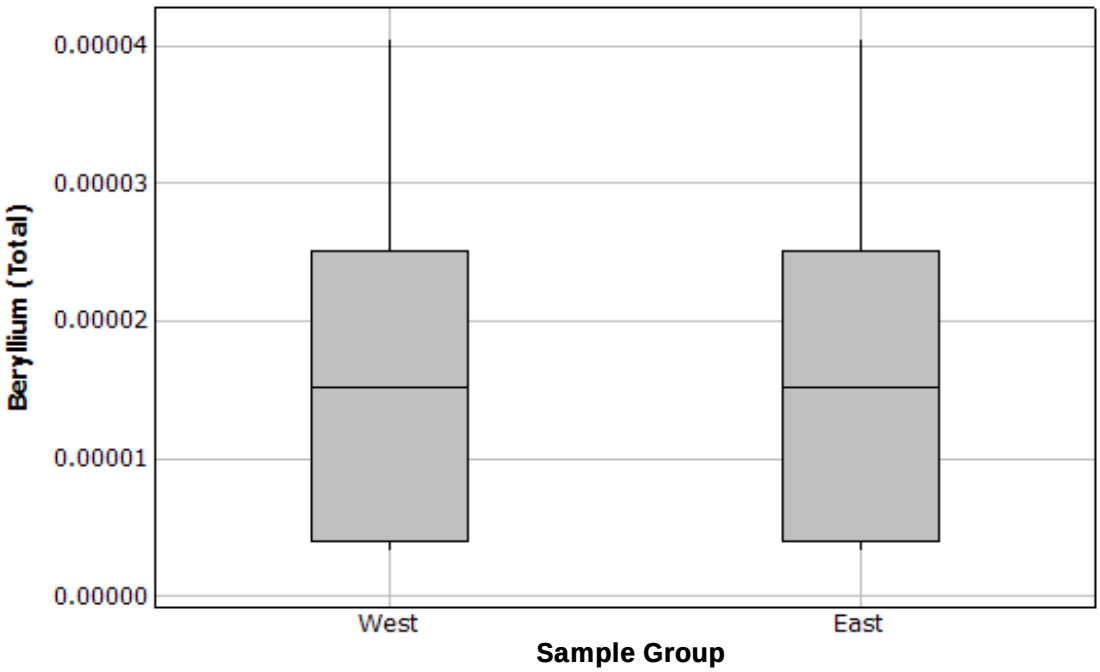
Bristol Bay Western Sample Group had no detected values and therefore is not depicted.

West = Bristol Bay Western Sample Group (Western Sample Stations = GS-11A, GS-12A, GS, 14A, GS-14B, GS-17A, GS-18A, GS-20, GS-20A, and Newhalen River [NHRIV]).

East = Bristol Bay Eastern Sample Group (Eastern Sample Stations = GS-3A, GS-4A, GS-4B, GS-6A, GS-7A, GS-8A, and GS-23).

The length of the box represents the interquartile range of the analyte and contains 50 percent of the results. The line inside the box represents the median value, and the smallest and largest results are represented by the length of the lines protruding from the box ends. Outliers are represented by asterisks.

The red dashed line on each figure, and the criterion noted below each figure, represent the most stringent Drinking Water Standards (DWS) or Chronic Aquatic Life Criteria (CALC) from ADEC (2008 and 2009). If a criterion was outside the scale of the plot, then no line is shown. If neither a line nor a criterion is shown, then no criterion was available. Hardness based CALC criteria are preliminary estimates.



Most Stringent ADEC Water Quality Criterion 0.0040

Notes:

Analyte concentrations are in milligrams per liter (mg/L).

Only detected values are shown.

West = Bristol Bay Western Sample Group (Western Sample Stations = GS-11A, GS-12A, GS, 14A, GS-14B, GS-17A, GS-18A, GS-20, GS-20A, and Newhalen River [NHRIV]).

