

Source Water Assessment

A Hydrogeologic Susceptibility and Vulnerability Assessment for Tundra Lodge RV Campground, Tok, Alaska PWSID #380997

DRINKING WATER PROTECTION PROGRAM REPORT NO. 912

Alaska Department of Environmental Conservation

Source Water Assessment for Tundra Lodge RV Campground, Tok, Alaska PWSID #380997

DRINKING WATER PROTECTION PROGRAM REPORT NO. 912

The Drinking Water Protection Program (DWPP) is producing Source Water Assessments in compliance with the Safe Drinking Water Act Amendments of 1996. Each assessment includes a delineation of the source water area, an inventory of potential and existing contaminant sources that may impact the water, a risk ranking for each of these contaminants, and an evaluation of the potential vulnerability of these drinking water sources.

These assessments are intended to provide public water systems owners/operators, communities, and local governments with the best available information that may be used to protect the quality of their drinking water. The assessments combine information obtained from various sources, including the U.S. Environmental Protection Agency, Alaska Department of Environmental Conservation (ADEC), public water system owners/operators, and other public information sources. The results of this assessment are subject to change if additional data becomes available. It is anticipated this assessment will be updated every five years to reflect any changes in the vulnerability and/or susceptibility of public drinking water source. If you have any additional information that may affect the results of this assessment, please contact the Program Coordinator of DWPP, (907) 269-7521.

Drinking Water Protection Program Alaska Department of Environmental Conservation

EXECUTIVE SUMMARY

The public water system for Tundra Lodge RV Campground is a Class B (transient/non-community) water system consisting of one well. The Tundra Lodge RV Campground is located at Mile 1315 of the Alaska Highway, in Tok, Alaska. The wellhead received a susceptibility rating of Low and the aquifer received a susceptibility rating of Very High. Combining these two ratings produces a Medium rating for the natural susceptibility of the well. Identified potential and current sources of contaminants for Tundra Lodge RV Campground public drinking water source include car washes without engine or undercarriage cleaning; laundromats drycleaning); large-capacity septic systems; singlefamily septic systems; RV dump stations; aboveground heating oil tanks; DEC-recognized contaminated site south of Tundra Lodge; paved highways and roads; and campgrounds and RV parks. Identified potential and existing sources of contamination are considered sources of bacteria and viruses, nitrates and/or nitrites. and volatile organic chemicals. Overall, the public water sources for Tundra Lodge RV Campground received a vulnerability rating of High for bacteria and viruses and nitrates and nitrites; and Medium for volatile organic chemicals.

TUNDRA LODGE RV CAMPGROUND PUBLIC DRINKING WATER SYSTEM

Tundra Lodge RV Campground public water system is a Class B (transient/non-community) water system. The system consists of one well located at Mile 1315 of the Alaska Highway, in Tok, Alaska (See Map 1 of Appendix A). Tok is located at the junction of the Alaska Highway and the Tok cutoff to the Glenn Highway, 200 miles southeast of Fairbanks. Tok is called the "Gateway to Alaska" as it is the first major community upon entering Alaska, 93 miles from the Canadian border. The population of Tok is approximately 1,400.

Tok averages about 15 inches of precipitation per year, including 33 inches of snow. Although the quality of the groundwater can vary significantly in a short distance, groundwater supplies are generally abundant in the area. Static water levels in these wells are generally 50 to 80 feet below the surface. The coarse, alluvial, sandy gravel aquifer provides sufficient water, even in the winter when infiltration is low.

The Tok area topography varies from about 1,275 feet along the Tanana River to over 5,000 feet in the Alaska Range. Drainages along the Alaska Highway in this area generally flow northwest.

According to a Sanitary Survey dated September 15, 1998, the well was installed in 1980 with 6-inch diameter casing to a depth of 100 feet below ground surface. The Survey indicates that the land surface is sloped away from the well, providing adequate surface water drainage. We are assuming since the well was installed prior to 1992 that it is not grouted according to ADEC standards. Proper grouting provides added protection against contaminants traveling along the well casing and into source waters.

