Volume V, No. 2 Project Segment Report Federal Aid in Wildlife Restoration Project W-6-R-5, Work Plan K

The subject matter contained within these reports is often fragmentary in nature and the findings may not be conclusive; consequently, permission to publish the contents is withheld pending permission of the Department of Fish and Game. Additional biological information obtained during the period covered by these reports will be published at a later date in comprehensive form.

#### WORK PLAN SEGMENT REPORT FEDERAL AID IN WILDLIFE RESTORATION

STATE:	<u>Alaska</u>		
PROJECT NO .:	<u>W-6-R-5, 6</u>	TITLE:	Alaska Wildlife Investigations
WORK PLAN:	<u>K</u>	TITLE:	Game Harvest Statistics
PERIOD COVERED:	July 1, 1963	to Septe	ember 30, 1964

#### OBJECTIVES

To obtain and compile figures on the harvest of game animals in Alaska, so as to present a continuing record of such harvests. To develop and refine techniques for obtaining Statewide harvest data.

#### TECHNIQUES

The methods used to obtain harvest data included:

Harvest Tickets: Persons intending to hunt sheep and 1. moose obtained these tickets from license vendors without cost (vendors were paid 15 cents for each ticket issued). Upon taking a moose or sheep, hunters were required to attach one portion of the harvest ticket to the animal; the "report" portion was required to be completed and mailed within 15 days. Unsuccessful hunters were required to complete and mail the report portion of the ticket within 30 days of the last closing date of the season on the species in question. Overlay sheets, completed by vendors when the tickets were issued and then mailed to the Department, provided information on the number of hunters who obtained tickets, as well as names and addresses for the mailing of reminders to delinquent issuees. Sample tickets are shown in Figs. 1 and 2.

2. Sealing Certificates: Regulations requiring that bear, (brown-grizzly and polar) and beaver hides be sealed within 30 days of taking, or before being exported from the State, provide reasonably accurate data on the takes of these species. In the process of applying seals, the location and take, size of pelt, and other needed information is obtained. Sealing forms are shown in Figs. 3 and 4.

3. Fur export reports: These reports, available at post offices and common carrier offices, are required to be completed before the raw skins of wild fur animals may be exported from Alaska. A "permit" portion of a combined permit and report form is required to be attached to the outside of any package containing such raw furs. Almost all Alaskan furs (a few wolf and wolverine pelts being the main exceptions) are sent "outside" to be tanned, so the export reports, provided they are faithfully filled out and mailed, should provide accurate information on the State's fur harvest. The export and report form is shown in Fig. 5.

4. Fur dealer reports: All fur dealers are required to report on their purchases on the forms shown in Fig. 6. This information supplements the data obtained from fur export reports.

5. Bounty Reports: The Division of Protection periodically summarizes the information presented on affidavits submitted in connection with bounty claims. This provides data on magnitude and (to some degree) distribution of wolf, coyote, wolverine, and hair seal harvests. In 1963 and 1964 bounty claims were accepted on seals taken throughout the State in contrast to most previous years when the bounty applied only to those seals taken in specified parts of Alaska.

6. Certain hunts are conducted by registration or by permit. These allow accurate enumeration of the numbers of animals taken, for registrants and permittees are required to report, generally before leaving the hunt area or within a day or two afterwards. During the 1963-64 hunting season, a permit hunt was held on bison in the Delta Junction area.

7. The take by guided hunters was determined from analysis of mandatory guide reports.

Estimates based on general field observations, on checking station data, on voluntary reporting, close observation of confined harvests, or on interviews, provide harvest data on those species not reported on by one or more of the seven methods listed above. A mailed hunter survey questionnaire in 1961 and the close agreement of past estimates with information obtained through harvest tickets and other methods indicates that such estimates are reasonably accurate.

#### Total Harvest

Table 1 is a summary of 1963-64 hunting-trapping season harvest data. Although this report covers a period of 15 months in total, for any one species no more than 12 months harvest is given. (the period covered for each species is also shown in the table.)

Table 1. Game harvests in Alaska during the 1963-64 hunting and trapping seasons.

Cranes	176	wer

(No formal measurements or estimates of the 1963-64 small game harvest were made. It was reported that ptarmigan harvests were down considerably from immediately preceding years. The hunter survey questionnaire in 1961 provided the adjacent figures for small game harvests in that year: the figures were considered to be minimums because of the design of the survey. The relationship of

1963-64 harvests to the 1961 figures is unknown and the data are given for recording purposes only.

