REVISION O

MAY 1984

NOTICE

ANY QUESTIONS OR COMMENTS CONCERNING THIS REPORT SHOULD BE DERECTED TO THE ALASKA POWER AUTHORITY SUSITNA PROJECT OFFICE This document provides an overview of potential impacts of the Susitna Hydroelectric Project on wildlife and botanical resources of the project area, and indicates the status of planning to mitigate those impacts. The purpose is to provide a working record of impact assessment and mitigation planning in the form of a summary that is updated periodically. During the course of major energy development projects, the tracking of environmental concerns from impact assessment through mitigation proposals and subsequent action can become a cumbersome process. The following summary is organized in matrix format to ease this process and to provide quick reference to current impact and mitigation reasoning. This record is presented to encourage input by all interested parties and to inform decision-makers of the current state of thought concerning relevant resource issues.

Much of the information contained in the matrix was summarized from Exhibit E of the project license application to the Federal Energy Regulatory Commission (FERC). Descriptions of ongoing and planned studies were obtained from the Alaska Power Authority's Fiscal Year 1984 and Fiscal Year 1985 plans of study for terrestrial programs. Most of the potential impact mechanisms listed in the matrix were defined by project biologists on the basi's of studies sponsored since 1981 by the Alaska Power Authority. Other impact mechanisms suggested by resource agencies are also listed. Although they have received attention, the inclusion of these additional hypotheses does not imply that they are based on results of studies by project biologists, or that the conjectured mechanisms will produce significant impacts.

A potential impact mechanism is considered to be significant if, in the judgment of project biologists, that mechanism is likely to produce an observable and persistent change, beyond natural cyclic fluctuations, in the number or distribution of individuals of a particular species (or group of species) in the Susitna project area as a result of project construction and/or operation. About 22 percent of the impact mechanisms listed in the matrix are currently considered to be in this category. For most of these, sufficient information already exists to support ongoing mitigation planning, and additional studies are not necessary. The remaining potentially significant but unresolved mechanisms are receiving further study, and the list of topics requiring such study is shortening as results accrue. About 78 percent of the potential impact mechanisms listed in the matrix are marked with an asterisk. This indicates that they are not considered to be significant and will not be subject to further studies or mitigation planning beyond standard engineering practice and, in some cases, field monitoring. Future revisions of this tracking system will provide an updated record of potential impact mechanisms that are, or are not, considered to significant by the Alaska Power Authority.

The matrix is organized to show for each type of potential impact the current assessment status, ongoing or planned studies, monitoring plans, and mitigation plans that are relevant to that impact. The major column headings describe the steps in the planning process as follows:

- Affected Species or Group: lists each species or group of species of concern in the project area and surrounding region.
- II) Impact Mechanism: briefly explains how various aspects of the project might affect each listed species or group.*
- III) Impact Assessment Status: provides an evaluation of the potential impact, including its perceived importance to the affected species or group and any quantification of the impact that has been developed.
- IV) Ongoing and Planned Studies: provides a summary of investigations that are in progress or planned for the near future and that are relevant to refining the particular impact assessment or mitigation plan.
- V) Proposed Monitoring: summarizes field monitoring programs that are proposed to be conducted during project construction and operation to document impacts and to assist in mitigating them.
- VI) Proposed Mitigation Measures: summarizes measures that have been proposed to assist in mitigating the effects of the pertinent impact mechanism.
- * Indicates that the potential impact mechanism is not likely to be significant and does not warrant further study or mitigation planning beyond standard engineering practice and, in some cases, field monitoring.

Each cell of the matrix can be uniquely identified by column (vertical) and row (horizontal). To identify a particular cell, it should be cited first by the <u>Affected Species or Group</u> letter; second, by the <u>Impact</u> <u>Mechanism</u> number; and third, by column heading III, IV, V, or VI. For example, the cell on page 1 describing proposed measures to mitigate permanent loss of moose habitat due to the impoundments and other permanent facilities would be cited as Al/VI. This format provides a shorthand notation intended to allow specific topics within the matrix to be cited quickly and precisely in communications concerning impact assessment and mitigation topics.

A reference section is provided at the end of this document. It explains that, to save space, citations in the matrix differ from standard citation formats typically used in reports. Successive revisions of the matrix will include an increasing number of citations; the goal is to provide document and page references for all project-related reports and other project communications in which a particular impact mechanism, impact assessment, existing or proposed study, proposed monitoring program, or proposed mitigation plan is discussed.

The information contained in the present revision (Revision 0) of this document represents the status of impact assessment and mitigation planning in the spring of 1984. Ongoing studies sponsored by the Alaska Power Authority are continuing to provide new and updated information pertinent to the evaluation of potential impacts. Revision 1 and subsequent revisions of this document will include information provided by these studies and by impact assessment and mitigation planning refinement reports, in some cases altering the conclusions contained in Revision 0.

(I) Affected Species or Group	(II) Impact Mechanism	(III) Impact Assessment Status	(IV) Ongoing and Planned Studies	(V) Proposed Monitoring	(VI) Proposed Mitigation Measures
(A) Moose	(7) Habitat improvement will occur along the transmission line corridor due to maintenance of vegetation at early successional stages.	The transmission corridors - will provide up to 78,100 acres of winter habitat of reasonable quality (p. E-3-529; Table E.3.145). Represents a beneficial impact on moose.	A literature review of habi- tat enhancement techniques is underway (FY84 Task 4.1.11) and field studies of disturbed areas are planned (FY85 Task 14).		Selective clearing in transmission corridor, permitting seral vege- tation up to 10 ft in height (p. E-3-526 #4).
	* (8) Drifting snow from the impoundment surface may preclude use of a narrow band of winter browse along the impoundment shore.	Snow drifts are unlikely to extend more than 100-200 yds into wooded habitats. The drawdown zone and ice shelves will catch much windblown snow. The value of the Fog Lakes area will be unaffected (Table E.3.145).	Assessment of snow drifting impacts will be addressed during impact assessment refinement (FY84 Task 3.1.3; FY85 Task 5).		Habitat enhancement measures in middle basin and on replace- ment lands to com- pensate for permanent habitat loss (p. E-3-527 #6).
	*(9) Drifting snow in the transmission line corridor may preclude use of winter browse.	Impact not quantified but not expected to be signi- ficant (Table E.3.145).	Assessment of snow drifting impacts will be addressed during impact assessment refinement (FY84 Task 3.1.3; FY85 Task 5).		Selective clearing in the transmission corri- dor, permitting seral vegetation up to 10 ft in height (p. E-3-526 #4).
					Habitat enhancement measures in middle basin and on replace- ment lands to com- pensate for permanent habitat loss (p. E-3-527 #6).
					Minimize loss of forest areas through alignment of access road and transmission corridor, and other measures (p. E-3-539 #23).
	*(10) Delayed melting of snow drifts in a narrow band along both impoundment shores and the transmission corridor may reduce availability of spring forage.	Availability will be de- layed in this zone but forage will eventually become usable as the spring thaw progresses. Actual area of early spring forage that may be affected will be a narrow band (100-200 yds) confined along the impoundment shore. Impacts are not expected to be significant (Table E.3.145).	Assessment of snow drifting impacts will be addressed during impact assessment refinement (FY84 Task 3.1.3; FY85 Task 5).	Document browse production on lands enhanced for moose browse (p. E-3-525 #11).	Habitat enhancement measures in middle basin and on re- placement lands to compensate for per- manent habitat loss (p. E-3-527 #6).

(I) Affec Specie Grou) sted s or up	(II) Impact Mechanism	(III) Impact Assessment Status	(IV) Ongoing and Planned Studies	(V) Proposed Monitoring	(VI) Proposed Mitigation Measures
(A) M	loose	*(11) Climatic changes due to the impoundments (e.g., increased summer rainfall, increased winds, cooler sum- mer temperatures, increased early-winter snowfall, and hoar frost deposition) may reduce habitat carrying capa- city (p. E-3-406). Delayed plant phenology may occur immediately adjacent to the reservoir due to its cooling effect, reducing spring forage for moose, and pos- sibly causing some changes in plant composition (p. E-3-400).	Available data from Wil- liston Reservoir, B.C., indicate that these subtle climatic effects will likely be undetectable and of little impact on moose habitats (Table E.3.145). Impact would be influenced by the reservoir width and prevailing wind direction in spring.	1983 plant phenology study will document physical and environmental variables affecting availability and development of early spring forage (FY84 Task 4.1.4). Impacts of local climate changes will be addressed during impact assessment refinement (FY84 Task 3.1.3; FY85 Task 5).	Document browse production on lands enhanced for moose browse (p. E-3-525 #11).	Habitat enhancement measures in middle basin and on re- placement lands to compensate for perma- nent habitat loss (p. E-3-527 #6). Development of moose- habitat model to yield better impact predictions and refinements to miti- gation and compensa- tion measures (p. E-3-530 #7).
		<pre>* (12) Altered plant phenology due to open and warmer water may affect moose spring forage and cover in downstream areas.</pre>	Impact not quantified but not expected to be signifi- cant.	Impact severity not suffi- cient to require study.	Collect data on changes in downstream vegetative cover (p. E-3-523 #2).	Use of multilevel intake structures on the dams to maintain downstream river tem- peratures as close to normal as possible (p. E-3-526 #5).
		*(13) Vegetation icing (hoar frost) downstream may render some browse unavailable, and metabolic demands of moose may increase.	Impact not quantified but not expected to be signi- ficant (Table E.3.145). Icing (hoar frost) will likely be heaviest within the steep canyon and may not preclude use of browse by moose. Impacts of increased metabolism for moose eating hoar frost would be difficult to detect (p. E-3-408).	Assessment of ice accumula- tion on downstream vege- tation is being refined during impact assessment refinement (FY84 Task 3.1.3; FY85 Task 5).	Collect data on changes in downstream vegetative cover (p. E-3-523 #2).	Use of multilevel intake structures on the dams to maintain downstream river temperatures as close to normal as possible (p. E-3-526 #5).
		(14) Alteration of downstream habitats will occur due to altered seasonal and annual river flow regimes.	Impact not quantified. Reduced size of river islands, loss of fertili- zation effects of spring flooding, and loss of some early successional habitats (particularly early seral stages domi- nated by willow) may lower habitat values for moose (p. E-3-408). See impact category (R)(12).	Refinement of downstream vegetation impact assess- ment to better assess ef- fects on moose habitat will continue (FY84 Task 4.2.4; FY85 Tasks 5, 15, and 23).	Collect data on changes in downstream vegetative cover (p. E-3-523 #2).	Use of multilevel intake structures on the dams to maintain downstream river temperatures as close to normal as possible (p. E-3-526 #5). Habitat enhancement measures in middle basin and on re- placement lands to compensate for per- manent habitat loss (p. E-3-527 #6).

