

A guide to Alaska natural gas projects

Ideas for moving Prudhoe Bay's natural gas bounty off Alaska's North Slope are as plentiful as cottonwood seed in the June air.

Some are modest: Truck small amounts of gas to Fairbanks consumers.

Some are epic: Pipe massive amounts to Lower 48 consumers — the most expensive North American private — sector construction project ever, or ship liquefied natural gas to Asia.

Some are pinned to visions of an Alaska energy utopia, where gas for local use is plentiful and relatively cheap, the oil industry reawakens to develop new fields by the dozen, the state treasury overflows with wealth, and new industries sprout from the earth like wild lupine.

Some are backed by tens or even hundreds of millions of dollars to design, engineer and otherwise prepare for construction. These include the major pipeline through Canada and a much more modest pipeline to Southcentral Alaska.

Some are little more than a concept looking to catch on.

The great North Slope oil discoveries of the 1960s and 1970s also found an estimated 35 trillion cubic feet of natural gas — one and a half times the entire volume of U.S. production last year. The U.S. Geological Survey estimates an additional 221 trillion cubic feet await discovery in Alaska's Arctic, onshore and offshore. If only an economically viable way could be found to move the gas to consumers.

Below we summarize several proposals — big and small — for transporting natural gas from Alaska's North Slope.

LNG export project

This would involve an approximately 800-mile buried pipeline from the Prudhoe Bay field on Alaska's North Slope to Southcentral Alaska, possibly Valdez, possibly Nikiski or somewhere else closer to Anchorage. At the port, a plant would chill the gas to minus 260 degrees to create liquefied natural gas, or LNG, a compressed form of the gas that can be shipped on special tankers to markets worldwide.

The pipeline's size and route is undefined at this point, but similar proposals in the past involved piping 2 billion to 3 billion cubic feet of gas per day, with Alaskans using some along the way to the liquefaction plant and port.

Sponsors

Two separate groups are discussing such a pipeline.

ExxonMobil, ConocoPhillips and BP, the main North Slope producers, plus pipeline company TransCanada in March 2012 said they have begun looking into

Project Information

Sponsors: ExxonMobil/BP/ConocoPhillips/TransCanada; Alaska Gasline Port Authority

Estimated cost: \$43 billion to \$49 billion (depending on the project)

Route: Parallel the trans-Alaska oil pipeline from Prudhoe Bay to possibly Valdez, possibly Nikiski or somewhere else closer to Anchorage.

Gas for Alaskans: The oil companies/TransCanada project TransCanada/Exxon pipeline would provide at least five points in Alaska from which spur pipelines could be built, but since the project is being reevaluated, this could change; Port Authority says gas could be taken from the pipeline at Fairbanks and a spur line from Glennallen could provide gas to Southcentral.

Status: The oil companies/TransCanada Sponsors have committed to completing a serious assessment by Dec. 31, 2012, of the viability of an LNG export project; Port Authority has no discernible development at this time.

exporting LNG to Asia, where the gas currently can fetch a much higher price than in North America. They are in the very early stages of looking into this option. They hope to have a better idea of how this project might work by the end of 2012.

Two of the sponsors – ExxonMobil and TransCanada – in 2010 proposed to build a 48-inch buried pipeline to Valdez, with someone else constructing and operating an LNG plant there. They found insufficient interest at that time to pursue the project.

The Alaska Gasline Port Authority, founded in 1999, has proposed a government-owned Valdez LNG project. The port authority is a joint venture of the Fairbanks North Star Borough and Valdez, two local governments along the pipeline route. The port authority has no recent cost estimates for the project.

Source: BP

Estimated cost

\$43 billion to \$49 billion?

Pipeline: \$20 billion to \$26 billion (2009 dollars). This TransCanada/Exxon estimate for a pipeline to Valdez, and it includes \$11 billion for the Prudhoe Bay plant to remove water, carbon dioxide and other impurities from the gas, then compress it before it enters the pipeline. The pipeline would have carried 3 billion cubic feet of gas per day, delivering about 2.8 billion to the liquefaction plant.

LNG plant and Valdez port: \$23 billion? This figure is derived from a July 2011 study for the port authority. Tankers would cost \$200 million per ship, the study said.