#### Comparative harvests:

Differences between harvest levels shown in Table 1 and those of immediately preceding years are for the most part not significant. Weather played its usual dominant role in influencing the take of many game species during the 1963-64 season, being particularly influential during that period in depressing the beaver take and the spring (1964) brown-grizzly bear and walrus harvests, while at the same time making possible an above-average take of polar bears. Comparisons of harvests among those species for which concrete comparative data are available, are shown in Table 2. Five seasons are shown except where concrete data are available only for shorter periods. As can be seen from the table, only the lynx harvest gives evidence of indicating a trend in population size.

SPECIES	1959-60	1960-61	1961-62	1962-63	1963-64

Table 2. Comparisons of some Alaskan game harvests for the years 1959-60 to 1963-64.

\*Because of recognized deficiencies in methods used to obtain harvest figures on these species, most data are rounded off to the nearest significant number.

 $^{1}$ Spring harvests in 1960, 1961, 1962, 1963, and 1964.  $^{2}$ Fall 1959 plus spring 1960, fall 1960 plus spring 1961, etc.

#### Distribution and composition of harvests

Concrete information on harvest distribution and composition is available only for a few of Alaska's many game species. Estimates, interviews, and survey projections can be considered fairly reliable on three species - deer, walrus, and caribou - and sealing, harvest ticket returns, and other means give accurate results on sheep, moose, brown-grizzly and polar bear, and beaver: accordingly, the distribution (and in some cases the composition) of the harvest of these species is given in Table 3. The sheep harvest, of course, is composed entirely of rams with three-quarter-curl or longer horns. Table 3. Distribution and composition of harvest of certain Alaskan game animals in 1963-64

\*

There are no moose in Units 2 and 4: the persons who reported on their harvest tickets that they took moose in these Units were obviously in error. Checking station data indicated that at least one moose was taken on Mitkof Island in Unit 3: whether the other animals reported on harvest tickets to have been taken in that Unit were actually taken there or whether misidentification of Unit by reporting hunters was involved here also is unknown.

## Table 3. (cont.)

#### Moose (cont.) Α.

1....

2. Sub-Unit areas (In addition to those few areas listed in this table, a fractioning of several other Units was initiated in 1963. Because of changes in these sub-units and the limited number of persons who would find the breakdowns of value, the data are not reproduced here: the information will appear in a forthcoming report on moose).

Unit 8	454	78.0	176	28.0	630	

The 1964 polar bear harvest of 251 animals consisted of 78 per cent males and 22 per cent females. Nonresident hunters, who took 56 per cent of the total, as usual selected males to a greater extent than did resident hunters, the nonresident take being composed of 89 per cent males compared to 61 per cent males in the harvest by residents.

The 1963-64 walrus harvest of 1,417 to 1,537 animals was about one-half of the total kill, the hunting loss as in the past being quite high. Table 3E shows the walrus harvest and hunting loss by area. The harvest was composed of 69 per cent bulls, 25 per cent cows, and 6 per cent calves.

Guided hunters from 41 states and twelve foreign countries took 1,110 head of big game in Alaska in calendar year 1963, according to guide reports. Table 4 shows where the 697 hunters came from.

The average number of hunters per guided party was 1.8, and the average number of big game animals taken per party was 2.9. The vast majority of guided hunters reached the hunting area by aircraft (300, of 512 whose mode of transportation was reported); a substantial number (91) traveled by boat, while 38 utilized wheeled vehicles, 35 went in by tracked vehicle, 47 used horses and one hunter used a snow sled.

The 382 parties guided in 1963 hunted in every month but December and January. August drew 111 parties, September 92: 55 parties hunted in May, 49 in April, 28 in March, 26 in October, 9 in November, 6 in June, and 3 each in July and February. Table 5 shows the number of hunters hunting each species of big game, and the total number of each species taken.

The distribution and composition of the harvest of big game by guided hunters are shown in Table 6.

During Calendar Year 1963 when the "guided hunter" statistics in Tables 4, 5, and 6 were compiled, nonresident hunters were required to hire guides to hunt brown-grizzly and polar bear, and sheep, goat, and walrus. Many nonresidents hunted other species, of course; also, the guide reports were not complete: the figures on license and tag sales given in Table 7 thus provide in some ways a better picture of the hunting effort by nonresidents. The table also provides a comparison of resident and nonresident license sales.