(I) Affected Species or Group	(II) Impact Mechanism	(III) Impact Assessment Status	(IV) Ongoing and Planned Studies	(V) Proposed Monitoring	(VI) Proposed Mitigation Measures
(A) Moose	* (15) Open water and/or ice shelving in the impoundments may block access to traditional calving and wintering areas.	Some moose may not cross the impoundment due to ice blockage and visual barrier effects. Moose will probably alter seasonal movements and crossings to maximize use of surrounding browse and forage supplies (p. E-3-410). Not expected to be significant.	This impact mechanism will receive further attention during impact assessment refinement (FY84 Task 3.1.3; FY85 Task 5).	Collect records of impound- ment crossings and impoundment-caused mortality during open-water period (p. E-3-524 #4).	Clearing of impound- ments prior to flooding and removal of floating debris to reduce hazards to crossing (p. E-3-530 #9).
	*(16) Ice shelving or floating debris may cause direct mortality to moose attempting to cross the impoundment.	Impact not quantified but not expected to be signifi- cant (Table E.3.145).	This impact mechanism will receive further attention during impact assessment refinement (FY84 Task 3.1.3; FY85 Task 5).	Collect records of impound- ment crossings and impound- ment-caused mortality during open-water period (p. E-3-524 #4).	Clearing of impound- ments prior to flood- ing and removal of floating debris to reduce hazards to crossing (p. E-3- 530 #9).
	*(17) Prior to filling, clear- cut areas in the impoundment may inhibit movements due to slash piles and human dis- turbance.	Noisy and unpredictable activities will probably cause avoidance of the area and extend the range of effective habitat loss during clearing beyond the mechanically disturbed area (Table E.3.145).	Impact severity of this disturbance is not suffi- cient to require study.		Impoundment clearing will not begin until 2 or 3 years before filling; patches of vegetation will be left until just before filling (p. E-3-525 #1).
		•			Major ground activity will be prohibited near sensitive wild- life areas during sensitive periods (p. E-3-532 #10).
	*(18) Snow drifts may impede movements south and southwest of the reservoir and reduce the value of the Fog Lakes area as winter range.	Snow drifts are unlikely to extend more than 100-200 yds into wooded habitats. The drawdown zone and ice shelves will catch much windblown snow. The value of the Fog lakes area will be unaffected. Impact not expected to be signifi- cant (Table E.3.145).	Impact assessment refinement will address this impact (FY84 Task 3.1.3; FY85 Task 5).		
	*(19) Increase in mortality due to train and automobile collisions caused by increase in traffic levels.	Impact not quantified, likely to be most severe during construction phases (Table E.3.145).	Impact will be addressed through impact assessment refinement (FY84 Task 3.1.3; FY85 Task 5).	Collect mortality data on road and railroad collisions (p. E-3-523 #1).	Possible controls on volume, speed and frequency of access road traffic (p. E-3-534 #12).

(I) Affected Species or Group	(II) Impact Mechanism	(III) Impact Assessment Status	(IV) Ongoing and Planned Studies	(V) Proposed Monitoring	(VI) Proposed Mitigation Measures
(A) Moose	* (20) Open water downstream may restrict movements across the river and to island wintering areas (as far downstream as Gold Creek [Watana only] and Talkeetna [both dams]). Attempted crossings of open river areas in winter may lead to mortality.	Moose are unlikely to cross open water in winter (most crossings were from May to November [p. E-3-409]). Impact not quantified, but effects on moose survival would be difficult to measure (p. E-3-410). Impact not expected to be significant.	This impact mechanism will receive further attention during impact assessment refinement (FY84 Task 3.1.3; FY85 Task 5).		Use of multilevel intake structures on the dams to maintain downstream river temperatures as close to normal as possible (p. E-3-526 #5). Habitat enhancement measures in middle basin and on re- placement lands to compensate for per- manent habitat loss (p. E-3-527 #6).
	<pre>*(21) Drifted snow along rail- road and road access corridors and roadway berms may impede movements of moose and/or subject them to higher risk of collision mortality.</pre>	Impact not quantified (Table E.3.145).	Impact will be addressed through impact assessment refinement (FY84 Task 3.1.3; FY85 Task 5).	Collect mortality data on road and railroad collisions (p. E-3-523 #1).	Changes in design and alignment of access road to re- duce impacts on caribou and other species (p. E-3- 533 #11). Possible controls on volume, speed and frequency of access road traffic (p. E-3-534 #12).
	*(22) Impeded drainage caused by road berms may alter moose habitat due to flooding of forest or shrubland areas.	Impeded drainage in certain areas may improve moose habitat, although some habitat alteration could occur due to flooding (p. E-3-227).	Impact will be addressed through impact assessment refinement (FY84 Task 3.1.3).		Minimize loss of forest areas through alignment of access road and transmission corridor and other measures (p. E-3-539 #23; p. E-3-525 #1; p. E-3-526 #2). Design and alignment measures to minimize impacts on wetlands (p. E-3-292 #18, 19).
	(23) Displacement of moose during reservoir filling years and alteration of movements between winter and summer range after project completion could increase predation rates, possibly driving moose populations to low levels which may be maintained there by continued predation.	Impact not quantified (Appendix EllJ, Volume 10B).	Moose calf mortality study (FY84 Task 4.1.3; FY85 Task 9); moose population modeling (FY85 Task 16).	Collect information on wolf populations throughout con- struction and into operation (p. E-3-525 #7). Collect information on bear populations and distribution of bear harvest (p. E-3-534 #14).	If needed, controlled moose hunt to avoid over-browsing by dis- placed moose (p. E-3-530 #8).

(I) Affected Species or Group	(II) Impact Mechanism	(III) Impact Assessment Status	(IV) Ongoing and Planned Studies	(V) Proposed Monitoring	(VI) Proposed Mitigation Measures
(A) Moose	* (24) Decrease in habitat qual- ity may occur near the im- poundments due to locally high densities of moose dispersing from impounded areas.	Because the moose population of the middle Susitna Basin is probably below carrying capacity at present (Ballard et al. 1982, p. 52), major or widespread habitat deter- ioration surrounding the im- poundments is not likely unless large moose population increases occur in the future.	Refine and test moose carrying capacity model (FY85 Task 11).	Document browse production on lands enhanced for moose browse (p. E-3-525 #11).	Impoundment clearing will not begin until 2 or 3 years before filling; patches of vegetation will be left until just before filling (p. E-3-525 #1). Habitat enhancement measures in middle basin and on replace- ment lands to compen- sate for permanent habitat loss (p. E-3- 527 #6). If needed, controlled moose hunt to avoid over-browsing by dis- placed moose (p. E-3- 530 #8). Acquisition of replace-
					ment lands for imple- mentation of habitat enhancement measures (p. E-3-292 #12).
	*(25) Increase in ground-based human activity (road traffic, village activities, dam con- struction) may preclude use of some areas by moose (particu- larly sensitive areas such as calving sites and winter	Impact not quantified; some habituation can be expected (Table E.3.145).	Previous studies provided sufficient information for impact assessment. No further studies are planned.		Major ground activity will be prohibited near sensitive wildlife areas during sensitive periods (p. E-3-532 #10).
	habitat).				Public access to access road and airfield pro- hibited during construc- tion (p. E-3-534 #12, 14).
					Use of project facilities or equipment by employees and families for hunting and trapping will be pro- hibited (p. E-3-534 #14).
					If needed, recommenda- tions for restrictions to hunting regulations to reduce hunting pressure (p. E-3-534 #14).
					Discouragement of off- road recreational vehicle activity, and phasing in of recreational plan to limit recreational im- pacts on vegetation and wildlife (p. E-3-292 #16- 17).

-

(I) Affected Species or Group	(II) Impact Mechanism	(III) Impact Assessment Status	(IV) Ongoing and Planned Studies	(V) Proposed Monitoring	(VI) Proposed Mitigation Measures
(A) Moose	* (26) Increase in aircraft over- flights may stress animals or preclude use of some areas.	Impact not quantified but not expected to be signi- ficant unless direct harassment occurs. Habit- uation is possible to neutral and predictable disturbance, such as near airports (Table E.3.145).	Previous studies provided sufficient information for impact assessment. No further studies are planned.	-	Aircraft will maintain minimum altitudes of 1000 ft above ground level during flights (p. E-3-531 #10). Planning and develop- ment of an environmen- tal briefings program for all field personnel (p. E-3-292 #13).
	(27) Increase in mortality due to hunting and poaching.	Impact not quantified. Hunting can be regulated (Table E.3.145) but increased poaching due to increased access may represent an unavoidable adverse impact.	Further data collection and analysis regarding current and future use of wildlife in the project area is planned (Social Science FY85 Recreation Tasks 4-6).		<pre>Public access to access road and airfield pro- hibited during con- struction (p. E-3-534 #12, 14). Use of project facili- ties or equipment by em- ployees and families for hunting and trapping will be prohibited (p. E-3-534 #14). If needed, recommenda- tions for restrictions to hunting regulations</pre>
					to reduce hunting pres- sure (p. E-3-534 #14). Discouragement of off- road recreational vehicle activity, and phasing in of recrea- tional plan to limit recreational impacts on vegetation and wild- life (p. E-3-292 #16-17).
	*(28) Increase in risk of fires due to human activities.	Fires may destroy some moose habitat over the short term but regenerated burns may provide produc- tive moose habitat several years later (Table E.3.145).	A literature review of habitat enhancement techniques is underway (FY84 Task 4.1.11) and field studies of disturbed areas are planned (FY85 Task 14).		Public access to access road and airfield pro- hibited during con- struction (p. E-3-534 #12, 14). Planning and development of an environmental briefings program for all field personnel (p. E-3-292 #13).

'n

(I) Affected Species or Group	(II) Impact Mechanism	(III) Impact Assessment Status	(IV) Ongoing and Planned Studies	(V) Proposed Monitoring	(VI) Proposed Mitigation Measures
(A) Moose	* (29) Increase in disturbance over the entire basin due to increases in human recreational activities.	Impact not quantified (Appendix EllJ, Volume 10B).	This impact mechanism will receive further attention during impact assessment refinement (FY84 Task 3.1.3; FY85 Task 5).		Public access to access road and airfield pro- hibited during con- striction (p. E-3-534 #12, 14).
					Use of project facili- ties or equipment by em- ployees and families for hunting and trapping will be prohibited (p. E-3-534 #14).
			Ň		Planning and develop- ment of an environmental briefings program for all field personnel (p. E-3-292 #13).
					Discouragement of off- road recreational vehicle activity, and phasing in of recreational plan to limit recreational im- pact on vegetation and wildlife (p. E-3-292 #16-17).
(B) Caribou	*(1) Permanent loss of 0.3% of total range (low quality grazing habitat) due to the impoundments and transmission corridors.	Impact not expected to be significant (p. E-3-416; Table E.3.147)	Continued studies of move- ments of herd and range use (FY84 Task 4.3; FY85 Task 22).	Collect data on caribou movements and population size, especially as relates to impoundment crossing (p. E-3-523 #3).	Selective clearing in transmission cor- ridor, permitting seral vegetation up to 10 ft in height (p. E-3-526 #4).
	*(2) Temporary alteration and permanent loss of 0.3% of summer range for bulls due to borrow sites.	Impact not expected to be significant (p. E-3-415; Table E.3.147).	Continued studies of move- ments of herd and range use (FY84 Task 4.3; FY85 Task 22).	Collect data on caribou move- ments and population size (p. E-3-523 #3).	Revegetation and fertilization of disturbed sites (p. E-3-526 #3).
	(3) Potential effects of the impoundment as a barrier to movements include: a) altered movement patterns may reduce the frequency of crossing of the Watana impoundment area with consequent decreases in use of portions of the range, reducing habitat availability; b) isolation of subherds having separate calving grounds; c) increase in accident mortality associated with ice shelving, drifting ice flows, floating debris, and extensive mud flats; d) increased energy expenditure due to lengthened migration routes, possibly resulting in reduced viability of newborn calves and other consequences of reduced physical condition.	Impact difficult to quantify or predict; may be serious, or may result in little adverse impact (pp. E-3-416 to 417, Table E.3.147).	Continued studies of move- ment of herd, range use, population size, and pro- ductivity; continued stu- dies of movements of upper Susitna-Nenana subherd and its population size (FY84 Task 4.3; FY85 Task 22).	Collect data on caribou move- ments and population size, especially as relates to impoundment crossing (p. E-3-523 #3). Collect records of impound- ment crossings and impound- ment-caused mortality during open-water period (p. E-3- 524 #5).	Clearing of im- poundments prior to flooding and removal of float- ing debris to reduce hazards to crossing (p. E-3- 530 #9).

