INTRODUCTION

Surveys of communities that are expected to be significantly affected by the construction and operation of the Susitna Hydroelectric Project were conducted as part of the Social Sciences Program to support the needs of the Alaska Power Authority. At present, the communities expected to be significantly affected by the construction and operation of the dam do not have much reported baseline economic and demographic information. In order to profile the communities and determine how they would respond to changes both before and during the construction and operation of the dam, a time-series data base on community trends is being developed to support the basis upon which impact projections are made. This household survey is designed to obtain information on demographic characteristics, employment, length of residency, housing characteristics, satisfaction with public services and facilities of residents living in Trapper Creek, and use by residents of fish and wildlife resources.

1.0 SUMMARY DISCUSSION OF MAJOR FINDINGS

Surveys of households in Trapper Creek were conducted during the period October 26, 1983 to November 2, 1983. An estimated 69 housing units existed in the survey defined area of Trapper Creek at that time. A total of 27 housing units were identified in the canvassed primary and secondary blocks of which 23 were successfully canvassed. Of the 23 housing units successfully canvassed, 3 were determined to be vacant and interviews were conducted with the remaining 20 households. An estimated 33 percent of the 60 households in the survey defined area of Trapper Creek were interviewed.

- A summary of demographic characteristics for Trapper Creek residents shows: 1) an estimated population size of 196 people in the survey defined area; 2) an estimated average age for adults of 40.7 years old; 3) an estimated sex distribution for the adults in the sample of 54 percent male and 46 percent female; 4) zero percent of the adults sampled belong to a Native organization; 5) about 85 percent of the sample households contained married heads of household with the spouse present; 6) an estimated average household size of 3.2; and 7) about 0.95 school-age children (5 to 17 years old) per household in the sample.
- A summary of economic characteristics for Trapper Creek residents shows that: 1) 71 percent of all adults were in the labor force; 2) approximately 56 percent of all adults were either employed or selfemployed; 3) the unemployment rate at the time of the survey was between 20 and 21 percent; 4) the largest industry sectors in terms of employment were federal, state and local government (slightly higher than 29 percent), construction (18 percent), and agriculture, forestry, and commercial fisheries (15 percent); and 5) 50 percent of presently employed and recently unemployed adults in the sample at the time of the survey worked in the Mat-Su Borough, about 15 percent of the sample worked in Anchorage, about 3 percent worked on the North Slope, and 32 percent worked elsewhere.
- A summary of housing characteristics for Trapper Creek residents
 shows that: 1) 75 percent of the interviewed households lived in

owner-occupied dwelling units; 2) 95 percent of all surveyed households lived in single-family dwelling units and 5 percent lived in duplexes; and 3) the overall vacancy rate for the 27 housing units in the sample blocks was about 11 percent.

0

- About 80 percent of all replies received from Trapper Creek residents to questions about attitudes toward available public facilities and services in the community were classified as very satisfied or satisfied. For individual services, residents were most satisfied with ambulance (100 percent favorable), the road system (95 percent favorable), and schools (83 percent favorable). Residents expressed the most dissatisfaction with indoor recreation facilities (11 percent unfavorable) and the lack of medical services in the community besides ambulance (11 percent unfavorable).
- o Forty-five percent of the respondents lived outside Alaska prior to moving to Trapper Creek. Former Anchorage households made up forty percent of the Trapper Creek households in the sample. Frequently cited reasons for moving to Trapper Creek were to enjoy the quality of life (about 32 percent), and the availability of land (21 percent).
- Trapper Creek residents rely upon fishing and hunting for recreation 0 and food. Approximately 53 percent of the population fishes and 42 percent hunt. Of the 16 sample households that fished, no more than 56 percent fished for any one species in the area that may be affected by the Susitna Hydroelectric Project. Twenty-eight percent of the total 510 person-days spent fishing by Trapper Creek residents in the sample occurred in this area. Of the 16 sample households that hunted, none spent any time in Area 2 during the last year (refer to Maps in Appendix B). In Area 1, nine households hunted moose, 3 households sought ptarmigan, and 2 households went after black bear. Forty-six percent of the 427 person-days spent hunting by Trapper Creek residents in the sample occurred in Area 1. Nine percent of Trapper Creek residents trap. Eighty-six of the 345 person-days spent trapping occurred in areas that may be impacted by the Susitna Hydroelectric Project.

2.0 APPROACH AND METHODOLOGY

2.1 OVERVIEW

2

A number of steps were taken to determine the approach and methodology for the household survey in Trapper Creek. First, the major objectives and specific types of information needed to update the socioeconomic projections were identified. Next, a review of the literature on surveys was conducted. Third, the definitions of the populations for each of the three communities were determined.¹

A sampling frame and sampling methodology were selected.² The questions to be included in the interviews were then developed in conjunction with the formatting of the questionnaire. Finally, an interviewer guide was developed which laid out general guidelines for the interviewers and instructions on specific questions.

The questionnaire was extensively reviewed internally as well as by the Alaska Department of Community and Regional Affairs, the Alaska Department of Fish and Game, the Mat-Su Borough Planning Department, and Charlotte Thomas, an independent consultant. The survey instrument went through several iterations to reflect those review comments.