A 2008 state of Alaska study estimated the liquefaction plant and port would cost \$10.8 billion to \$17.6 billion.

Gas for Alaskans

The pipeline concept pursued by the oil producers and TransCanada would provide at least five points from which spur lines could be built to provide gas to Alaskans. This project involves only providing gas takeoff points, not building the spur lines, which would be up to the state, utilities or private companies.

The port authority says gas could be taken from the pipeline at Fairbanks and that a spur line from Glennallen could provide gas to Southcentral Alaska.

Status

The North Slope producers and TransCanada have begun to explore the feasibility of an LNG project. The state says the sponsors have committed to completing a serious assessment by Dec. 31, 2012, of interest among producers, explorers, LNG terminal developers and others in the possible export project. Under terms of the state's Alaska Gasline Inducement Act license issued to TransCanada in 2008, the state will reimburse the companies for 90 percent of their early development work on the new LNG option.

The port authority continues to tout the LNG export idea in speeches, op-ed columns and interviews.

Pluses

- Short-term economic boost to Alaska during construction.
- With the right project economics, long-term boost as billions of dollars in revenue flows to state treasury, the Alaska Permanent Fund and local governments along the pipeline route.
- Southcentral Alaska gets new industry based on LNG export.
- Outlet for natural gas now stranded on Alaska's North Slope should spur oil and gas exploration there.
- Relatively inexpensive gas made available for heating and power generation in the Fairbanks area.

- For Southcentral Alaska, the project likely provides an affordable source of new natural gas to supplement Cook Inlet supplies.

Minuses

- A very expensive option. High cost makes project risky for lenders that would supply construction financing.
- Federal loan guarantees are available only for a pipeline project that delivers gas to the Lower 48, not projects that would export gas. Lack of federal backing would raise project costs.
- Buyers needed immediately for huge output from LNG plant, with little ramping up of project over time.
- Shippers must commit gas to pipeline for 20-plus years and find long-term buyers for the LNG in a Pacific LNG market that other exporters are targeting.
- Fairbanks area energy costs remain relatively high until pipeline is running.
- Southcentral Alaska could need supplemental source of natural gas before pipeline is finished.

The pipeline would move up to 4.5 billion cubic feet of gas per day.

The project includes a 58-mile pipeline to Prudhoe Bay from the Point Thomson gas field.

Sponsor

TransCanada and ExxonMobil, also known as the Alaska Pipeline Project.

Estimated cost

\$32 billion to \$41 billion (2009 dollars).

The cost includes a \$12 billion gas treatment plant at the Prudhoe Bay field to remove water, carbon dioxide and other impurities from the gas, then compress the raw gas before it enters the pipeline.

Gas for Alaskans

The pipeline would provide at least five points in Alaska from which spur lines could be built to provide gas to Alaskans. The APP project involves only providing gas takeoff points, not construction of the spur lines, which would be up to the state, utilities or private companies.

Status

On hold, waiting for North American natural gas prices to rise.

The Alaska Pipeline Project spent over \$300 million from the project onset through 2011. The sponsors put the project on hold during spring 2012. Under the Alaska Gasline Inducement Act, the state plans to reimburse the sponsor for up to \$500 million of its pre-construction costs. With TransCanada and ExxonMobil now involved in considering LNG exports, state reimbursements have shifted to certain costs associated with that project.

In January 2012, the sponsors filed with the Federal Energy Regulatory Commission volumes of data on fish, wildlife, soils, vegetation, cultural sites, air quality and other information that can be used for the environmental impact statement FERC would prepare. Much of that data also could be used for an EIS on a pipeline for an LNG project, because some of the route in Alaska would be same as the route for an Alberta line.

The sponsor held an "open season" in 2010 at which it solicited pipeline customers. On May 3, 2012, Alaska

Pipeline to Alberta

This involves an approximately 1,700-mile, 48-inch buried pipeline from the Prudhoe Bay field on Alaska's North Slope to the British Columbia-Alberta border in Canada. From there, the gas could flow to the Lower 48 via an extensive network of existing pipelines.

The gas line would parallel the trans-Alaska oil pipeline from Prudhoe Bay to Delta Junction, then continue into Canada roughly parallel to the Alaska Highway.