Group		Status	Planned Studies	Monitoring	Mitigation
(B) Caribou					neasures
(b) Caribou	 *(10a) Increased legal harvest levels may result from increased road access by hunters to caribou range. (10B) Increased mortality may result from increased road access by illegal hunters to caribou range. 	Because caribou hunting is regulated by permit, increased access will affect only the distribu- tion of legal hunters, not their total number. The maximum number of animals legally havested in the project vicinity will not increase. However, increased access by poachers may lead to increased illegal harvest levels.	Continued studies of movements and range use of herd and subherd (FY84 Task 4.3; FY85 Task 22).		Public access to access road and airfield pro- hibited during con- struction (p. E-3-534 #12, 14). Use of project facili- ties or equipment by em- ployees and families for hunting and trapping will be prohibited (p. E-3-534 #14).
					If needed, recommenda- tions for restrictions to hunting regulations to reduce hunting pressure (p. E-3-534 #14).
					Discouragement of off-road recreational vehicle activity, and phasing in of recrea- tional plan to limit recreational impacts on vegetation and wildlife (p. E-3- 292 #16-17).
	mortality due to construction traffic and increased recreational traffic.	Impact not quantified, but not expected to'be sig- nificant (pp. E-3-479 to 482; Table E.3.147).	Continued studies of move- ments and range use of herd and subherd (FY84 Task 4.3; FY85 Task 22).	Collect mortality data on road and railroad collisions (p. E-3-523 #1).	Changes in design and alignment of access road to reduce impacts on caribou and other species (p. E-3- 533 #11).
					Possible controls on volume, speed and frequency of access road traffic (p. E-3-534 #12).
					Public access to access road and airfield prohi- bited during con- struction (p. E- 3-534 #12, 14).
					Discouragement of off-road recreational vehicle activity, and phasing in of recrea- tional plan to limit recreational impacts on vegetation and wild- life (p. E-3-292 #16-17).

(I) Affected Species or Group	(II) Impact Mechanism	(III) Impact Assessment Status	(IV) Ongoing and Planned Studies	(V) Proposed Monitoring	(VI) Proposed Mitigation Measures
(B) Caribou	* (12) Changes in range use, disruption of migration patterns and abandonment of traditional calving areas due to an increase in recreational activities and an increase in non-project development estimation both facilitated	Impact not quantified (Table E.3.147).	Continued studies of move- ments and range use (FY84 Task 4.3; FY85 Task 22).	Collect data on caribou move- ments and population size (p. E-3-523 #3).	Changes in design and alignment of access road to reduce impacts on caribou and other species (p. E-3- 533 #11).
	through increased access.				Public access to access road and airfield prohi- bited during con- struction (p. E-3- 534 #12, 14).
					Discouragement of off-road recreational vehicle activity, and phasing in of recrea- tional plan to limit recreational impacts on vegetation and wildlife (p. E-3-292 #16-17).
	*(13) Decrease in range values due to increased risk of fire.	Difficult to quantify; caribou are less likely than moose to benefit from occurrence of fire (Table E.3.147).	Continued studies of move- ments and range use (FY84 Task 4.3; FY85 Task 22).	Collect data on caribou move- ments and population size (p. E-3-523 #3).	Public access to access road and air- field prohibited during construction (p. E-3-534 #12, 14).
		•			Discouragement of off-road recreation- al vehicle activity, and phasing in of re- creational plan to limit recreational impacts on vegeta- tion and wildlife (p. E-3-292 #16-17).
(C) Dall Sheep	*(1) Partial inundation of the Jay Creek mineral lick. Inun- dation will cover over 22% of the lick surface area during the months of maximum use. At maximum impoundment level in October, 42% of lick surface will be flooded.	Unlikely that sheep will discontinue use of the lick due to partial inundation (pp. E-3-419 to 420, Table E.3.148).	Study of sheep use of lick area, of mineral content of licks, and of sheep distribution in study area (FY84 Task 4.4).	Collect information on sheep use of mineral lick and on leaching of soils after inundation (p. E-3-524 #5).	If needed, exposure of new soil at Jay Creek mineral lick (p. E-3-534 #13).
	*(2) Increase in accident mor- tality due to ice shelves on lower sections of the Jay Creek mineral lick in early spring.	Impact not quantified (Table E.3.148).	Study of sheep use of lick area (FY84 Task 4.4).	Collect information on sheep use of mineral lick and on leaching of soils after inundation (p. E-3-524 #5).	

ni-

(I) Affected Species or Group	(II) Impact Mechanism	(III) Impact Assessment Status	(IV) Ongoing and Planned Studies	(V) Proposed Monitoring	(VI) Proposed Mitigation Measures
(C) Dall Sheep	* (3) Impoundment may block some movement to lick sites on the east side of Jay Creek.	Impact not quantified, but may reduce use of lick on east side (p. E-3-512).	Study of sheep use of lick area (FY84 Task 4.4).	Collect records of impound- ment crossings and impound- ment-caused mortality during open-water period (at Jay Creek)(p. E-3-524 #4). Collect information on sheep use of mineral lick and on leaching of soils after inundation (p. E-3-524 #5).	Clearing of impound- ments prior to flood- ing and removal of floating debris to reduce hazards to crossing (p. E-3- 530 #9). If needed, exposure of new soil at Jay Creek mineral lick (p. E-3-534 #13).
	<pre>* (4) Areas of the lick below maximum fill level may suffer some leaching and erosion, making this area less valuable as a lick site.</pre>	Erosion here may also increase availability of minerals; however, some leaching will also occur (pp. E-3-419 to 420, Table E.3.148).	Study of sheep use of lick area, and of mineral con- tent of licks (FY84 Task 4.4).	Collect information on sheep use of mineral lick and on leaching of soils after inundation (p. E-3-524 #5).	If needed, exposure of new soil at Jay Creek mineral lick (p. E-3-534 #13).
	*(5) Increased metabolic energy requirements and abandonment of some areas due to aircraft overflights.	Impact not quantified but not expected to be signif- icant if height restric- tions are maintained (pp. E-3-418 to 419, Table E.3.148).	Sufficient information is available for impact assessment and mitigation planning. No studies planned.		Aircraft will maintain minimum altitudes of 1000 ft above ground level during flights (p. E-3-531 #10). Planning and develop- ment of an environmen- tal briefings program for all field person- nel (p. E-3-292 #13).
	*(6) Disturbance of sheep uti- lizing low elevation winter and spring habitats due to impound- ment clearing activities.	Impact not quantified. Disturbance will occur only over the short-term period of impoundment clearing and will probably not produce a serious popula- tion effect (Table E.3.148).	Studies of sheep winter distribution (FY84 Task 4.4).		Impoundment clearing schedule to be deter- mined in consultation with resource agencies (p. E-3-526 #1).

	- 				
(C) Dall Sheep	* (7) Disturbance from aircraft landings, clearing activities, and recreational boats near the Jay Creek mineral lick may affect its use by sheep.	Impact not quantified; but not expected to be signifi- cant with planned project controls, provided there is little recreational distur- bance. Frequent visits could result in abandonment of the lick with resultant	Sufficient information is available for impact assess- ment and mitigation. No studies planned.	Collect information on sheep use of mineral lick and on leaching of soils after inundation (p. E-3-524 #5).	Aircraft will main- tain minimum alti- tudes of 1000 ft above ground level during flights (p. E-3-531 #10). Aircraft landings
· .		local population levels (p. E-3-420, Table E.3.148).			will be prohibited within 0.5 mile of Jay Creek licks, 15 April to 15 June (p. E-3-531 #10).
					Major ground acti- vity (including boat and floatplane use) will be prohibited within 0.5 mile of Jay Creek licks, 15 April to 15 June (p. E-3-532 #10).
	*(8) Watana impoundment may delay spring phenology and lead to increased snow acumulation in south-facing slopes of Watana Hills.	Impact not quantified, but not expected to be signi- ficant (Table E.3.148).	Impact severity not suffi- cient to require study.		
	<pre>*(9) Watana impoundment may block very occasional in- migration of sheep into Watana Hills herd from Talkeetna Mountains popula- tion.</pre>	Impact not quantified and importance not known.	If in-migration occurs it is too infrequent to make its study feasible.		
(D) Brown Bear	(1) Permanent loss of some spring feeding habitat due to impoundments.	Of radio-collared brown bears present in the project area, 50% in 1980 and 61% in 1981 moved into the future impoundment zones in spring. This loss is expected to be most important to brown bear populations in spring when greatest use of inundated and adjacent areas occurs. Some use also occurs in summer and fall. (p. E-3-420 to 425, Table E.3.149).	Continued studies of habi- tat use and timing, den site characteristics, and seasonal food habits (FY84 Task 4.5; FY85 Task 17).	Collect information on bear populations and distribution of bear harvest (p. E-3-534 #14).	Habitat enhancement measures in middle basin and on replace- ment lands to compen- sate for permanent habitat loss will benefit bears (p. E-3-527 #6).

(I) Affected Species or Group	(II) Impact Mechanism	(III) Impact Assessment Status	(IV) Ongoing and Planned Studies	(V) Proposed Monitoring	(VI) Proposed Mitigation Measures
(D) Brown Bear	* (2) Reductions in upstream ungulate prey populations may cause corresponding reductions in available food supply for bears, especially in the spring.	Impact not quantified (pp. E-3-425 to 426, Table E.3.149).	Continued studies of sea- sonal food habits (FY84 Task 4.5; FY85 Task 17). Moose calf mortality study (FY84 Task 4.1.3; FY85 Task 9).		Impacts from decreased prey availability should be reduced by measures to mitigate impacts to ungulate populations (p. E-3- 536 #16).
	*(3) Disturbance from access corridors, villages, airstrips, and clearing of transmission line may displace bears from current denning areas.	Significant impact not expected because brown bear dens are typically at higher elevations than proposed project facilities; identified dens are not in the vicinity of such facilities (Miller 1984, Table 23 and Fig 8).	Continued studies of den site characteristics (FY84 Task 4.5; FY85 Task 17).	Collect information on den locations throughout con- struction (p. E-3-524 #6).	Ground activity will be prohibited within 0.25 miles of known active bear dens between 15 September and 15 May (p. E-3- 532 #10). Planning and develop- ment of an environmen- tal briefings program for all field personnel (p. E-3-292 #13).
	* (4) Impoundment clearing will affect habitat quality for brown bears in spring.	Impact not expected to be significant in the 2-3 years before filling (p. E-3-422, Table E.3.149).	Continued studies of sea- sonal food habits (FY84 Task 4.5; FY85 Task 17).	Collect information on bear populations and distribution of bear harvest (p. E-3-534 #14).	Impoundment clearing will not begin until 2 or 3 years before fil- ling; patches of vege- tation will be left until just before fil- ling (p. E-3-525 #1).
	* (5) Loss or alteration of habitat due to borrow sites.	Impact not quantified. Habitat values may increase on reclaimed areas during early stages of plant succession (p. E-3-421 to 422).	Continued studies of habitat use and timing (FY84 Task 4.5; FY85 Task 17).		Habitat loss will be minimized by side borrow techniques for road construction, spoil deposition in impoundments or deplet- ed borrow areas, and consolidation of pro- ject facilities (p. E-3-526 #2).
					Revegetation and fertilization of disturbed sites (p. E-3-526 #3).
	*(6) Potential impact on denning areas due to impoundment shore erosion.	Impact may occur on poten- tial or unknown den sites, but has not been quanti- fied; not expected to be significant (Table E.3.149).	Continued studies of den site characteristics (FY84 Task 4.5; FY85 Task 17).		
	(7) Broken ice and ice shelving, open water in the impoundments, roads, and other facilities may block or hinder access to habitually used areas.	Impact not quantified (pp. E-3-426, 483, 484, Table E.3.149).	Continued studies of sea- sonal habitat use and movements (FY84 Task 4.5; FY85 Task 17).	Collect records of impound- ment crossings and impound- ment-caused mortality during open-water period (p. E-3- 524 #4).	Clearing of impound- ments prior to flood- ing and removal of floating debris to reduce hazards to crossing (p. E-3-530 #9).

