October 12, 2001

1.0 INTRODUCTION

The purpose of this document is to report the results of activities conducted under URS's Alaska Department of Fish and Game Collection Permit No. SP-2001-099 (as amended) for collecting fish in select freshwater streams crossed by the Alaska Gas Producer's Pipeline Team's (AGPPT) Alaska Highway alignment. The primary objective of the fish steam crossing survey was to document and describe fish presence and relevant physical habitat characteristics for small to moderately-sized streams crossed by the proposed gas pipeline alignment with emphasis on the portion of the stream in the immediate vicinity of the crossing locations. This survey was conducted between July 7 and August 19, 2001.

The data collected under this field study could be used to support the preparation of resource reports for an application to the Federal Energy Regulatory Commission (FERC) for a certificate to construct the proposed gas pipeline project, if the proposed gas pipeline is determined to be economic. Fish presence and aquatic habitat information, in combination with hydrological and water quality information, will also be used to assist in the planning of pipeline design, construction techniques, and construction timing at specific crossing locations. Information regarding the presence and nature of fish resources and the sensitivity of their habitat is needed to define the permitting and mitigation requirements at each stream crossing. We understand that additional investigations will be required for necessary State of Alaska, Title 16 Permits to cross anadromous fish streams along the alignment.

2.0 METHODS

The proposed gas pipeline alignment along the Alaska Highway Route crosses or otherwise impacts about 538 streams, from Prudhoe Bay south to the Canadian border. While the aquatic resources of large rivers and streams are reasonably well known from data collected and compiled by the Alaska Department of Fish and Game, data for many of the numerous small and medium sized streams is limited. Through an initial screening process based on a review of the published and unpublished literature, data collected by resources agencies, and from other projects in the region, approximately 230-250 streams were considered to have insufficient data to meet the minimum requirement of the FERC Application. After the initiation of the field studies, we increased this number of streams by approximately 80 streams with an amendment to our permit in order to obtain current fisheries data on streams along the TAPS corridor.

2.1 Location Data

Coordinates for each crossing along the alignment were initially determined from a digital centerline overlaid on topographic maps and this provided the primary means of locating streams. In the field, stream crossings were located and documented using a GPS. The GPS unit used for all the field studies was Trimble Pro XRS (backpack) with the TSC-1 Data Logger. The data logger function allowed the integration of location data and site-specific survey data. Data entry into the GPS units was accomplished using menu options in order to maintain data consistency and insure complete collection of required data fields at each location. Base stations in several locations along the alignment were used to collect continuous data for post processing the GPS data collected in the field that resulted in an approximate accuracy of +/- 1 meter.

2.2 Physical Data

Once the field team arrived at a crossing location, an initial assessment of the crossing site was conducted. This involved collecting a standard suite of physical data and descriptive information. The data included basic water quality information (pH, dissolved oxygen, conductivity, temperature, and turbidity), average and maximum depth, average width, water velocity, estimated flow, cover characteristics, bank characteristics, riparian vegetation, substrate composition, habitat distribution, and channel type. This physical data is not included with this report because it is not required by the Permit Stipulations.

2.2 Fisheries Data

The field survey team consisted of four individual crews that could operate independently along the pipeline corridor. Each team consisted of a Crew Leader, an assistant fisheries biologist, water quality/GPS technician, and a bear guard.

The reaches of the streams near to the crossing location (50 meters upstream and 50 meters downstream) were sampled for fish using a variety of methods depending on the physical and biological characteristics of the stream. Methods available for fish sampling included a backpack, Smith-Root Model 7 electroshocker, beach seine, hook and line sampling and baited minnow-type traps. No electroshocking was conducted in streams with obvious spawning or migrating adult fish. If large fish were encountered, electrofishing activity was terminated incase they were spawners.

Because of the need to set minnow traps overnight, the use of traps was limited to special circumstances where repeat access was practical. The amount of effort expended in sampling at each stream was determined by the judgement of the team leader. The intent was to adequately characterize fish use within the sample reach.

Within small, wadeable streams, the entire 100-m reach was sampled with the electroshocker if practicable. All fish captured were identified to species, measured and released alive near the point of capture. Visual observations of fish were also recorded. If a stream was too deep for electroshocking, hook and line sampling was used or visual observations were conducted. In the larger streams or rivers where suitable information on fish is already available such as the Yukon, Chathanika, Salcha and Tanana Rivers, no active fish sampling was conducted although physical characteristics at the crossing location were collected.

A field estimation of habitat value for various fish species and life history stages was determined based on fish presence and physical characteristics. The team also recorded comments relative to special conditions, needs for mitigation, and potential for erosion. However this information is not include in this report because it is not required by the Permit Stipulations.