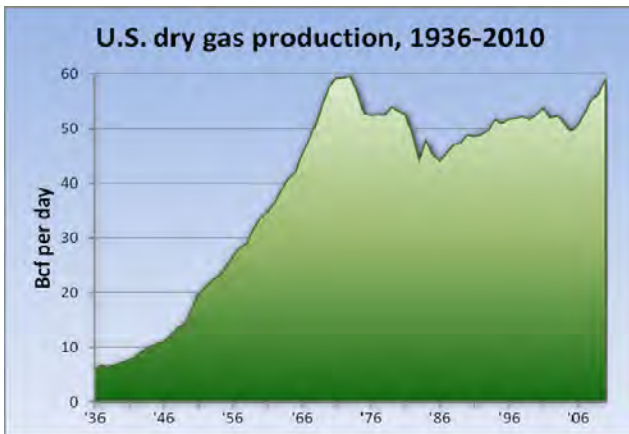

Project Information
Sponsor: TransCanada/ExxonMobil (the Alaska Pipeline Project)
Estimated cost: \$32 billion to \$41 billion (2009 dollars)
Route: Parallel the trans-Alaska oil pipeline from Prudhoe Bay to Delta Junction, then continue into Canada roughly parallel to the Alaska Highway
Gas for Alaskans: Minimum of 5 take-off points available in Alaska
Status: Preparing application to the Federal Energy Regulatory Commission

Pipeline Project officials filed with FERC to formally end their open season efforts, noting, “(P)roducers expressed significant interest in the Alberta Project in the form of conditioned bids for capacity on that pipeline.” Unsuccessful negotiations ensued.

The sponsor needed commitments for much of its pipeline's capacity to obtain construction financing.

Proposed timeline

Under an agreement with the state, TransCanada and ExxonMobil have until October 2014 to apply to FERC for a certificate to build and operate the pipeline. This is a two-year postponement from a previous deadline. A FERC review of the application would take just under two years, with pipeline construction likely taking another five to six years.

Source: U.S. Energy Information Administration

Pluses

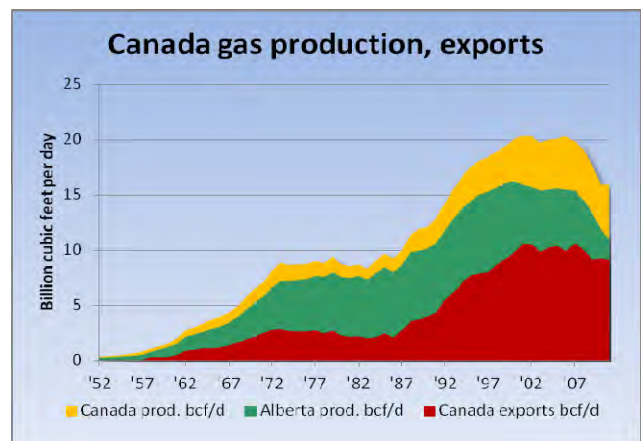

- Short-term economic boost to Alaska during construction. Estimated 8,000 to 10,000 jobs during peak construction.
- Likely long-term economic boost as billions of dollars in revenue flows to state treasury, the Alaska Permanent Fund and local governments along the pipeline route.
- Outlet for natural gas now stranded on Alaska's North Slope should spur oil and gas exploration, finding new crude for the trans-Alaska oil pipeline and extra gas for a gas pipeline.
- With a spur line, consumers in Alaska's Railbelt could be assured of an affordable supply of gas for decades. The project could supplement Cook Inlet supplies in Southcentral Alaska. For the Fairbanks

area, relatively inexpensive gas would ease high energy prices for heating and power generation.

- The project might give rise to two industries in Southcentral Alaska, one that exports natural gas liquids and another that exports liquefied natural gas.
- About half of the construction cost could be backed by federal loan guarantees; federal tax breaks are available for pipeline and gas treatment plant.

Minuses

- High cost makes project risky for lenders that would supply construction financing.
- Requires major gas shippers — likely the North Slope producers — to commit to using the pipeline for at least 20 years.
- Not knowing what natural gas market prices will be over that long time horizon makes the project extremely risky for gas shippers. Low prices could shrink or eliminate their profits.
- North Slope producers want state of Alaska to set stable fiscal terms for gas production and the pipeline.
- Fairbanks area energy costs remain relatively high until natural gas is flowing. Pipeline might not be running before Southcentral Alaska needs supplemental source of natural gas.