(I) Affected Species or Group	(II) Impact Mechanism	(III) Impact Assessment Status	(IV) Ongoing and Planned Studies	(V) Proposed Monitoring	(VI) Proposed Mitigation Measures
(D) Brown Bear	* (8) Avoidance of traditional use areas caused by increase in human activity at construction sites and operations facilities.	Impact includes loss of feeding habitat near access corridors, villages, air- strips, and borrow sites. Some bears may be displaced or alter their movements; other may habituate and lead to human/bear inter- action problems. (p. E-3- 424, Table E.3.149).	Continued studies of habi- tat use and timing (FY84 Task 4.5; FY85 Task 17).	Collect information on bear populations and distribution of bear harvest (p. E-3-534 #14).	Possible controls on volume, speed and fre- quency of access road traffic (p. E-3-534 #12). Avoidance of the Prai- rie Creek and Stephan Lake areas by access routing (p. E-3-292 #14).
	* (9) Increase in mortality of bears due to attraction to human refuse and revegetated areas near construction sites, and the resultant increase in the incidence of human/bear encounters, resulting in destruction of the "offending bear".	Impact not quantified and difficult to predict (p. E-3-423 to 424, Table E.3.149).	Sufficient information is available for impact assessment and mitigation. No studies planned.	Collect information on bear populations and distribution of bear harvest (p. E-3-534 #14).	Education program, and strict garbage-control measures and enforce- ment to prevent crea- tion of nuisance ani- mals (p. E-3-535 #15). Planning and develop- ment of an environmen- tal briefings program for all field personnel (p. E-3-292 #13).
	<pre>*(10) Greater susceptibility of bears (particularly habituated bears) to hunting and poaching mortality due to improved access in the area.</pre>	Hunting policy for the project area currently allows liberal brown bear harvest levels which can be regulated in the future. Losses to poachers will be an unavoidable adverse impact (pp.E-3-423, 426, 484; Table E.3.149).	Sufficient information is available for impact assess- ment and mitigation plan- ning. No studies are planned.	Collect information on bear populations and distribution of bear harvest (p. E-3-534 #14).	Public access to access road and airfield pro- hibited during con- struction (p. E-3-534 #12, 14). Use of project facili- ties or equipment by employees and families for hunting and trapping will be prohibited (p. E-3-534 #14). If needed, recommenda- tions for restrictions to hunting regulations to reduce hunting pres- sure (p. E-3-534 #14). Discouragement of off- road recreational vehicle activity, and phasing in of recrea- tional plan to limit recreation and wildlife (p. E-3-292 #15-17).
	*(11) Lower population sizes and decreased recruitment of bears in the study area may result in fewer subadults from the study area available to disperse out to and populate adjacent areas.	Impact difficult to quanti- fy, but may affect nearby populations.	Opportunistic information on dispersal in the course of marked bear studies (FY84 Task 4.5; FY85 Task 17).		

ų.

(111)	(1V)	(v)	(VI)
Assessment Status	Ongoing and Planned Studies	Proposed Monitoring	Mitigation Measures
May affect cub survival, increase predation pres- sure on ungulates, increase intraspecific mortality, and decrease reproduction.	Continued studies of sea- sonal habitat use and food habits (FY84 Task 4.5; FY85 Task 17).	Collect information on bear populations and distribution of bear harvest (p. E-3-534 #14).	
Mitigation for salmon and moose may negate this aspect of the impact. Altered plant succession may reduce or increase plant foods available to bears.	Downstream moose studies (FY84 Task 4.2.3; FY85 Task 23). Downstream hydrologic and vegetative studies (FY84 Task 4.2.4; FY85 Task 15). Salmon studies (Aquatic FY85 Tasks 12-16).	Collect data on changes in downstream vegetative cover (p. E-3-523 #2).	Impacts from decreased prey availability should be reduced by measures to mitigate impacts to salmon and ungulate populations (p. E-3-536 #16).
*(14) Aircraft overflights may disrupt feeding, resting, and denning.	Sufficient information is available for impact assess- ment and mitigation plan- ning. No studies are planned.		Aircraft will maintain minimum altitudes of 1000 ft above ground level during flights (p. E-3-531 #10). Planning and develop-
			ment of an environmen- tal briefings program for all field personnel (p. E-3-292 #13).
Impact not quantified, but could be significant. Most significant impact would likely be from recreational activity in the Prairie Creek-Stephan Lake area	Continued studies of sea- sonal habitat use and food habits (FY84 Task 4.5; FY85 Task 17).		Public access to access road and airfield pro- hibited during con- struction (p. E-3-534 #12, 14).
a traditional area for summer feeding on salmon (p. E-3-421, Table E.3.149).			Avoidance of the Prairie Creek and Stephan Lake areas by access routing (p. E-3-292 #14).
			Discouragement of off- road recreational vehicle activity, and

					tal briefings program for all field personnel (p. E-3-292 #13).
	(15) Recreational disturbance facilitated by increased access may cause avoidance of tradi- tional use areas and may lead to increase in human/bear interactions.	Impact not quantified, but could be significant. Most significant impact would likely be from recreational activity in the Prairie Creek-Stephan Lake area a traditional area for summer feeding on salmon	Continued studies of sea- sonal habitat use and food habits (FY84 Task 4.5; FY85 Task 17).		Public access to access road and airfield pro- hibited during con- struction (p. E-3-534 #12, 14). Avoidance of the Prairie Creek and Stephan Lake
		(p. E-3-421, lable E.3.149).			areas by access routing (p. E-3-292 #14).
					Discouragement of off- road recreational vehicle activity, and phasing in of recrea- tional plan to limit recreational impacts on vegetation and wildlife (p. E-3-292 #16-17).
(E) Black Bear	(1) Permanent loss of high quality forest habitats due to impoundments.	Will exclude black bears upstream from Watana Creek and significantly lower populations in the project area (p. E-3-427, Table E.3.150).	Continued monitoring of black bear populations and movements in the area is planned (FY84 Task 4.5; FY85 Task 17). Refinement of bear popula- tion models will also continue (FY84 Task 17).	Collect information on bear populations and distribution of bear harvest (p. E-3-534 \$14).	Habitat enhancement measures in the middle basin and on replace- ment lands to compen- sate for permanent habitat loss will provide some benefits for black bears (p. E-3-527 #6).
					1

.

(11)

Impact Mechanism

(12) Displacement of bears from presently used habitats (especially in spring) may result in locally more dense populations and greater intraspecific competition and strife in adjacent areas.

* (13) Possible reduction in availability of animal prey (e.g., salmon, moose) and vegetable foods in downstream

*(14) Overflights or harassment by aircraft may disrupt feed-ing, resting and denning activities.

(D)- Brown Bear

....

(I) Affected Species or Group	(II) Impact Mechanism	(III) Impact Assessment Status	(IV) Ongoing and Planned Studies	(V) Proposed Monitoring	(VI) Proposed Mitigation Measures
(E) Black Bear	(2) Permanent loss of some den sites due to impoundments, and due to disturbance and dis- placement from construction and operation facilities and activities.	Of known black bear dens in the project area, 54% were in the Watana and 6% were in the Devil Canyon impoundment zones (Miller 1983).	Identification of active den sites of black bears will continue (FY84 Task 4.5; FY85 Task 17).	Collect information on black bear den locations throughout construction (p. E-3-524 #6).	Major ground activity will be prohibited within 0.25 miles of all known active bear dens between September 15 and May 15 (p. E-3-532 #10).
	(3) Loss of cover and foraging areas in forest habitats due to impoundment clearing.	This will be realized prior to impoundment filling due to clearing activities (p. E-3-428, Table E.3.150).	Continued monitoring of black bear populations and movements in the area is planned (FY84 Task 4.5; FY85 Task 17).		Impoundment clearing will not begin until 2 or 3 years before filling; patches of vegetation will be left until just before filling (p. E-3-525 #1).
	* (4) Temporary loss of forest habitats in borrow sites.	Impact represents a tem- porary loss of habitat for black bears. Revegetation will provide spring forage during early successional stages, and regrowth of forest will provide con- tinued habitat for bears (p. E-3-427, Table E.3.150).	Continued studies of black bear populations and movements (FY84 Task 4.5; FY85 Task 17).		Habitat loss will be minimized by side bor- row techniques for road construction, spoil deposition in impound- ments or depleted bor- row areas, and consoli- dation of project facil- ities (p. E-3-526 #2).
		•			Novegetation and left lization of disturbed sites (p. E-3-526 #3). Minimize loss and alter- ation of habitat, par- ticularly less abundant habitats and sensitive wildlife habitats (p. E-3-291 #1-11).
	*(5) Possible impact on den sites due to impoundment shore erosion.	Impact not quantified; potential or unknown den sites may be affected but impacts are not expected to be significant (Table E.3.150).	Continued studies of den site characteristics (FY84 Task 4.5; FY85 Task 17).	Collect information on den locations throughout con- struction (p. E-3-524 #6).	
	*(6) Habitat alteration along the transmission corridor.	Positive and negative im- pacts on black bears. Loss of forest habitats along the corridor will consti- tute some habitat loss, although spring forage within the corridors will provide added food (p. E-3-494, Table E.3.150).	Continued studies of black bear habitat use and movements (FY84 Task 4.5; FY85 Task 17).	Collect information on bear populations and distribution of bear harvest (p. E-3-534 #14).	Selective clearing in transmission corridor, permitting seral vege- tation up to 10 ft in height (p. E-3-526 #4). Minimize loss of forest areas through alignment of access road and transmission corridor, and other measures (p. E-3-539 #23).

.....

1.÷--.

(I) Affected Species or Group	(II) Impact Mechanism	(III) Impact Assessment Status	(IV) Ongoing and Planned Studies	(V) Proposed Monitoring	(VI) Proposed Mitigation Measures
(E) Black Bear	* (7) Reduction in availability of low shrub habitats in spring due to delayed melting of snow drifts south and southwest of the impoundment.	Impact not quantified, but not expected to be signi- ficant (Table E.3.150).	Impact severity not suffi- cient to require study.	Collect information on bear populations and distribution of bear harvest (p. E-3-534 #14).	
	* (8) Reductions in prey popula- tions, if they occur (e.g., salmon, moose), would nega- tively impact black bears in downstream areas.	Project impacts on some food resources of black bears are as yet uncertain, and bears may not be adversely affected (p. E-3-429, Table E.3.150).	Continued investigations of bear food habits will better document important food sources of black bears (FY84 Task 4.5; FY85 Task 17).	Collect information on bear populations and distribution of bear harvest (p. E-3-534 #14).	Impacts from decreased prey availability should be reduced by measures to mitigate impacts to salmon and ungulate populations (p. E-3-536 #16).
	*(9) Increased availability of early spring forage downstream from impoundments due to alteration of vegetation phenology.	No noticeable impact ex- pected on black bears (p. E-3-429).	Impact severity not suffi- cient to require study.	Collect data on changes in downstream vegetative cover (p. E-3-523 #2).	Use of multilevel in- take structures on the dams to maintain down- stream river tempera- tures as close to normal as possible (p. E-3-526 #5).
	* (10) Decreased availability of early successional vegetation types due to river hydrologic changes downstream of the impoundments.	Impact not quantified but not expected to be signi- ficant (p. E-3-429, Table E.3.150).	Continued refinement of downstream hydrology modeling may better enable prediction of effects on black bears (FY84 Task 4.2.4).	Collect data on changes in downstream vegetative cover (p. E-3-523 #2).	
	<pre>* (11) Broken ice and/or shelv- ing, open water in the im- poundments, roads, and other facilities may block or hinder access to habitually used areas (e.g., seasonally used feeding areas).</pre>	Impact not quantified but not expected to be signi- ficant (Table E.3.150).	Continued study of habitat use and movements (FY84 Task 4.3; FY85 Task 17).	Collect records of impoundment crossings and impoundment- caused mortality during open- water periods (p. E-3-524 #4).	Clearing of impound- ments prior to flood- ing and removal of floating debris to re- duce hazards to cross- ing (p. E-3-530 #9).
	*(12) Increase in interspecific competition with and predation by brown bears and intraspeci- fic competition among black bears during dispersal from impoundment zones.	Impact not quantified (Table E.3.150).	Investigations of bear movements and mortality sources are continuing (FY84 Task 4.5; FY85 Task 17).	Collect information on bear populations and distribution of bear harvest (p. E-3-534 #14).