This system operates seasonally from May to September and serves approximately 60 non-residents through one service connection.

TUNDRA LODGE RV CAMPGROUND DRINKING WATER PROTECTION AREA

In order to evaluate whether a drinking water source is at risk, we must first evaluate what are the most likely pathways for surface contamination to reach the groundwater. These areas are determined by looking at the characteristics of the soil, groundwater, aquifer, and well.

The most probable area for contamination to reach the drinking water well is the area that contributes water to the well, the groundwater recharge area. This area is designated as the Drinking Water Protection Area (DWPA). Because releases of contaminants within the DWPA are most likely to impact the drinking water well, this area will serve as the focus for voluntary protection efforts.

An analytical calculation was used to determine the size and shape of the DWPA. The input parameters describing the attributes of the aquifer in this calculation were estimated from information contained in the well logs and/or the Sanitary Survey. Additional methods were also used to take into account any uncertainties in groundwater flow and aquifer characteristics to arrive at a meaningful DWPA (Please refer to the Guidance Manual for Class B Public Water Systems for additional information).

The DWPAs established for wells by the ADEC are usually separated into four zones. These zones correspond to differences in the time-of-travel (TOT) of the water moving through the aquifer to the well.

The TOT for contaminants within the water varies and is dependent on the physical and chemical characteristics of each contaminant. The following is a summary of the four protection area zones for wells and the calculated time-of-travel for each:

Table 1. Definition of Zones

| Zone | Definition |
|------|---|
| A | ¹ / ₄ the distance for the 2-yr. time-of-travel |
| В | Less than the 2 year time-of-travel |
| C | Less Than the 5 year time-of-travel |
| D | Less than the 10 year time-of-travel |

The DWPA for Tundra Lodge RV Campground extends approximately 2 miles feet south of the well. Development in the vicinity of the well is limited to only Zone A (See Map 1 of Appendix A).

INVENTORY OF POTENTIAL AND EXISTING CONTAMINANT SOURCES

The Drinking Water Protection Program has completed an inventory of potential and existing sources of contamination within the Tundra Lodge RV Campground DWPA. This inventory was completed through a search of agency records and other publicly-available information. Potential sources of contamination to the drinking water aquifer include a wide range of categories and types. Potential drinking water contaminants are found within agricultural, residential, commercial, and industrial areas, but can also occur within areas that have little or no development.

For the basis of all Class B public water system assessments, three categories of drinking water contaminants were inventoried. They include:

- Bacteria and viruses;
- Nitrates and/or nitrites;
- Volatile organic chemicals

There are no sources of contamination for the Tundra Lodge RV Campground.

RANKING OF CONTAMINANT RISKS

Once the potential and existing sources of contamination have been identified, they are assigned a ranking according to what type and level of risk they represent. Ranking of contaminant risks for a "potential" or "existing" source of contamination is a function of toxicity and volumes of specific contaminants associated with that source. Rankings include:

- Low:
- Medium:
- High; and
- Very High.

The TOT for contaminants within the water varies and is dependent on the physical and chemical characteristics of each contaminant. Bacteria and Viruses are only inventoried in Zones A and B because of their short life span. Only "Very High" and "High" rankings are inventoried within the outer Zone D due to the probability of contaminant dilution by the time the contaminants get to the well.

Tables 2 through 4 in Appendix B contain the ranking of potential and existing sources of contamination with respect to bacteria and viruses, nitrates and/or nitrites, and volatile organic chemicals.

VULNERABILITY OF TUNDRA LODGE RV CAMPGROUND DRINKING WATER SYSTEM

Vulnerability of a drinking water source to contamination is a combination of two factors:

- Natural susceptibility; and
- Contaminant risks.