Sources: Canadian Assn. of Petroleum Producers; U.S. Energy Information Admin.

Pipeline to Southcentral

A 737-mile, 24-inch buried pipeline from the Prudhoe Bay field on Alaska's North Slope to the Big Lake area of Southcentral Alaska. From there, the gas could flow to consumers, utilities and other industry via the local distribution pipelines of ENSTAR Natural Gas Co. Pipeline also would supply Fairbanks area.

Project Information
Sponsor: Alaska Gasline Development Corp.
Estimated cost: \$5.3 billion to \$9.8 billion (2011 dollars)
Route: Parallel the trans-Alaska oil pipeline from Prudhoe Bay to just north of Fairbanks, then continue south to Big Lake, roughly parallel to the Parks Highway
Gas for Alaskans: That is the main purpose of this proposal. Pipeline would supply Fairbanks, Southcentral.
Status: Preliminary planning

The pipeline would parallel the trans-Alaska oil pipeline from Prudhoe Bay to just north of Fairbanks, then continue south to Big Lake, roughly parallel to the Parks Highway.

The pipeline would move up to 500 million cubic feet of gas per day. The project also is known as the "bullet line," the in-state line and the Alaska Stand Alone Pipeline, or ASAP.

Sponsor

Alaska Gasline Development Corp., a state agency the Legislature created in 2010.

Estimated cost

\$5.3 billion to \$9.8 billion (2011 dollars). Sponsor is using midpoint of \$7.52 billion as a working number.

The cost includes a \$1.84 billion gas treatment plant at the Prudhoe Bay field to remove water, carbon dioxide and other impurities from the gas, then compress the raw gas before it enters the pipeline.

Project cost does not include a separate 35-mile spur line as well as local gas distribution network needed for Fairbanks. A local gas pipeline network already exists in Southcentral.

Gas for Alaskans

Gas for Alaskans was the main idea for this project when the state Legislature funded a feasibility study in 2010.

Status

Project is in its very early stages. Feasibility study issued in July 2011 provided a preliminary plan, and the sponsor recommends the state spend \$370 million to firm up the design, cost estimates and engineering, acquire permits and seek customers that would ship gas through the pipeline. The Alaska Legislature in 2012 provided some funding for pre-construction work to continue.

Proposed timeline

2011-2015 — Project sponsor sharpens engineering and cost estimate, obtains permits, solicits customers.

2015-2018 — Construction and commissioning.

2018-2019 — First gas flows.

Pluses

- Short-term economic boost to Alaska during construction of multibillion-dollar project.
- The project could deliver gas to Fairbanks and Southcentral before a larger pipeline to an LNG plant in Southcentral Alaska or to Alberta.
- Consumers in Alaska's Railbelt could be assured of an affordable supply of gas for decades. In Southcentral Alaska, the gas could supplement Cook Inlet supplies used for heating and power generation. Delivering natural gas to Fairbanks could greatly lower that community's high cost of energy.
- The project might give rise to new industries in Southcentral Alaska, one that exports natural gas liquids and another that exports liquefied natural gas.

Minuses

- Likely requires state to issue billions of dollars in revenue bonds.
- The cost estimate is soft. A much higher cost than the midpoint \$7.52 billion estimate would alter the project economics.
- Requires major gas shippers to make long-term commitments to use the pipeline.

- The project would produce far less new state revenue than a larger pipeline for an LNG export project due to the small volume of gas moved and the state's tax structure.
- Requires the state to bear all of the pre-construction cost because no private developer will do so.
- Project sponsor wants state law to exempt the pipeline's shipping charges, or tariffs, from regulation.
- The cost of gas to Alaskans would be higher than gas from the LNG export project or pipeline to Alberta.
- The project would not spark as much Arctic oil and gas exploration as the bigger pipeline.
- The project relies on a chain of assumptions about demand for gas that must come true to make the gas as affordable to Alaskans as predicted. These assumptions include:
 - 1) A revived liquefied natural gas export plant will take almost half of the daily gas flow.
 - 2) A separate business will invest nearly \$1 billion to build a plant in the Matanuska-Susitna Borough to take propane and butane from the gas stream, process them and find buyers for them inside or outside Alaska.
 - 3) A major mine, such as the Donlin gold prospect in Western Alaska, will start up by 2019 and consume 6 percent of the daily gas flow.
 - 4) A utility or utilities will build a spur line and a local gas distribution pipeline network in Fairbanks by the time the pipeline from Prudhoe Bay is ready.
 - 5) Cook Inlet gas production will fall to such a point that power plants and the local gas utility in Southcentral Alaska will consume about 20 percent of the pipeline's gas.