(E) Blac	k Bear *	(15) Greater susceptibility of habituated bears to hunting and poaching mortality.	Hunting mortality can be regulated, although increased poaching losses may represent an unavoid- able adverse impact (Table E.3.150).	Sufficient information is available for impact assess- ment and mitigation plan- ning. No studies are planned.	Collect information on bear populations and distribution of bear harvest (p. E-3-534 #14).	Use of project facili- ties or equipment by em- ployees and families for hunting and trapping will be prohibited (p. E-3-534 #14). If needed, recommenda- tions for restrictions to hunting regulations to reduce hunting pres- sure (p. E-3-534 #14).
	4	*(16) Disturbance from aircraft overflights may disrupt normal feeding, resting and denning activities.	Impact not quantified, but not expected to be signifi- cant (Table E.3.150).	Sufficient information is available for impact assess- ment and mitigation plan- ning. No studies are planned.		Aircraft will maintain minimum altitudes of 1000 ft above ground level during flights (p. E-3-531 #10).
		*(17) Lower population sizes and decreased recruitment of bears in the study area may result in fewer subadults from the study area available to dis- perse out to and populate adjacent areas.	Impact difficult to quantify, but may affect nearby populations.	Opportunistic information on dispersal in the course of marked bear studies (FY84 Task 4.5; FY85 Task 17).		
(F) Wo	lf	(1) Permanent loss of portions of territories of at least six packs.	Impact represents an abso- lute habitat loss for wolves, but is tnlikely to affect local wolf popula- tions. Wolf numbers are currently highly regulated by trapping and removal for game management purposes (p. E-3-431, Table E.3.151).	Continued studies of wolf pack sizes and distribu- tions (FY84 Task 4.6; FY85 Task 28).	Collect information on wolf populations throughout con- struction and into operation (p. E-3-525 #7).	
		*(2) Inundation of parts of ranges of six packs will cause upheaval of the historical dis- tribution of packs due to associated social strife.	Impact will occur over the short-term, when ungulate prey populations are also undergoing shifts; effects are not expected to be significant (p. E-3-431, Table E.3.151).	Continued studies of wolf pack sizes and distribu- tions (FY84 Task 4.6; FY85 Task 28).	Collect information on wolf populations throughout con- struction and into operation (p. E-3-525 #7).

(I) Affected Species or Group	(II) Impact Mechanism	(III) Impact Assessment Status	(IV) Ongoing and Planned Studies	(V) Proposed Monitoring	(VI) Proposed Mitigation Measures
(F) Wolf	(3) Reduction of carrying capacity of wolves due to reduction of moose (and other prey) carrying capacities.	Impact not quantified (pp. E-3-430 and 431, Table E.3.151).	Continued studies of wolf pack sizes and distribu- tions (FY84 Task 4.6; FY85 Task 28). Studies of moose calf mortality and of wolf predation during a severe winter (FY84 Task 4.1.3; FY85 Tasks 9 and 10).	Collect information on wolf populations throughout con- struction and into opera- tion (p. E-3-525 #7).	<pre>Impacts from decreased prey availability to wolves should be reduced by measures to mitigate impacts to ungulate populations (p. E-3-536 #16). Habitat enhancement measures for moose in the middle basin and on replacement lands to compensate for per- manent habitat loss (p. E-3-527 #6).</pre>
	<pre>*(4) Increase in wolf numbers near the impoundment zones due to displacement of moose caused by impoundment clearing activities.</pre>	Short-term beneficial impact (p. E-3-431, Table E.3.151).	Continued studies of wolf pack sizes and distribu- tions (FY84 Task 4.6; FY85 Task 28).	Collect information on wolf populations throughout con- struction and into operation (p. E-3-525 #7).	Impoundment clearing will not begin until 2 or 3 years before filling; patches of vegetation will be left until just before filling (p. E-3-525 #1).
	*(5) Presence of the impoundment and dam facilities may hinder movement of some packs to caribou and moose calving areas.	Impact not quantified (Table E.3.151).	Continued studies of wolf pack distributions (FY84 Task 4.6; FY85 Task 28).	Collect records of impound- ment crossings and impound- ment-caused mortality during open-water period (p. E-3-524 #4).	Clearing of impound- ments prior to flood- ing and removal of floating debris to reduce hazards to crossing (p. E-3-530 #9).
	*(6) Wolves may use the access road to their benefit when hunting ungulate prey.	Beneficial impact not quan- tified; not expected to be significant (Table E.3.151).	Impact severity not suffi- cient to require study.		
	*(7) Open water downstream from the dams may hinder movements of wolves.	Impact not quantified; not expected to be significant (Table E.3.151).	Continued studies of wolf pack distributions (FY84 Task 4.6; FY85 Task 28).		
	*(8) Wolves are likely to avoid areas of intense human activity (e.g., construction areas) or heavy road traffic, at least initially.	Some habituation will likely occur; impact not expected to be significant (p. E-3-430, Table E.3.151).	Continued studies of wolf pack distributions (FY84 Task 4.6; FY85 Task 28).	Collect information on den locations throughout con- struction (p. E-3-524 #6).	Ground activity will be prohibited within 0.25 miles of known active wolf dens or rendezvous sites between 1 May and 31 July (p. E-3-532 #10). Possible controls on volume, speed and fre- quency of access road traffic (p. E-3-534 #12).

(I) Affected Species o Group	(II) Impact r Mechanism	(III) Impact Assessment Status	(IV) Ongoing and Planned Studies	(V) Proposed Monitoring	(VI) Proposed Mitigation Measures
(F) Wolf	* (9) Disturbance of wolves by human activities or aircraft at den sites could lead to pup mortality if the dens are aban- doned during the early weeks of a pup's life.	Impact not quantified (p. E-3-430, Table E.3.151).	Continued studies of wolf pack distributions (FY84 Task 4.6; FY85 Task 28).	Collect information on den locations throughout con- struction (p. E-3-524 #6).	Aircraft will maintain minimum altitudes of 1000 ft above ground level during flights (p. E-3-531 #10).
					Aircraft landings will be prohibited within 0.25 miles of known active wolf dens or rendezvous sites during 1 May to 31 July (p. E-3-531 #10).
					Ground activity will be prohibited within 0.25 miles of known active wolf dens or rendezvous sites between 1 May and 31 July (p. E-3-531 #10).
					Planning and develop- ment of an environmen- tal briefings program for all field person- nel (p. E-3-292 #13).
	*(10) Wolves may habituate to human use areas and have the potential to become nuisance animals, increasing the like- lihood of destruction of the "offending wolf".	Destruction of some nui- sance wolves may occur if mitigation measures are not enforced (p. E-3-430, Table E.3.151), however, this impact is unlikely to be significant in these heavily exploited wolf populations.	Impact severity not suffi- cient to require study.		Education program, and strict garbage-control measures and enforce- ment to prevent crea- tion of nuisance ani- mals (p. E-3-535 #15).
	*(11) Disturbance at den sites from increased access for recreational activities could lead to pup mortality if dens are abandoned during early	Impact not quantified (p. E-3-430, Table E.3.151).	Continued studies of wolf pack distributions (FY84 Task 4.6; FY85 Task 28).	Collect information on den locations throughout con- struction (p. E-3-524 #6).	Public access to access road and airfield pro- hibited during con- struction (p. E-3-534 #12, 14).
	weeks of a pup 5 fife.				Discouragement of off- road recreational vehicle activity, and phasing in of recrea- tional plan to limit recreational impacts on vegetation and wild- life (p. E-3-292 #16-17).

(I) Affected Species or Group	(II) Impact Mechanism	(III) Impact Assessment Status	(IV) Ongoing and Planned Studies	(V) Proposed Monitoring	(VI) Proposed Mitigation Measures
(F) Wolf	(12) Increased mortality of wolves due to hunting, poaching, and trapping.	Hunting of wolves can be regulated, but increased poaching losses may represent an unavoidable adverse impact (p. E-3-485 and 518, Table E.3.151).	Sufficient information is available for impact assessment and mitigation planning. No studies are planned.	· · · · · · · · · · · · · · · · · · ·	Use of project facili- ties or equipment by em- ployees and families for hunting and trapping will be prohibited (p. E-3-534 #14).
	-				If needed, recommenda- tions for restrictions to hunting regulations to reduce hunting pres- sure (p. E-3-534 #14).
(G) Coyote	<pre>* (1) Increase in coyote population may occur near developed areas.</pre>	Impact represents a beneficial effect on coyotes (p. E-3-439).	Continued surveys of furbearer distribution, including downstream areas, will document changes in coyote populations (FY85 Task 26, subtask 1).		
(H) Wolverine	(1) Permanent loss of winter foraging habitat due to impoundments.	Winter habitat for several wolverines will be lost; changes in movements, densities and productivity will affect surrounding populations (p. E-3-432 to 433, Table E.3.152).	Opportunistic collection of data during wolf surveys (FY84 Task 4.6).		
	*(2) Secondary loss of small mammal and grouse prey bases. Changes in prey density will affect movements, population densities, and productivity.	Difficult to predict whether increases in ungulate carrion availability will offset losses of smaller prey (p. E-3-433, Table E.3.152).	Impact severity not suffi- cient to require study.		
	*(3) Increase in availability of prey in areas adjacent to impoundment clearing zones.	Impact represents a short-term beneficial effect (Table E.3.152).	Impact severity not suffi- cient to require study.		
	(4) Disturbance and habitat loss due to impoundment clear- ing will displace wolverines, particularly in winter.	Impact will be similar to (H)(1) and will occur 1-2 years prior to impound- ment filling (Table E.3.152).	Opportunistic collection of data during wolf surveys (FY84 Task 4.6).		Impoundment clearing will not begin until 2 or 3 years before filling; patches of vegetation will be left until just be- fore filling (p. E-3-525 #1).
	*(5) Increase in carrying capacity of the transmission corridor for moose and ptarmigan may beneficially impact wolverines.	Impact represents a small but beneficial effect on wolverines (Table E.3.152).	Impact severity not suffi- cient to require study.		Selective clearing in the transmission corri- dors, permitting seral vegetation up to 10 ft in height (p. E-3-526 #4).

(I) Affected Species or Group	(II) Impact Mechanism	(III) Impact Assessment Status	(IV) Ongoing and Planned Studies	(V) Proposed Monitoring	(VI) Proposed Mitigation Measures
(H) Wolverine	* (6) Alteration of use pat- terns due to presence of the impoundments and changes in home range boundaries.	Conflicting data on home range boundaries of wol- verines and terrain fea- tures make this impact difficult to predict; not expected to be sig- nificant (p. E-3-432).	Opportunistic collection of data during wolf surveys (FY84 Task 4.6).		
	* (7) Avoidance of all areas of human activity (including access road during heavy traffic periods and areas with high levels of recreational activity), at least ini- tially, causing some changes in use patterns or preclusion of use in some areas.	Impact not quantified; not expected to be significant unless high levels of re- creational disturbance occur (p. E-3-486, Table E.3.152).	Opportunistic collection of data during wolf surveys (FY84 Task 4.6).		Possible controls on volume, speed and fre- quency of access road traffic (p. E-3-534 #12). Public access to access road and air- field prohibited during construction (p. E-3-534 #12).
		.			off-road recreational vehicle activity, and phasing in of recrea- tional plan to limit recreational impacts on vegetation and wildlife (p. E-3-292 #16-17).
	(8) Increase in mortality due to hunting, trapping, and poaching.	Impact not quantified but likely the most important impact on wolverines. Hunting and trapping can be regulated, but poaching may represent an unavoidable adverse impact (p. E-3-486, Table E.3.152).	Sufficient information is available for impact assess- ment and mitigation plan- ning. No studies are planned.		If needed, recommenda- tions for restrictions to hunting and trapping regulations to reduce harvest pressure (p. E-3-534 #14). Use of project facili- ties or equipment by em- ployees and families for hunting and trapping will be prohibited (p. E-3-534 #14).
					Public access to access road and air- field prohibited during construction (p. E-3-534 #12, 14).
(I) Belukha	*(1) Water temperature changes at the mouth of the Susitna River due to the project may affect calving.	Water temperatures will not change significantly at the river mouth; impact not expected to occur (p. E-3-433).	Impact severity not suffi- cient to require study.		Use of multilevel intake structures on the dams to maintain downstream river tem- peratures as close to normal as possible (p. E-3-526 #5).