9.4. Drinking Water Characterization – Transportation Corridor

9.4.1. Introduction

This section presents the findings of the 2004 and 2005 drinking water characterization study for community wells within the transportation corridor study area in the Bristol Bay drainage

The objective of the drinking water quality study was to characterize groundwater used for drinking water in the communities within the Bristol Bay drainages near the Pebble Project.

9.4.2. Study Area

The transportation-corridor, Bristol Bay drainages study area is generally bounded by the Newhalen River in the west, the northern shore of Iliamna Lake in the south, the outlet of Lake Clark and the base of Roadhouse Mountain in the north, and the drainage divide between Bristol Bay and Cook Inlet drainages in the east. The study area is more specifically defined by the location of the sampling stations as depicted in Figure 9.0-2. For this study, the study area was extended to include the communities of Iliamna, Newhalen and Nondalton. The community of Pedro Bay, located within the corridor, is also included in this study. Most of the population in the study area resides in these communities, with a few isolated, outlying, individual residences, most of which are occupied on a seasonal basis only.

9.4.3. Scope of Work

One drinking water well from each community identified in the study area was selected for sampling (Figure 9.4-1). The wells sampled include the following:

- The Nondalton City Well.
- Newhalen Public Well #2.
- Iliamna Weathered Inn Well.
- The Pedro Bay Tribal Council Well.

Wells were sampled in July and October 2004, and in March, July, and October 2005. Bristol Environmental and Engineering Services Corporation conducted the work.

9.4.4. Methods

9.4.4.1. Site Selection

In each community, a representative well was identified through discussions with local village corporations and governments. In each case, a well with high usage in the community was chosen as the representative well for the community.

In Nondalton approximately 70 residences are connected to the piped water and sewer system. Two wells supply water for Nondalton and are both piped to the well house. In 2004 and 2005, Well #1 was not in service, and therefore water samples for this study were collected from Well #2. Nondalton Well # 2,

located on the shore of Six Mile Lake, was installed in 1978 to a depth of 32 feet below ground surface. Based on the location of the well, it is likely groundwater is under the influence of surface water. Due to the well producing arsenic concentrations in the drinking water above U.S. Environmental Protection Agency (EPA) maximum contaminant levels of 10 µg/L, the City of Nondalton is planning on building a new water treatment plant in 2007.

Drinking water in Newhalen is derived from a well and is treated at the washeteria. A piped water system serves 40 homes in the community. For this study, Newhalen well #2 was sampled in 2004 and 2005. The well was installed in 1942 to a depth of 405 feet below ground surface.

Iliamna residents are using individual water wells and septic systems. There is no well installation or construction information for the Iliamna Weathered Inn well that was sampled for this study.

Most of the occupied homes in Pedro Bay use individual wells and septic systems. In Pedro Bay water is also derived from Iliamna Lake and from the washeteria. For this study, the Pedro Bay Tribal Council well was sampled in 2004 and 2005. The well was drilled in 1990 to a depth of 70 feet. The well was extended in 2002 to a depth of 147 feet.

9.4.4.2. Drinking Water Sampling Procedures

The consultant conducted field sampling in accordance with Chapter 6 of the consolidated study program for Pebble Project (a copy of which is provided in Appendix E of this environmental baseline document [EBD]). Quality Assurance/Quality Control (QA/QC) protocols followed procedures outlined in the Quality Assurance Project Plan in Appendix G.

Field personnel recorded drinking water parameters in the field, including temperature, pH, dissolved oxygen, specific conductance, turbidity, and oxidation-reduction potential. In 2004, field personnel measured field parameters using a Horiba Model U-10 Water Quality Checker. In 2005, field personnel measured field parameters using an YSI 556 Multi-Probe System. Field personnel recorded field parameters in the logbook or on data sheets.

For each drinking water sample, water was poured directly into the sample containers from the tap after running the water for several minutes. For the Nondalton and Newhalen wells, the water was sampled from the wellhead, prior to chlorination. Water from the Iliamna and Pedro Bay wells is not treated; water samples were collected from the tap at these locations.