2.3 Logistics

Because of the large number of streams, long linear distance, and short time period, multiple investigation teams were used. Means of access to stream crossings was by foot. No helicopters or boats were used during the survey.

Accommodations for the mobile stream crews consisted of pickups and SUVs for transportation and travel trailers for lodging. Crews working in the vicinity of Fairbanks commuted to the stream locations from a base in Fairbanks.

3.0 RESULTS

A total of 376 streams or waterbodies crossing were sampled during the 2001 field season. The Alaska Department of Fish and Game has categorized sixteen of these streams as anadromous fish streams. Of the 376, eight streams were not sampled for fish due to deep water or suitable existing data such as the Yukon River. In these areas, only physical data was collected. Approximately six streams crossing along the alignment were not sampled this year because permission to access the sites was not obtained prior to the end of the field season. These crossing locations were either on private lands or on military reservations. In some cases data on these streams were collected at a different location (i.e. along the highway) in order to get some data on these streams.

Of the 376 waterbody crossings investigated, direct observations of fish presence were documented in 76 streams. This number of streams (76) is not meant to represent the total number of fish streams crossed by the alignment. Several more streams likely support fish at some time of the year but were dry at the time of sampling or they were not sampled due to deep water or dangerous sampling conditions. The larger streams likely have suitable historic information on fish use. Low water levels in July likely contributed to the lower than expected number or absence of fish in the smaller streams.

A total of ten species of fish was identified within the study area and these species are presented in the attached spreadsheet. All fish captured during the survey were released alive back into the streams. Arctic grayling were the most common and widely distributed species occurring in 65 of the 76 streams. The second most common fish was the slimy sculpin, which occurred in 23 streams. All other fish species occurred in no more than five streams.

Approximately 130 juvenile and adult Arctic grayling were captured during the survey and equally as many grayling fry were caught. One tagged grayling, was caught in a tributary to the Kuparuk River in mid-July. The tag number was yellow TOOLIK 04084. All grayling were released alive back into the stream.

Other species collected include Dolly Varden, burbot, ninespine stickleback, round whitefish, longnose suckers, and several unidentified fry. No salmon were captured during the survey but chinook salmon were visually observed in the Chatanika and Salcha Rivers.

A hard copy of the field data is attach to this report and an electronic copy of the fish stream data will be sent via email to ADF&G Area Biologists and the Gas Pipeline Office in Anchorage.

Report of Sampling Activity ADF&G Collection Permit
No. SP-2001-099
URS Job No. 74-NANGPG01.06

Dear Mr. Haven:

Please find enclosed our report of activities under our ADF&G Collection Permit No. SP-2001-099 for collecting fish in select streams crossed by the Alaska Gas Producer's Pipeline Team's (AGPPT) Alaska Highway alignment. The fish stream survey was conducted between July 7 to August 19, 2001 and sampling was conducted in 376 streams between Prudhoe Bay and the Canadian border. Fish were collected or observed in 76 streams.

A hard copy of the report including all fish data will be sent via Federal Express. Copies of this report will also be sent to ADF&G Area Management Biologists Mike Doxey and John Burr in Fairbanks and Fonty Parker in Delta Junction, Al Ott of the H&R Division in Fairbanks, and Mike Weidmer and Jonne Slemmons with the Gas Pipeline Office in Anchorage.

If you have any questions on this report, the data collected this summer, or any other aspect of the project, please feel free to contact me at 907 261-9750 or at 907 441-7931. Thank you again for your assistance on this project.

Sincerely,

David Erikson,
Senior Biologist

Legend and Notes

Value_Code	Data_Value	Value
A	Abundant	
C	Common	
F	Frequent	
NA	No Available Data	
NS	Not Sampled	
R	Rare	
U	Uncommon	1-5 fish per 100 meters
X	Not present	0

Fish Measurements

All lengths are in millimeters.
Each Asterix (*) represents an unmeasured fish.
Only Values in Bold were used

AGGPT Stream Reference Number

Sampling for streams with AGP reference numbers ending in "-A" were taken at locations other than the centerline of the proposed route, all of which were in the Delta Junction area where the proposed route crossed lands to which field teams had not yet received land owner permission to access. Sampling for streams with AGP reference numbers ending in "Rev13" were at locations from the Revision 13 alignments. The most current revision is Rev17.

Stream Names

Stream names taken form USGS Quad Maps, Alyeska Fish Stream Crossing Names(APSC Environmental Atlas, June 1993 edition), and descriptive names assigned by URS staff/surveyors for ease of identification.

TABLE 1 - SUMMARY OF FISH COLLECTION

Species	Total Number	Abundance	Number of Streams	Percent of Total