(J) Beaver and Muskrat	* (2) Loss of some habitat for both species due to siltation of ponds, alteration of drain- age patterns, and disturbance near access roads and borrow pits (primarily in the Deadman Creek area)(cont.).				Minimize loss and alter- ation of habitat, par- ticularly less abundant habitats and sensitive wildlife habitats (p. E-3-291 to 292 #1-11). Design and alignment
					measures to minimize impacts on wetlands (p. E-3-292 #18, 19).
	(3) Increased winter flows, stabilized flows, and lack of ice cover will benefit beaver and muskrat downstream.	Impact represents a bene- ficial effect on beavers and muskrat and will pro- bably compensate for losses due to the impoundments and other facilities (p.E-3-434 to 436, Table E.3.153).	Additional information will be obtained from downstream hydrologic and vegetation modelling (FY84 Task 4.2.4). Efforts to refine the beaver population model and field studies to pro- vide information for modeling will continue (FY84 Task 4.8; FY85 Tasks 18, 19 and 20).	Collect data on changes in downstream vegetative cover (p. E-3-523 #2). Collect information on beaver distribution in Deadman Creek and in the downstream flood- plain (p. E-3-525 #8).	Development of down- stream beaver carrying capacity model to yield better impact predictions and refinements to mitiga- tion measures (p. E-3-537 #18). Enhancement of sloughs downstream from Devil Canyon (p. E-3-537 #19).
	(4) Increase in mortality due to hunting, trapping, and poaching.	Hunting and trapping can be regulated, but poaching losses may represent an unavoidable adverse impact (p. E-3-436, Table E.3.153).	Surveys of trappers are con- tinuing to document current harvest levels (FY85 Task 20).		Use of project facili- ties or equipment pro- hibited to employees and families for hunt- ing and trapping (p. E-3-534 #14). If needed, recommenda- tions for restrictions to hunting and trapping regulations to reduce harvest pressure (p. E-3-534 #14).
	*(5) Downstream daily flow fluc- tuations may freeze out or flood beaver lodges and/or food caches in winter.	Short-term flow fluctua- tions in winter are not anticipated to be of a magnitude detrimental to beaver survival (p. E-3-469).	Information from ice- modeling efforts is being incorporated in the beaver model (FY85 Task 19).		Development of down- stream beaver carrying capacity model to yield better impact predic- tions and refinements to mitigation measures (p. E-3-537 #18).
(K) Mink and Otter	(1) Permanent habitat loss due to the impoundments.	Elimination of a substan- tial portion of good qua- lity habitat for both species (53 miles of mainstem plus 9.7 miles of stream habitat) will occur (p. E-3-436, Table E.3.155).	Distribution of furbearers in the downstream area and in the impoundment zones will be studied (FY85 Task 26, subtask 1). Fall concentrations of mink and otter along the Susitna River will also be surveyed to improve impact assessment (FY85 Task 26, subtask 2).		

_

(I) Affected Species or Group	(II) Impact Mechanism	(III) Impact Assessment Status	(IV) Ongoing and Planned Studies	(V) Proposed Monitoring	(VI) Proposed Mitigation Measures
(K) Mink and Otter	* (2) Habitat loss due to im- poundment clearing activities and resultant decrease in cover and prey availability.	Short-term impact affecting the same populations affected by impoundment filling. Impact will occur 2-3 years prior to filling (Table E.3.155).	See (K)(1).		Impoundment clearing will not begin until 2 or 3 years before filling; patches of vegetation will be left until just be- fore filling (p. E-3-525 #1).
	* (3) Habitat loss due to the access corridor.	Proposed road route will remove 12.3 miles of stream shore habitats along Deadman Creek (p. E-3-438).	Previous studies provided sufficient information for impact assessment. No fur- ther studies are planned.		Habitat loss will be minimized by side bor- row techniques for road construction, spoil deposition in impound- ments or depleted bor- row areas, and consoli- dation of project facilities (p. E-3-526 #2).
					Modifications of borrow requirements and tech- niques to minimize loss of habitat for aquatic furbearers (p. E-3-536 #17).
					Minimize loss of forest areas through alignment of access road and transmission corridor and other measures (p. E-3-539 #23).
					Minimize loss and alter- ation of habitat, par- ticularly less abundant habitats and sensitive wildlife habitats (p. E-3-291, 292 #1-11).
	*(4) Increase in small mammal prey in reclaimed areas.	This impact represents a beneficial impact to mink, although benefits will probably be of little significance (Table E.3.155).	Impact severity not suffi- cient to require study.		Revegetation and ferti- lization of disturbed sites (p. E-3-526 #3).
	*(5) Increase in beaver popu- lation, stabilization of water levels, and open water down- stream will benefit mink and otter.	Impact represents a bene- ficial effect on mink and otter (Table E.3.155).	Surveys of furbearer popula- tions and distribution in the downstream area are planned (FY85 Task 26, subtask 1).		Enhancement of sloughs downstream from Devil Canyon (p. E-3-537 #19).

(I) Affected Species or Group	(II) Impact Mechanism	(III) Impact Assessment Status	(IV) Ongoing and Planned Studies	(V) Proposed Monitoring	(VI) Proposed Mitigation Measures
(K) Mink and Otter	*(6) Abandonment of habitat near construction zones and recreation areas due to human disturbance.	Effects would be most- noticeable on the remain- ing habitat areas along the upper reaches of tri- butary creeks near the impoundments (p. E-3-438, Table E. 3.155).	This impact mechanism will receive further attention during impact assessment refinement (FY84 Task 3.1.3; FY85 Task 5).		Major ground activity will be prohibited near sensitive wildlife areas during sensitive periods (p. E-3-532 #10).
					Prohibition of access during construction, discouragement of off- road recreational vehicle activity, and phasing in of recrea- tional plan to limit recreational impacts on vegetation and wildlife (p. E-3-292 #15-17).
	(7) Increase in mortality due to hunting, trapping, and poaching.	Hunting and trapping can be regulated, but poaching losses may represent an unavoidable adverse impact (Table E.3.155).	Surveys of trappers are continuing to document current harvest levels (FY85 Task 20).		Use of project facili- ties or equipment by em- ployees and families for hunting and trapping will be prohibited (p. E-3-534 #14).
		•			If needed, recommenda- tions for restrictions to hunting regulations to reduce harvest pressure (p. E-3-534 #14).
(L) Red Fox	*(1) Habitat alterations due to impoundment clearing and re- claimed lands will increase prey availability.	Impact represents a bene- ficial effect on foxes (Table E.3.156).	Impact severity not suffi- cient to require further study.		Revegetation and ferti- lization of disturbed sites (p. E-3-526 #3).
	*(2) Open water downstream may hinder movements in winter.	Impact not quantified but not expected to be signi- ficant (Table E.3,156).	Impact severity not suffi- cient to require study.		Use of multilevel intake structures on the dams to maintain downstream river temperatures as close to normal as possible (p. E-3-526 #5).
	*(3) Habituation of foxes to human presence may lead to increase in mortality due to destruction of problem animals.	May represent an important impact on local fox popu- lations (p. E-3-440, Table E.3.156).	This impact mechanism will receive further attention during impact assessment refinement (FY84 Task 3.1.3; FY85 Task 5).		Education programs and strict garbage control measures and enforce- ment to prevent crea- tion of nuisance ani- mals (p. E-3-535 #15).
	*(4) Abandonment of some den sites may occur due to human disturbance.	Some negative effects may occur but habituation to human activities is very likely; impact not expected to be significant (p. E-3-439; Table E.3.156).	Surveys of fox den use in areas of potential impact (FY85 Task 26, subtask 3).	Collect information on fox den locations throughout construc- tion (p. E-3-524 #6).	Major ground activity will be prohibited near sensitive wildlife areas during sensitive periods (p. E-3-532 #10).
	×				

(I) Affected Species or Group	(II) Impact Mechanism	(III) Impact Assessment Status	(IV) Ongoing and ⁻ Planned Studies	(V) Proposed Monitoring	(VI) Proposed Mitigation Measures
(L) Red Fox	(5) Increase in mortality due to hunting, trapping, and poaching.	Hunting and trapping can be regulated, but poaching losses may represent an unavoidable adverse impact (p. E-3-439, Table E.3.156).	Surveys of trappers are con- tinuing to document current harvest levels (FY85 Task 20).		Use of project facili- ties or equipment by em- ployees and families for hunting and trapping will be prohibited (p. E-3-534 #14). If needed, recommenda-
					tions for restrictions to hunting and trapping regulations to reduce harvest pressure (p. E-3-534 #14).
(M) Marten, Weasel, and Lynx	(1) Permanent habitat loss for all species due to impoundments.	Impact will result in loss of habitat for probably all lynx (a few animals), approximately 100 marten, and approximately 5% of the population of weasels within the middle basin (p. E-3-440 to 442).	Continued surveys of furbearer distribution will improve impact assessment and mitigation planning (FY85 Task 26, subtask 1).		
	(2) Permanent loss of some habitat for marten and weasel due to the access corridor.	Impact will likely result in redistribution of home ranges of affected fur- bearers (p. E-3-487, Table E.3.157).	Impact severity not suffi- cient to require further study.		Habitat loss will be minimized by side borrow techniques for road construction, spoil deposition in impoundments or de- pleted borrow areas, and consolidation
÷ ÷					(p. E-3-526 #2). Minimize loss of forest areas through alignment of the access road and trans- mission corridor, and other measures (p. E-3-539 #23).
					Minimize loss and alteration of habitat, particularly less abundant habitats and sensitive wildlife habitats (pp. E-3-291 to 292 #1-11).
	*(3) Loss of habitat in impoundment areas due to clearing operations.	Short-term impact that will precede habitat loss due to impoundment filling (Table E.3.157).	Continued surveys of furbearer distribution will improve impact assessment and mitigation planning (FY85 Task 26, subtask 1).		Impoundment clearing will not begin until 2 or 3 years before filling; patches of vegetation will be left until just before filling (p. E-3-525 #1).