9.4.4.3. Analysis

Only primary sample data were used for analyses in this EBD. Duplicate and triplicate sample data were only used for evaluation of precision. Only sample locations from which analytical data were collected were included in the evaluation. Both field and laboratory data were available for pH and specific conductivity; but only field pH and specific conductivity data were incorporated into the quantitative evaluation because these measurements are more representative of field conditions than laboratory pH data.

General statistics were compiled for each dataset and included the following parameters:

- Minimum and maximum detected concentrations.

- Sample-specific minimum and maximum method detection limits (MDLs) and method reporting limits (MRLs).
- Number of results detected.
- Number of samples analyzed.
- Frequency of detection.
- Arithmetic average and median concentrations.
- Standard deviations and coefficients of variation.

Non-detect results were included for statistical summaries as one-half the MDL, and non-detect results that were qualified as estimated were included as one-half the MRL. For all other statistical analyses, only detected concentrations were included to avoid skewing the datasets based on multiple non-detect values. Outliers are presented in Appendix 9.4A1.

The summary statistics are listed on the tables in Appendix 9.4A2. The Laboratory Data Table highlights values that are undetected, results that exceed the applicable water quality criteria, and results reported by the laboratory as being below the MRL, which is also referred to in the appendices as the practical quantitation limit (PQL). Only validated data were used in the summary tables and graphs. See Appendix A of the EBD, Analytical Data QA/QC, for a data quality assessment.

At the time of sample collection, the following field parameters were measured and recorded in 2004 and 2005:

- Dissolved oxygen.
- pH.
- Specific conductivity.
- Water temperature.
- Stream discharge.

In 2006 and 2007, the same set of field parameters were measured, except for stream discharge.

9.4.5. Results and Discussion

This section discusses and summarizes the field parameters and qualified laboratory analytical results from drinking water well samples collected in July 2004 through October 2005 along the transportation-corridor, Bristol Bay drainages study area.

Photographs of the drinking water well sample locations are provided in the photograph section at the end of this chapter. The data and summary statistics and field parameter data are provided in Appendices 9.4A and 9.4B. Based on the samples collected for this study, the Iliamna Weathered Inn, Nondalton, and Pedro Bay wells would be classified as calcium-bicarbonate type water and the Newhalen well would be classified as sodium-bicarbonate type water. The mean total dissolved solids ranged from 57 to 100 milligrams per liter (mg/L) in all the wells and was below the maximum drinking water standard (DWS) of 500 mg/L. Analytical results were compared to criteria from the primary and secondary maximum contaminant levels for drinking water in the ADEC Alaska Water Quality Criteria Manual (ADEC,

2003b). Arsenic and field pH were the only parameters that are reported as being over or outside the DWS.

Arsenic is a naturally occurring chemical element in rock and soil, and is often present in trace amounts in groundwater. Concentrations of arsenic in groundwater are generally associated with volcanic deposits and gold-mining areas, and arsenic is a major constituent of iron-sulfide and copper-sulfide minerals (Welch et al., 2000). High concentrations of arsenic in groundwater are largely the result of these minerals dissolving naturally over time from weathered rock and soils.

The Newhalen well had one total arsenic value reported as an exceedance from the sample collected in October 2005. The ADEC DWS for total arsenic is 10 micrograms per liter (µg/L). The total arsenic values from the Newhalen well ranged from 6.17 to 13.0 µg/L. A 2003 public water system summary for a Newhalen well reported arsenic concentrations from two samples collected in 2002 and 2003 to be 8.0 and 4.5 µg/L, respectively.

Exceedences were reported for total arsenic in four out of the five sampling events from the Nondalton well. Total arsenic ranged from 8.8 to 14.2 µg/L from the Nondalton well.

The Pedro Bay well had one reported total arsenic value exceeding the DWS from the July 2005 sampling event. The total arsenic values from the Pedro Bay well ranged from 9.35 to 10.5 µg/L. No water quality information was available from any previous public water supply summary reports for the Pedro Bay well.