Appendix D contains eight charts, which together form the 'Vulnerability Analysis' for a source water assessment for a public drinking water source. Chart 1 analyzes the 'Susceptibility of the Wellhead' to contamination by looking at the construction of the well and its surrounding area. Chart 2 analyzes the 'Susceptibility of the Aquifer' to contamination by looking at the naturally occurring attributes of the water source and influences on the groundwater system that Chart 3 analyzes might lead to contamination. 'Contaminant Risks' for the drinking water source with respect to bacteria and viruses. The 'Contaminant Risks' portion of the analysis considers potential sources of contaminants as well as a review of contamination that has or may have occurred, but has not arrived or been detected at the well. Lastly, Chart 4 contains the 'Vulnerability Analysis for Bacteria and Viruses'. Charts 5 through 8 contain the Contaminant

Risks and Vulnerability Analyses for nitrates and nitrites and volatile organic chemicals, respectively.

A score for the Natural Susceptibility is reached by considering the properties of the well and the aquifer.

Susceptibility of the Wellhead
$$(0 - 25 \text{ Points})$$

(Chart 1 of Appendix D)

+

Susceptibility of the Aquifer (0 – 25 Points) Chart 2 of Appendix D)

=

Natural Susceptibility (Susceptibility of the Well) (0-50 Points)

A ranking is assigned for the Natural Susceptibility according to the point score:

Natural Susceptibility Ratings

| 40 to 50 pts | Very High |
|------------------|-----------|
| 30 to < 40 pts | High |
| 20 to < 30 pts | Medium |
| < 20 pts | Low |

The well for the Tundra Lodge RV Campground is completed in an unconfined aquifer. Because unconfined aquifers are recharged by surface water and precipitation that migrates downward from the surface, contaminants at the surface have the potential to adversely impact this aquifer. Table 2 shows the Susceptibility scores and ratings for the Tundra Lodge RV Campground.

Table 2. Susceptibility

| | Score | Rating |
|------------------------|-------|-----------|
| Susceptibility of the | | |
| Wellhead | 5 | Low |
| Susceptibility of the | | |
| Aquifer | 23 | Very High |
| Natural Susceptibility | 28 | Medium |
| | | |

Contaminant risks to a drinking water source depend on the type, number or density, and distribution of contaminant sources. This score has been derived from an examination of existing and historical contamination that has been detected at the drinking water source through routine sampling. It also evaluates potential sources of contamination. Flow charts are used to assign a point score, and ratings are assigned in the same way as for the natural susceptibility:

Contaminant Risk Ratings

| 40 to 50 pts | Very High |
|------------------|-----------|
| 30 to < 40 pts | High |
| 20 to < 30 pts | Medium |
| < 20 pts | Low |

Table 3 summarizes the Contaminant Risks for each category of drinking water contaminants.

Table 3. Contaminant Risks

| Category | Score | Rating |
|----------------------------|-------|-----------|
| Bacteria and Viruses | 45 | Very High |
| Nitrates and/or Nitrites | 46 | Very High |
| Volatile Organic Chemicals | 25 | Medium |

Finally, an overall vulnerability score is assigned for each water system by combining each of the contaminant risk scores with the natural susceptibility score:

Natural Susceptibility
$$(0-50 \text{ points})$$

+

Contaminant Risks (0 - 50 points)

=

Vulnerability of the Drinking Water Source to Contamination (0 - 100).

Again, rankings are assigned according to a point score:

Overall Vulnerability Ratings

| 80 to 100 pts | Very High |
|------------------|-----------|
| 60 to < 80 pts | High |
| 40 to < 60 pts | Medium |
| < 40 pts | Low |

Table 4 contains the overall vulnerability scores (0 - 100) and ratings for each of the three categories of drinking water contaminants. Note: scores are rounded off to the nearest five.