Page 35

(IV)(V)(VI)Ongoing andProposedProposedPlanned StudiesMonitoringMitigationMonitoringMeasures	(III) Impact Assessment Status	(II) Impact Mechanism	(I) Affected Species or Group
Previous studies have provided sufficient information for impact assessment. No further studies are planned.Selective clearing in the transmission corri- dor, permitting seral vegetation up to 10 ft in height (p. E-3-526 #4).	Impact will result in loss of 3831 acres of forest habitats useful to marten, lynx and weasels (Table E.3.86).	(4) Loss of forest habitats due to the transmission corridors.	(M) Marten, * Weasel, and Lynx
Minimize loss and alteration of habitat, particularly less abun- dant habitats and sensi- tive wildlife habitats (p. E-3-291 to 292 #1-11).			
Previous studies have provided sufficient information for impact assessment. No further studies are planned.Revegetation and ferti- lization of disturbed sites (p. E-3-526 #3) will provide some foraging habitat prior to forest succession.	Removal of 3341 acres of spruce forest habitats. Revegetation will pro- bably not return habitat to spruce communities during the license period (Table E.3.157).	* (5) Loss of habitat due to borrow sites and other areas that will be reclaimed.	2
This impact mechanism will receive further attention during impact assessment refinement (FY84 Task 3.1.3; FY85 Task 5).Clearing of impound- ments prior to flooding and removal of floating debris to reduce hazards to crossing (p. E-3-530 #9) will aid dispersal but will not completely mitigate barrier effects.	Redistribution of home ranges to conform to impoundment shores will occur (Table E.3.157).	* (6) Impoundments will block movements of marten and impede dispersal of weasels and lynx.	د
Impact severity not suffi- cient to require further study. Collect mortality data on road and railroad collisions (p. E-3-525 #1).	Impact not quantified but not expected to be signi- ficant (Table E.3.157).	* (7) Increase in the incidence of road kills due to presence of the access corridor.	د
Previous studies have pro- vided sufficient information for impact assessment. No further work is planned. Use of multilevel in- take structures on the dams to maintain down- stream river tempera- tures as close to normal as possible (p. E-3-526 #5).	Marten usually align home ranges along rivers and other water bodies. Impact not expected to be signifi- cant (Appendix EllJ, Volume 10B).	*(8) Open water downstream will block movements of marten.	
This impact mechanism will receive further attention during impact assessment refinement (FY84 Task 3.1.3; FY85 Task 5). a Major ground activity will be prohibited near sensitive wildlife areas during sensitive periods (p. E-3-532 #10).	Marten and weasel are unlikely to be affected, lynx are uncommon and will be able to avoid developed areas. Not expected to be a significant impact (Table E.3.157).	*(9) Avoidance of some areas near intense human activities (e.g., construction zones) due to disturbance, especially for lynx.	
Prohibition of access during construction, discouragement of off- road recreational vehicle activity, and phasing in of recrea- tional plan to limit recreational impacts on vegetation and wild- life (p. E-3-292 #15-17).			
during impact assessment refinement (FY84 Task 3.1.3; FY85 Task 5). Impact severity not suffi- cient to require further study. Collect mortality data on road and railroad collisions (p. E-3-525 #1). Previous studies have pro- vided sufficient information for impact assessment. No further work is planned. This impact mechanism will receive further attention during impact assessment refinement (FY84 Task 3.1.3; FY85 Task 5).	<pre>impoundment shores will occur (Table E.3.157). Impact not quantified but not expected to be signi- ficant (Table E.3.157). Marten usually align home ranges along rivers and other water bodies. Impact not expected to be signifi- cant (Appendix EllJ, Volume 10B). Marten and weasel are unlikely to be affected, lynx are uncommon and will be able to avoid developed areas. (I) Affected Species or Group	(II) Impact Mechanism	(III) Impact Assessment Status	(IV) Ongoing and Planned Studies	(V) Proposed Monitoring	(VI) Proposed Mitigation Measures
(M) Marten, Weasel, and Lynx	(10) Increase in mortality due to hunting, trapping, and poaching.	Hunting and trapping can be regulated, but poaching losses may represent an un- avoidable adverse impact (Table E.3.157).	Surveys of trappers are continuing to document current harvest levels (FY85 Task 20).		Use of project facili- ties or equipment by em- ployees and families for hunting and trapping will be prohibited (p. E-3-534 #14).
					If needed, recommenda- tions for restrictions to hunting and trapping regulations to reduce harvest pressure (p. E-3-534 #14).
(N) Raptors and Ravens	(1) Permanent loss of some nest sites and feeding habitat for bald and golden eagles, gos- hawks, ravens, and smaller raptors due to impoundments.	Some nesting locations of raptors on cliffs and large trees will be lost. Quanti- fication includes 7 of 16 known golden eagle, 4 of 8 bald eagle, 2 of 3 goshawk, and a considerable number of raven nesting locations that will be lost. Some hunting habitat will also be lost, although this is not expected to have a significant impact on any of the raptor species (pp. E-3-443 to 451, Table E.3.159).	Surveys to determine raptor cliff nest elevations and nest site use will be made in 1984 (FY84 Task 4.9.3). Food habits and foraging range of bald eagles will be studied. Information will be used for mitigation planning efforts to help determine the optimal locations of artificial eagle nests (FY85 Task 21).		Site enhancement and creation of artificial nesting locations for raptors (p. E-3-538 #21, Appendix 3.I).
	(2) Loss of one nesting loca- tion of bald eagle on Deadman Creek and some nesting loca- tions for ground-nesting raptors due to the access corridor.	The forest stand containing this nest is the best (and possibly only) bald eagle nesting habitat on Deadman Creek (p. E-3-489, Table E.3.159).	Previous studies have pro- vided sufficient information for impact assessment. No further work is planned.	Collect information on active raptor nest locations through- out construction (p. E-3-525 #9).	Raptor protection cri- teria (Table E.3.168). Changes in road align- ment to remain 0.5 miles from bald eagle nesting location (p. E-3-537, Figure E.3.81). Site enhancement and
					reation of artificial nesting locations for raptors (p. E-3-538 #21, Appendix 3.1).
	(3) Loss of nest sites due to impoundment clearing prior to flooding.	Three of the bald eagle and all of the goshawk nests are tree nests within the impoundment zone; they would be lost early due to impoundment clearing (Table E.3.159).	Surveys to determine bird activity at raptor nesting locations are planned (FY84 Task 4.9.3).		Impoundment clearing will not begin until 2 or 3 years before fill- ing; patches of vegeta- tion, including known nest trees, will be left until just before filling (p. E-3-515, E-3-525 #1).
					Site enhancement and creation of artificial nesting locations for raptors (p. E-3-538 #21, Appendix 3.I).

(I) Affected Species or Group	(II) Impact Mechanism	(III) Impact Assessment Status	(IV) Ongoing and Planned Studies	(V) Proposed Monitoring	(VI) Proposed Mitigation Measures
(N) Raptors and Ravens	(4) Loss of a golden eagle nesting location and a possible gyrfalcon nesting location due to borrow pits and reclaimed lands.	The golden eagle nesting location is within Borrow Site E (p. E-3-445, Table E.3.159).	Surveys to determine bird activity at raptor nesting locations are planned (FY84 Task 4.9.3).		Raptor protection cri- teria (Table E.3.168). Area where golden eagle nest is located will not be mined (p. E-3-537 #20).
					Changes in facility siting or alignment or in construction schedules to avoid disturbance to raptor nest sites (pp. E-3- 537 #20, E-3-533 #10). Site enhancement and
		· ·			creation of artificial nesting locations for raptors (p. E-3-538 #21, Appendix 3.I).
	<pre>*(5) Increase in electrocution of large raptors on trans- mission poles.</pre>	Impact difficult to quantify. Selected tower and line configuration for permanent transmission line is unlikely to cause electrocution. Electrocu- tion may occur on 34 kv construction transmission line. (p. E-3-497, Table E.3.159).	Previous studies provided sufficient information for impact assessment. No further studies are planned.		Use of pole/line con- figurations and other safeguards to prevent electrocution of rap- tors by temporary transmission lines (p. E-3-539 #22).
	*(6) Potential abandonment of several raptor and raven nests or nesting locations (including a peregrine falcon nest) due to human activities along the transmission corridor.	Impact not completely quantified but will affect at least 1 peregrine falcon and 2 gyrfalcon nesting locations if construction activities occur during nest site attendance periods (pp. E-3-452 to 454, Table E.3.159).	Surveys to look for and determine use of bald eagle and peregrine fal- con nest sites along the transmission corridor (FY85 Tasks 24 and 29).	Collect information on active raptor nest locations through- out construction (p. E-3-525 #9).	Raptor protection cri- teria (Table E.3.168). Changes in facility siting or alignment or in construction schedules to avoid disturbance to raptor nest sites (pp. E-3- 537 #20, E-3-533 #10).
	*(7) Detrimental impacts on salmon and other fish prey in downstream areas could affect bald eagle habitat quality.	Proposed mitigation of impacts to salmon should also lessen impacts on bald eagles. Not expected to be significant (Appendix EllJ, Volume 10B).	Surveys of bald eagle nest sites in downstream reaches are planned and will provide baseline population data for future monitoring studies (FY85 Task 27).		Impacts from decreased prey availability should be reduced by measures to mitigate impacts to salmon populations (p. E-3- 536 #16).

(I) Affected Species or Group	(II) Impact Mechanism	(III) Impact Assessment Status	(IV) Ongoing and Planned Studies	(V) Proposed Monitoring	(VI) Proposed Mitigation Measures
(O) Waterbirds	* (1) Permanent loss of river and stream habitats for waterfowl, shorebirds, dippers, and kingfishers due to impound- ments.	Numbers of birds affected have not been estimated but impact is unlikely to have a major effect on regional populations. Effects will be greatest on riverine species, particularly har- lequin duck, common and red-breasted mergansers, spotted sandpiper, semi- palmated plover, and dipper (pp. E-3-454 to 455).	Previous studies provided sufficient information for impact assessment. No further work is planned.		-
	<pre>*(2) Alteration of shoreline nesting habitats due to impoundment clearing and facility site clearing.</pre>	Temporary impact; in most areas preceding impoundment filling by 2 to 3 years (p. E-3-455).	Impact severity not suffi- cient to require study.		Habitat loss will be minimized by side borrow techniques for road con- struction, spoil deposi- tion in impoundments or depleted borrow areas, and consolidation of project facilities (p. E-3-526 #2). Design and alignment measures to minimize impacts on wetlands (p. E-3-292 #18, 19).
	<pre>*(3) Avoidance by waterbirds of areas of intense human activity (e.g., construction zones, impoundment clearing activities).</pre>	Impact not quantified, but not expected to be signi- ficant (pp. E-3-455, E-3- 491).	Impact severity not suffi- cient to require study.	Collect information on swan nest locations throughout construction (p. E-3-525 #10).	Aircraft will maintain minimum altitudes of 1000 ft above ground level during flights (p. E-3-531 #10).
					Aircraft will maintain a 0.25 mile buffer around lakes used by trumpeter swans during the nesting period (p. E-3-531 #10). Major ground activity will be prohibited within 0.5 miles of waterbodies used by swans when swans are present (p. E-3-532 #10).
					Prohibition of access during construction, discouragement of off- road recreational ve- hicle activity, and phasing in of recrea- tional plan to limit recreational impacts on vegetation and wildlife (p. E-3-292 #15-17).

(I) Affected Species or Group	(II) Impact Mechanism	(III) Impact Assessment Status	(IV) Ongoing and Planned Studies	(V) Proposed Monitoring	(VI) Proposed Mitigation Measures
(P) Other Birds	* (3) Loss of forested habitats for birds due to borrow sites and access corridors.	Loss included in figure for (P)(1) (p. E-3-496, Table E.3.165).	Previous studies provided sufficient information for impact assessment. No		Revegetation and fertili- zation of disturbed sites (p. E-3-526 #3).
			further studies prained.		Habitat loss will be minimized by side borrow techniques for road con- struction, spoil deposi- tion in impoundments or depleted borrow areas, and consolidation of project facilities (p. E-3-526 #2).
					Minimize loss of forest areas through alignment of access road and transmission corridor and other measures (pp. E-3-539 #23).
					Minimize loss and alter- ation of habitat, parti- cularly less abundant habitats and sensitive wildlife habitats (pp. E-3-291 to 292, #1-11).
	<pre>*(4) Avoidance of areas of intense human activity (e.g., construction zones, impound- ment clearing activities, recreational activities) due to disturbance.</pre>	Impact not quantified (p. E-3-460), but not expected to be significant for most species.	Impact severity not sufficient to require study.		Prohibition of access during construction, discouragement of off-road recreational vehicle activity, and phasing in of recrea- tional plan to limit recreational impacts on vegetation and wildlife (p. E-3-292 #15-17).
	*(5) Increase in breeding habi- tat for some species due to vegetation encroachment on downstream river floodplains.	Impact represents a bene- ficial effect on most birds (p. E-3-459).	Impact not sufficient to require study.	Collect data on changes in downstream vegetative cover (p. E-3-523 #2).	
	*(6) Increase in mortality due to collisions with transmis- sion lines and towers.	Impact difficult to prevent and population loss is usually insignificant (p. E-3-497).	Impact severity not suffi- cient to require study.		