Cook Inlet gas exploration

In June 2011, the U.S. Geological Survey estimated the Cook Inlet region still holds an estimated 19 trillion cubic feet of natural gas that could be produced using current technology.

That's more than double the total Cook Inlet gas production over the past 50 years.

But how much of the gas could be produced *profitably* with current technology likely is a much smaller number, possibly as little as 10 percent.

Separately in June, the Alaska Division of Oil and Gas estimated that Cook Inlet alone could continue to profitably supply all of the region's natural gas needs until 2018-2020, at which time supplemental supplies would be needed. The study said the gas industry must continue investing in the Inlet for this prediction to hold.

The state Legislature over several years has created a package of incentives to boost Cook Inlet gas production.

A key incentive offers up to \$25 million in tax credits for the first exploration well drilled from a jack-up rig, up to \$22.5 million for the second well drilled by a different company and up to \$20 million for a third well by a third producer.

At least two companies are pursuing those incentives. Furie Operating Alaska LLC moved a jack-up rig to Cook Inlet and started drilling in late summer 2011, hoping to complete a drilling program in 2012. Buccaneer Energy hopes to bring in a jack-up rig, partly financed with state money, in 2012.

Another state incentive provides a 20 percent to 65 percent tax credit for oil and gas exploration or development capital spending, in Cook Inlet or elsewhere in Alaska.

Project Information

Sponsor: Various drilling companies

Estimated cost: Unknown

Route: Gas from Cook Inlet is transported within the Southcentral region by pipeline.

Gas for Alaskans: This plan would service the Southcentral region. LNG exports are possible.

Status: Currently being pursued by several companies

Importing LNG

In 2011, three Anchorage utilities joined to consider the idea of importing liquefied natural gas to Southcentral Alaska.

ENSTAR Natural Gas Co. supplies gas for residential and business furnaces, and Chugach Electric Association and Municipal Light & Power burn gas to make electricity.

They estimate Cook Inlet fields might not produce enough gas by 2015 to fulfill their needs. The supply gap would start small but grow to as much as 140 million cubic feet a day on average by 2020, they told state utility regulators in June 2011. Their idea is that an import project should be scalable so that more gas could come in as the utilities' needs grow.

Since then, the USGS and Alaska Division of Oil and Gas have issued rosier projections of Cook Inlet's potential gas supply. But the utilities still think they'll likely need LNG supplies before new discoveries are producing or a pipeline is built.

The utilities continue to explore the cost, design, location, volumes needed, potential suppliers, regulatory issues and other aspects of opening an LNG import plant. While the USGS and state say there's a high probability that Cook Inlet's gas prospects are better than previously thought, that's short of the certainty of supply the utilities need.

Gas to Fairbanks by truck or pipe

Three ideas have been floated for getting North Slope natural gas to the Fairbanks area, where energy costs are much higher than in Southcentral Alaska.

Project Information
Advocates: Various utilities
Estimated cost: Unknown
Route: LNG would be brought by tankers to Southcentral for regasification and regional use.
Gas for Alaskans: This would be a stop-gap measure to ensure that Anchorage area has enough gas.
Status: No specific plans have been presented at this time.

LNG trucked to Golden Valley Electric and the Flint Hills refinery

In August 2011, Golden Valley Electric Association and Flint Hills Resources announced a project to buy North Slope gas, superchill it to make LNG and truck it about 500 miles to North Pole.

The two partners pegged the cost at \$200 million, including an LNG plant, about 40 trucks, storage, plus a plant to regasify the LNG in North Pole. Startup would be early 2014. They said engineering has begun but the project is in its very early stages of development.