Table 4. Overall Vulnerability

| Category | Score | Rating |
|----------------------------|-------|--------|
| Bacteria and Viruses | 75 | High |
| Nitrates and Nitrites | 75 | High |
| Volatile Organic Chemicals | 55 | Medium |

Bacteria and Viruses

The contaminant risk for bacteria and viruses is **Very High** with with laundromats (without drycleaning); large-capacity septic systems; RV dump stations; single-family septic systems; paved highways and roads; and campgrounds and RV parks representing the risks to this source of public drinking water (See Chart 3 – Contaminant Risks for Bacteria and Viruses in Appendix D).

Only a small amount of bacteria and viruses are required to endanger public health. Recent sampling events indicated no recent positive results were detected for bacteria and viruses. However, after combining the contaminant risks with the overall natural susceptibility of the well, the vulnerability of the well to contamination by bacteria and viruses is **High**.

Nitrates and Nitrites

The contaminant risk for nitrates and nitrites is **Very High** with laundromats (without drycleaning); large-capacity septic systems; RV dump stations; single-family septic systems; paved highways and roads; and campgrounds and RV parks representing the risks to this source of public drinking water (See Chart 5 - Contaminant Risks for Nitrates and/or Nitrites in Appendix D).

Sampling history for The Tundra Lodge RV Campground indicates that nitrates have been detected in the water, but only in very low concentrations (most recently at 1.20 mg/L on 5/18/03) or 12% of the Maximum Contaminant Level (MCL). The MCL is the maximum level of contaminant that is allowed to exist in drinking water and still be consumed by humans without harmful health effects. Due to the high solubility and weak retention by soil, nitrates are very mobile, moving at approximately the same rate as water.

After combining the contaminant risk for nitrates and nitrites with the natural susceptibility of the well, the overall vulnerability of the well to contamination by nitrates and nitrites is **High**.

Volatile Organic Chemicals

The contaminant risk for volatile organic chemicals is **Medium** with car washes without engine or undercarriage cleaning; laundromats (without drycleaning); large-capacity septic systems; RV dump stations; single-family septic systems; aboveground heating oil tanks; paved highways and roads; and campgrounds and RV parks the only known risks for volatile organic chemicals (See Chart 7 – Contaminant Risks for Volatile Organic Chemicals in Appendix D).