The only other parameter reported outside the DWS is field pH. The ADEC DWS for pH is 6.0 to 8.5 (Appendix 9.4B). The field pH in all the wells ranged from 5.1 to 9.5. The Newhalen well consistently tended to have the highest pH values ranging from 8 to 9.5, whereas Pedro Bay's field pH ranged from 5.7 to 8.9, the Nondalton pH values were all close to 7, and the field pH for the Iliamna Weathered Inn well ranged from 5.1 to 8.9.

Aluminum, boron, copper, iron, and zinc were reported with the highest concentrations of all the trace elements that were analyzed by the laboratory. There are no DWS associated with these trace elements. The Newhalen well had the highest concentrations of aluminum, boron, copper, and iron. The mean highest total and dissolved zinc concentrations were reported in the Iliamna Weathered Inn well at 9 µg/L. In all the wells the mean total aluminum concentrations ranged from 9 to 127 µg/L, and the mean dissolved aluminum concentrations ranged from 6 to 19µg/L; the mean total copper concentrations ranged from 1 to 65 µg/L, and mean dissolved copper concentrations ranged from 1 to 2 µg/L; the mean total boron concentrations ranged from 3 to 26 µg/L, and the mean dissolved boron concentrations ranged from 2 to 30 µg/L; the mean total iron concentration ranged from 5 to 102 µg/L, and the mean dissolved iron concentrations ranged from 6 to 17 µg/L; and the mean total zinc concentrations ranged from 5 to 9 µg/L, and the mean dissolved zinc concentrations ranged from 2 to 9 µg/L.

9.4.6. Summary

In 2004 and 2005, drinking water quality samples were collected from four community wells within the transportation-corridor, Bristol Bay Drainages study area for the Pebble Project as part of the environmental baseline study. One well in each of the four communities was sampled as a representative well for the community.

Field personnel analyzed drinking water well samples for a set of parameters in the field and sent samples to an ADEC-approved laboratory for analyses for a suite of inorganic compounds and metals. All field parameter results are presented in Appendix 9.4B, and all laboratory results are presented in the Laboratory Data Table located in Appendix 9.4A.

Field and laboratory analytical results were compared to DWS as listed in the *Alaska Water Quality Criteria Manual for Toxic and Other Deleterious Organic and Inorganic Substances* (ADEC 2003a). A comparison of the results of the laboratory analyses to water quality criteria established by the ADEC shows DWS exceedences for total arsenic from the Newhalen, Nondalton, and Pedro Bay wells. There were no exceedences reported for any of the parameters analyzed from the Iliamna Weathered Inn well, except for field pH. Newhalen and Pedro Bay wells had field pH outside the range of the ADEC DWS for pH.

Key:
Bold Results = Parameter undetected by test, value shown is 1/2 MDL.
If result was not detected at the lab MDL, the value shown is 1/2 MDL.
If result was validation flagged U or UJ, the value shown is 1/2 MRL.
Green Results = Estimate result reported by laboratory below reporting limit (MRL).
Red Results = Result exceed applicable Chronic Aquatic Life Criteria and/or Drinking Water Standards.
MDL = Method Detection Limit.
MRL = Method Reporting Limit.
NA = Not Applicable , no limit established.
CALC = ADEC Chronic Aquatic Life Criteria
DWS = Drinking Water Standards -18 AAC 70, Water Quality Standards, fresh water uses, (6)(A)(i) and (6)(C).
ADEC = Alaska Department of Environmental Conservation
EPA = Environmental Protection Agency
WAD Cyanide = Weak Acid Dissociable Cyanide
mg/L = Milligrams per Litre (Parts per Pillion)
µg/L = Micrograms per Litre (Parts per Billion)