Both companies said they would use the gas — about 20 million cubic feet a day on average — to replace more expensive fuels. Golden Valley would burn the gas at its North Pole power plant and save an estimated \$1 million a month in fuel costs. Flint Hills would burn gas at its North Pole oil refinery.

Fairbanks community leaders said some extra gas could be sold elsewhere in the Fairbanks area. Brian Newton, CEO of Golden Valley, said in late September that the volume trucked could grow. Since August, he said, nine other potential gas users in the area have approached the partnership about getting gas from the trucked LNG.

In 2012, the Alaska Legislature passed measures to help this project along. It provided \$3.75 million to Golden Valley for engineering and design of an LNG facility and \$15 million in state payments or tax credits to businesses that create LNG storage facilities.

Trucked LNG by Fairbanks Natural Gas LLC

Fairbanks Natural Gas also has a plan to truck North Slope LNG to Fairbanks.

The company, a subsidiary of Minnesota-based Pentex Alaska Natural Gas, has been liquefying Cook Inlet gas and trucking it to Fairbanks since 1998. Last year it posted a \$3 million profit on \$16.1 million in gas

Project Information
Sponsor: Golden Valley Electric Association and Flint Hills Resources
Estimated cost: \$200 million
Route: Trucks would transport the LNG down the Dalton Highway from Prudhoe Bay and then to North Pole, Alaska.
Gas for Alaskans: This project would bring gas only to the Fairbanks area.
Status: Currently engineering the project, but in very early stages

operating revenue, according to filings with state utility regulators.

Fairbanks Natural Gas has contracted for Cook Inlet gas supplies into mid-2013. But with overall Cook Inlet output falling, several years ago a Fairbanks Natural Gas affiliate, Polar LNG, contracted with ExxonMobil to buy gas from the oil company's Prudhoe Bay production. In 2009, it leased state land near Prudhoe Bay as a site for an LNG plant.

The LNG plant hasn't been built yet. With Golden Valley and Flint Hills pursuing their own trucked LNG idea, Fairbanks Natural Gas may have lost two potential major customers. It's unclear what happens next to its trucked LNG project.

In August 2011, the Alaska Gasline Port Authority dropped its idea to buy Fairbanks Natural Gas to take over its trucked North Slope LNG proposal.

Piped natural gas to Fairbanks

Fairbanks Pipeline Co. started in 2010 and is proposing a Prudhoe Bay-to-North Pole pipeline to deliver natural gas to Interior Alaska customers. Fairbanks Pipeline is owned by Energia Cura, a Fairbanks energy consulting and service business.

Project Information
Sponsor: Fairbanks Pipeline Company (Energia Cura)
Estimated cost: \$709 - 716 million
Route: Prudhoe Bay to the Fairbanks area following state highways
Gas for Alaskans: This project would bring gas to the Fairbanks area, but sponsor would consider handling extra gas for Southcentral.
Status: Planning stages

The company said it is targeting Golden Valley Electric, military bases, trans-Alaska pipeline pump stations and mines, as well as Fairbanks Natural Gas, the small local gas utility. It has estimated the 514-mile, 12-inch buried pipeline would cost \$709 million to \$716 million, but the company now believes the cost will be lower after hearing from steel mills that could supply the pipe. The route would follow state highways. The Energia owners are funding development costs, the company website says. They hope others, including the state, possibly through its Permanent Fund savings account, become owners.

Fairbanks Pipeline held an open season soliciting customer interest during the third-quarter of 2010 and said it got non-binding interest for 32 million cubic feet of gas a day as of 2014, ramping up to 52 million in 2019. Gas buyers would pay \$9.66 per thousand cubic feet, under the plan. The company also is considering a larger, 18-inch pipeline project that, besides serving Interior Alaska markets, also would deliver about 200 million cubic feet a day to Southcentral.

Project Information
Sponsor: Fairbanks Natural Gas, a division of Pentex Alaska Natural Gas
Estimated cost: Unknown
Route: Trucks would transport the LNG down the Dalton Highway from Prudhoe Bay and then to Fairbanks.
Gas for Alaskans: This project would bring gas only to the Fairbanks area.
Status: No discernible development at this time