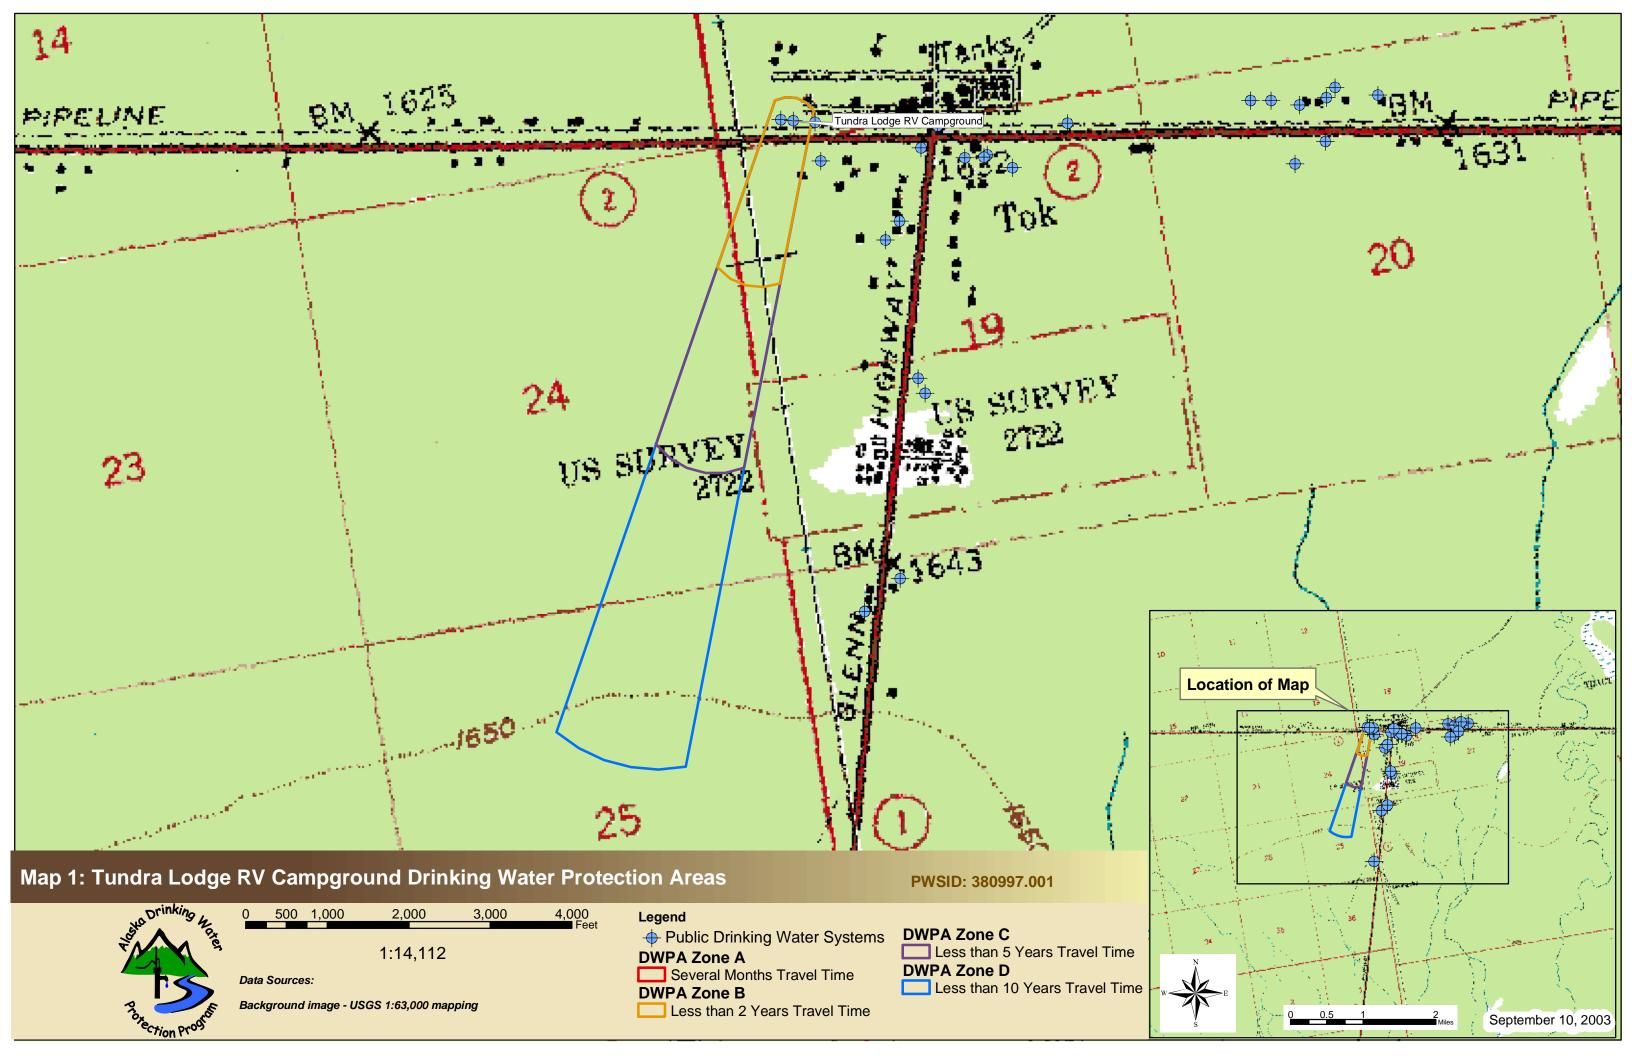

Sample data for volatile organic chemicals was not available. However, after combining the contaminant risk for volatile organic chemicals with the natural susceptibility of the well, the overall vulnerability of the well to contamination by volatile organic chemicals is **Medium**.
