

Spring flooding at the Refuge field camp. (PF 5/93)

Although it was less severe, we did experience some fall flooding in September. Measures were taken to prevent water damage to equipment and boom those items which might float away. When WB/P Finley and BT Mallek left the camp for the season, water was within inches of the cabin.

Smoke jumpers from the Alaska Fire Service, Bureau of Land Management, and U.S. Forest Service completed fire presuppression at the field headquarters in June. They removed potential fuels from around the cabin, cache, sleeping structures, and fuel storage area. They also established a defensive fire line (trench) around the cabin facilities and fuel storage areas while raising our six wall-tent frames on barrels above the probable ground fire line.