Footnotes:
(1) CALC come from the ADEC Alaska Water Quality Criteria Manual – Table III and from the ADEC Water Quality Standards for Fresh Water Uses under use (C).
(2) DWS come from the ADEC Alaska Water Quality Criteria Manual – Table I, the ADEC Water Quality Standards under use (A)(i), and EPA Primary Drinking Water Standards.
(3) Total Ammonia CALC limit dependent on calculated upper 95th percentile of temperature and pH.
(4) Cadmium, Chromium III, Copper, Lead, Nickel and Zinc CALC limits are preliminary estimates and are dependent on Hardness lowest 5th percentile.
(5) Criterion given is for free cyanide. ADEC has determined that the WAD cyanide method is to be used for analysis and the result is to be applied to the free cyanide criterion.
(6) Criterion given is the more stringent of those avalable for chromium III and chromium VI. Analysis is of total chromium.
(7) The Criterion given for total mercury concentration is based on the Alaska Water Quality Criteria Manual for Toxic and Other Deleterious Organic and Inorganic Substances, 2002.
(8) Criterion given for silver is an acute criterion, rather than a chronic criterion as no chronic aquatic life criterion has been established for silver. Acute limits are preliminary estimates and are dependent on Hardness lowest 5th percentile.
(9) Precision displayed in values may be less than actual where unit conversions were necessary, esp. Hg, Si, B.

9.5. Surface Water—Iliamna Lake

9.5.1. Introduction

An integrated study of water quality, mussel tissue, sediment, and zooplankton was conducted by HDR to characterize baseline conditions for Iliamna Lake. The Iliamna Lake study objectives, study area, scope of work, methods, and results are described in full in Appendix B of this environmental baseline document. A brief overview of the water quality portion of the Iliamna Lake study is presented below.

Sampling sites for the Iliamna Lake study were selected based on their proximity to the transportation corridor and populated communities. Five deeper-water sites were sampled for water quality monthly in May through October 2005 and 2007 – Pile Bay, Knutson Bay, Northeast Bay, Roadhouse Bay and Upper Talarik outlet. Four sites were sampled for water quality in September 2006 – Whistlewing Bay, Bucket Lake, Finn Bay and Flat Lake; Bucket Lake was also sampled in June 2007. Sampling did not take place at Upper Talarik Creek September 2005 due to weather conditions. The data collected provide baseline information on aquatic conditions in the lake.

9.5.2. Summary of Results and Discussion

The water data collected from Iliamna Lake suggest that Iliamna Lake is an oligotrophic, dimictic lake with water-quality conditions similar to the natural conditions of other regional lakes. Only a few parameters (e.g., copper, lead, aluminum, iron, zinc, manganese, and alkalinity) had results outside of the chronic aquatic life criteria (CALC) benchmarks from the Alaska Department of Environmental Conservation for fresh water. These concentrations are likely a result of geological influences and are consistent with previous studies conducted at Iliamna Lake and other area watersheds. Field parameters were within normal ranges, with the exception of a few slightly low pH measurements at Pile Bay, and are considered suitable for lake biota.

Concentrations of nutrients and major ions found during the Pebble Project study were similar to concentrations from a study conducted at Iliamna Lake nearly 40 years ago, with the exception of sodium, which was present at nearly twice the concentration found by the earlier study. Cation and anion dominance in Iliamna Lake is generally characteristic of temperate lakes. Sodium was more abundant than magnesium, however, suggesting a contribution from igneous rocks in the region. Depth was not found to have an effect on the concentrations of major ions, suggesting that waters at these sites were well-mixed. Several major ions and total dissolved solids were lower earlier in the summer, peaked in September, and declined again in October. These temporary increases may be associated with the influence of inflow from streams and of precipitation.

Temporal and spatial variations were evident in some of the water quality analytes. Pile Bay and Knutson Bay tended to exhibit similar concentrations, which were often different (usually higher) than the other three sites. Zinc reached peak concentrations in June and July at many sites. Copper, lead, zinc, and aluminum were found to be above the CALC or drinking water standards periodically at some sites. Alkalinity was almost always below the criteria at all sites, indicating that the system may not be able to buffer significant changes in pH. Mercury, cyanide and organics were rarely found to be above the method reporting limits during the course of the study.

Although these data provide insight into potential trends and baseline conditions of the lake, it is important to note that all findings are based on relatively small sample sizes; therefore, they must be interpreted with caution. Appendix B of this EBD presents a more integrated analysis of the water quality, mussel tissue, sediment and zooplankton sampling methodology and data.