(I) Affected Species or Group	(II) Impact Mechanism	(III) Impact Assessment Status	(IV) Ongoing and Planned Studies	(V) Proposed Monitoring	(VI) Proposed Mitigation Measures
(P) Other Birds	<pre>* (7) Loss of nest sites and habitat alteration due to secondary effects of erosion, blowdowns, etc., on forest vegetation.</pre>	Impact not quantified but not expected to be signi- ficant (Appendix EllJ, Volume 10B).	Impact severity not suffi- cient to require study.		
(Q) Small Mammals	(1) Permanent habitat loss due to impoundments and other permanent project facilities.	Habitats lost are identi- cal to those of birds [see Section (P)(1)]. Normally rapid population turnover rates and reshuffling of territories by small mam- mals will minimize imme- diate impacts; however, long-term loss of habi- tat will reduce overall regional populations (p. E-3-461).	Previous studies provided sufficient information for impact assessment. No further studies planned.		Selective clearing in transmission corridor, permitting seral vegetation up to 10 ft in height (p. E-3- 526 #4). Minimize loss and alter- ation of habitat, parti- cularly less abundant habitats and sensitive wildlife habitats (pp. E-3-291 to 292 #1-11).
	*(2) Increase in numbers of certain species in revegetated areas of reclaimed borrow sites.	Impact represents a bene- ficial effect on most small mammal species (p. E-3-462).	Impact severity not suffi- cient to require study.	· · · · · · · · · · · · · · · · · · ·	Revegetation and fertilization of disturbed sites (p. E-3-526 #3).
	*(3) Displacement during impoundment filling of small mammals that have recolo- nized disturbed areas in the impoundment clearing zone.	Temporary adverse impact, which resulted'from a previously beneficial effect on small mammal populations (Appendix EllJ, Volume 10B).	Impact severity not suffi- cient to require study.		Impoundment clearing will not begin until 2 or 3 years before filling; patches of vegetation will be left until just before filling (p. E-3-525 #1).
(R) Botanical Resources	(1) Permanent loss of vege- tation from impoundments, access roads, transmission line facilities, and other permanent facilities.	Permanent loss of approxi- mately 45,672 acres of primarily forest and shrub vegetation types (pp. E-3-225, 240, 243, 244 and 253, Table E.3.144).	1:63,360 scale vegetation mapping emphasizing under- story shrub species is cur- rently underway (FY84 Task 4.1.5) and is scheduled for completion in Jan. 1985 (FY85 Task 8). Mapping of wetlands is being conducted (FY84 Task 4.11.3) and planned for FY85 (FY85 Task 7). A literature review of habitat enhancement tech- niques is underway (FY84 Task 4.1.11) and field studies of disturbed areas are planned (FY85 Task 14). Identification of candi- date lands is underway (FY84 Task 4.1.12).		Mitigation plan pro- vides for minimization, rectification, reduc- tion, and compensation of impacts in a variety of ways (see pp. E-3-252 to 285). Minimize facility dimensions (p. E-3-291 #1). Consolidate structures (p. E-3-291 #2). Site facilities in areas of low biomass (p. E-3-291 #3). Site facilities to mi- nimize clearing of less abundant vegetation types (p. E-3-291 #4).

(I) Affected Species or Group	(II) Impact Mechanism	(III) Impact Assessment Status	(IV) Ongoing and Planned Studies	(V) Proposed Monitoring	(VI) Proposed Mitigation Measures
(R) Botanical Resources	(1) Permanent loss of vege- tation from impoundments, access roads, transmission line facilities, and other permanent facilities (cont.).				Site facilities to minimize clearing of vegetation types pro- ductive as wildlife habitat components (p. E-3-291 #5).
					Minimize volume re- quirements for borrow extraction (p. E-3- 291 #6).
					Disposal of spoil within the impound- ments or previously excavated areas (p. E-3-292 #7).
					Acquisition of replace- ment lands for imple- mentation of habitat enhancement measures (p. E-3-292 #12).
			•		Avoidance of the Prairie Creek, Stephan Lake, Fog Lakes, and Indian River areas by access routing (p. E-3-292 #14).
		•			Siting and alignment of all facilities to avoid wetlands to the maximum extent feasi- ble (p. E-3-292 #18).
					Agency coordination and participation in detailed engineering design and construc- tion planning of civil engineering measures to minimize potential wetlands impacts (p. E-3-292 #19).
					Minimize loss of forest areas through alignment of access road and transmission corridor and other measures (pp. E-3-539 #23, E-3-525 #1, E-3-526 #2).

P

(I) Affected Species or Group	(II) Impact Mechanism	(III) Impact Assessment Status	(IV) Ongoing and Planned Studies	(V) Proposed Monitoring	(VI) Proposed Mitigation Measures
(R) Botanical Resources	(9) Increased risk of fire from increased human popula- tions and easier access (cont.).				Public access to air- field prohibited during construction (p. E-3-534 #14).
	* (10) Alteration of vegetation due to flooding along impoundment shores and delta formation where creeks enter the impoundments.	Impact not quantified but not expected to be a sig- nificant loss; some altera- tion of vegetation types will occur (p. E-3-230).	Impact severity not suffi- cient to require study.		
	(11) Alteration of vegetation successional patterns in downstream floodplains due to flow regulation and resultant changes in stream morphology and ice scouring effects.	Impact not quantified and difficult to predict.	Continued refinement of downstream floodplain impact assessment will increase our understand- ing of effects on vege- tation (FY84 Task 4.2.4).	Collect data on changes in downstream vegetative cover (p. E-3-523 #2).	Development of moose- habitat model to yield better impact predic- tions and refinements to mitigation and com- pensation measuares (p. E-3-530 #7).
	* (12) Alteration of vegetation communities due to climatic changes near the reservoirs.	Effects would extend 2 miles from the reservoirs and would be most notice- able along the south shore of the reservoirs. Extent of effects on vegetation itself has not been quanti- fied (pp. E-3-236 to 237).	Spring 1983 plant phenology study will document physical and environmental variables affecting plant phenological development in and near the impoundment zones (FY84 Task 4.1.4). Impact mechanism will be addressed further through impact assessment refinement (FY84 Task 3.1.3; FY85 Task 5).	J	Use of multilevel intake structures on the dams to maintain downstream river tem- peratures as close to normal as possible (p. E-3-526 #5).
	*(13) Damage to understory vegetation from rime ice and hoar frost deposition caused by persistent fog banks near the reservoirs and open-water reaches downstream.	Impact not quantified, but rime icing will be limited to the immediate area around the spillways. Hoar frost is expected near open water but is not expected to be a significant nega- tive impact (pp. E-3-236 to 237).	Impact mechanism will be addressed and clarified through impact assessment refinement (FY84 Task 3.1.3; FY85 Task 5).	Collect data on changes in downstream vegetative cover (p. E-3-523 #2).	
	<pre>*(14) Increase in damage and alteration of vegetation communities due to increase in use of off-road vehicles near project facilities.</pre>	Impact not quantified (pp. E-3-237 to E-3-238).	This impact mechanism will receive further attention during impact assessment refinement (FY84 Task 3.1.3; FY85 Task 5).	Monitor progress of rehabili- tation to identify locations requiring further attention (p. E-3-292 #11).	Development of a com- prehensive site reha- bilitation plan (p. E-3-292 #10). Planning and develop- ment of an environ- mental briefings program for all field personnel (p. E-3-292 #13). Restriction of public access during construc- tion by gating the access road (p. E-3-292 #15).

.

(I) Affected Species or Group	(II) Impact Mechanism	(III) Impact Assessment Status	(IV) Ongoing and Planned Studies .	(V) Proposed Monitoring	(VI) Proposed Mitigation Measures
(R) Botanical * Resources	(14) Increase in damage and alteration of vegetation communities due to increase in use of off-road vehicles near project facilities (cont.).				Use of signs and possi- bly regulatory desig- nations and measures to discourage use of ORVs and ATVs (p. E-3-292 #16).
					Phased implementation of the project Recrea- tion Plan with inter- agency review and con- currence (p. E-3-292 #17).
					Public access to air- field prohibited during construction (p. E-3-534 #14).
*	(15) Removal of overstory vegetation in forested por- tions of the transmission line corridor.	Will result in removal of approximately 6041 acres (2557 from Healy to Fairbanks, 1702 from Healy to Willow, 1274 from Willow to Cook Inlet, 46 from Watana to Devil Canyon, and 462 from Devil Canyon to Gold Creek) of habitats containing trees, changing these areas to shrub or tundra vegetation types (p. E-3-244, Tables E.3.79, 80, and 86; Supplemental Infor- mation Response to FERC Request 3B-7).	This impact mechanism will receive further attention during impact assessment refinement (FY84 Task 3.1.3; FY85 Task 5).	Restriction of tree removal to areas beneath the trans- mission lines for access to the corridor, and removal of trees which could fall on lines or guy wires.	Site facilities to minimize clearing of vegetation types pro- ductive as wildlife habitat components (p. E-3-291 #5). Design transmission corridors to allow selective cutting of trees and to accommo- date uncleared low shrub and tundra vege- tation within rights- of-way (p. E-3-292 #8). Selective clearing in transmission corridor, permitting seral vege- tation up to 10 ft in
					height (p. E-3-526 #4). Development of moose- habitat model to yield better impact predic- tions and refinements to mitigation and com- pensation measures (p. E-3-530 #7).
	(16) Blockage of sediment tra- vel by the impoundments may increase erosion downstream, affecting vegetation on islands in the floodplain.	Impact not quantified.	Refinement of downstream impacts (FY84 Task 4.2.4) will better enable pre- diction of erosion effects.	Collect data on changes in downstream vegetative cover (p. E-3-523 #2).	

(I) Affected Species or Group	(II) Impact Mechanism	(III) Impact Assessment Status	(IV) Ongoing and Planned Studies	(V) Proposed Monitoring	(VI) Proposed Mitigation Measures
(R) Botanical Resources	*(17) Potential removal or alteration of habitats for endangered plant species.	Impact not quantified. No such species have been found in surveys to date (p. E-3-197).	Previous studies provided sufficient information for impact assessment. No further studies planned.		Site facilities to minimize clearing of less abundant vegeta- tion types (p. E-3- 291 #4).
					Design transmission corridors to allow selective cutting of trees and to accommo- date uncleared low shrub and tundra vege- tation within rights- of-way (p. E-3-292 #8).
					Use of signs and possibly regulatory designa- tions and measures to discourage use of ORVs and ATVs (p. E-3-292 #16).
	* (18) Leaching of potentially toxic heavy metals, such as mercury, from flooded soils and vegetation into the reservoir impoundment.	Impact not quantified. Primarily affects preda- tory fish, and tertiary consumers.	A literature search and analysis of the potential for leaching from soils and vegetation into impoundments (Aquatic FY85 Task 51).		
(S) All Species	*(1) Changes in local climate (air temperatures, precipi- tation, etc.) may have subtle direct effects on distribution or habitat use by wildlife and more profound effects on vege- tation, which in turn may affect wildlife use of the area.	Impact not quantified but unlikely to extend more than 2 miles from the reservoirs (pp. E-3-236 to 237).	Impact mechanism will be addressed during impact assessment refinement (FY84 Task 3.1.3; FY85 Task 5).	Collect data on changes in downstream vegetative cover (p. E-3-523 #2).	
	(2) Minor or insignificant impacts may prove to be major impacts when considering the cumulative effects of all project facilities and the impact of nearby developments on wildlife and their habitats.	Cumulative impacts are not quantified but may constitute some significant impacts (pp. E-3-499 to 507).	Further analysis of cumula- tive impacts is being addressed during impact assessment refinement (FY84 Task 3.1.3; FY85 Task 5).

REFERENCES

The citations in the matrix differ from the standard citations used in reports. This has been done to save space, because there is repeated reference to a few reports by the same authors.

The license application has been cited repeatedly. It is the following document:

Alaska Power Authority. 1983. Before the Federal Energy Regulatory Commission. Application for License for Major Project. Susitna Hydroelectric Project. Anchorage. 13 volumes.

It is not referred to specifically, but page references of the form p. E-3-532 (as well as references to Tables such E.3.168, Figures such E.3.81, and Appendices EIIJ or 3.1) all refer to the license application.

Ongoing and planned studies are taken from two reports that outline plans of study for the fiscal years 1984 and 1985. These reports are cited as "FY84" and "FY85" in the matrix. The reports are the following:

Harza-Ebasco Susitna Joint Venture. 1984. Susitna Hydroelectric Project. Terrestrial programs. Fiscal year 1984 detailed plan of study. Doc. No. 1190. Prepared for Alaska Power Authority. Anchorage.

Harza-Ebasco Susitna Joint Venture. 1984. Susitna Hydroelectric Project. Draft terrestrial plan of study. Fiscal year 1985. Doc. No. 1119. Prepared for Alaska Fower Authority. Anchorage. 92 pp. Two other plans of study and one report have been referenced infrequently. "Aquatic FY85" refers to:

> Harza-Ebasco Susitna Joint Venture. 1984. Susitna Hydroelectric Project. Draft aquatic plan of study. Fiscal year 1985. Doc. no. 591. Prepared for Alaska Power Authority. Anchorage.

"Social Science FY85" refers to:

Harza-Ebasco Susitna Joint Venture. 1984. Susitna Hydroelectric Project. Draft social science program study tasks. Fiscal year 1985. Prepared for Alaska Power Authority. Anchorage.

"Supplemental Information Response to FERC Request 3B-7" refers to:

> Alaska Power Authority. 1983. Responses to FERC supplemental information request of April 12, 1983. Filed with FERC July 11.