- In statistical theory, the population refers to the total universe of "data elements' about which the researcher wishes to generalize. In this case, the population refers to the households located, at the time of the survey, within specific geographic boundaries.
 - A sampling frame is the comprehensive listing, of the population, from which the sample was chosen.

2.2 OBJECTIVES

The survey program was developed with the general objective that the results would enhance the following socioeconomic program activities:

- 1. Updating the data and assumptions on local baseline conditions.
- Providing supplementary data that the Federal Energy Regulatory Commission requested after reviewing Exhibit E of the License Application for the Susitna project.
- 3. Refining and expanding the socioeconomic impact mitigation program and plan.
- 4. Comparing baseline data with information to be collected later as part of the socioeconomic impact monitoring program.

In addition, the project team adopted the following objectives relating to the design of the survey:

- 1. A methodologically sound approach that takes into account the rural nature of the area.
- 2. A data collection listing which is consistent to and complementary with other efforts/data bases such as the annual survey of population and housing conducted by the Mat-Su Borough Planning Department.
- 3. A survey instrument that can be used throughout project planning and construction.
- 4. A design that will facilitate tabulation.

The project team reviewed literature pertaining to statistical theory, sampling methodologies, the advantages and disadvantages of alternative

Page 5

interview approaches, question formulation, questionnaire design, tabulation systems, and analytical techniques. In addition, the methodologies used in other surveys in Alaska were reviewed, including an Institute of Social and Economic Research survey used for the Tetrachemical Study in the Mat-Su Borough. Contacts were also made with individuals who have experience in conducting formal survey efforts in Alaska. Individuals contacted included Steve Langdon of the University of Alaska, Jack Kruse of the Institute of Social and Economic Research, and Don Dillman of Washington State University.

2.3 SAMPLING TECHNIQUE

Some of the considerations taken into account during this analysis included:

- The need for a relatively large sample because of the small size of the population.
- 2. The significant percentage of residents in the northern part of the Mat-Su Borough that do not have phones.
- 3. The low density of housing units in many areas, and the significant percentage of residents that live away from direct road access.
- 4. The need for a high response rate, to avoid a skewed or unsuccessful survey.

It was believed that a representative sample of the preliminary population could best be obtained by using a face-to-face approach. Faceto-face approaches typically provide high response rates. In Trapper Creek, the only disadvantage of using a face-to-face interview approach was that the population was dispersed. There were significant numbers of residents living away from the roads and there is no defined core for the community. The Trapper Creek area was defined as the corridor along Petersville Road between the Peters Creek area and the Susitna River.

Page 6

2.3.1 Sampling Frame

(second

A2000)

100 Par.

The Mat-Su Borough Assessor's records of housing units, reported in an array by township-range-section-parcel, were selected to be the sampling frame for the survey in Trapper Creek. This sampling frame was consistent with the annual survey of population and housing conducted by the Mat-Su Borough. It was considered to provide a representative sampling frame for the northern part of the Mat-Su Borough; other possible listings, such as the phone book and voters registration records, were less comprehensive and would not provide a valid basis for the sampling. The Borough does not require building permits for housing units, so an upto-date listing for housing units was not available.

The use of assessment records has the following limitations:

- 1. Some housing units are vacant.
- Assessment records may be up to a year old, depending upon where the borough is in the cycle of field work at the time the computer run was conducted.
- 3. Mobile homes are sometimes recorded as personal property rather than real property and thus are not included on the real property assessment records.
- 4. Structures are classified by principal use; therefore, residences which are within or above commercial buildings are not identified on the computer record.

To compensate for the two most important of these limitations (#2 and #3), the sample was drawn in blocks. The interviewers were instructed to interview all housing units in the block, even if this unit did not appear on the assessment records. In order to limit the amount of time spent trying to locate residents in households that may not be occupied, the interviewers were instructed to attempt to contact a household up to

three times, and then to list the unit as vacant or not-at-home, as appropriate. To facilitate the call-back process, a card was used by the interviewer that specified the next time a call would occur. If the respondent would not be home at that time, he or she was asked to state on the call-back card when they would be available and to leave the card out upon the interviewer's second call-back.

2.3.2 Sample Selection

A sample size of 30 percent of the housing units listed in the Assessor's was established. The sample selection process used was similar to the process used by the Mat-Su Borough in its annual population surveys. The communities were divided into blocks (census blocks, when these were delineated on the maps provided by the Mat-Su Borough), the blocks were each assigned a number, and a sample of blocks was chosen using a random sample technique, as described below. All housing units in the designated blocks on the list were canvassed, in the block order listed.

A target number of successfully canvassed housing units was developed for each community. The primary blocks selected for each community contained more than the required 30 percent of housing units, in order to allow for unsuccessful interviews. However, a procedure was developed for canvassing secondary blocks in case the required number of successful interviews was not obtained.

If the interviewer was unable to meet the target number of households from within the primary block listings, for any of the reasons listed below, the interviewer was directed to canvass secondary blocks until the target was reached.

A housing unit was considered to be successfully canvassed if:

- 1. An interview occurred.
- 2. The unit was identified as vacant by a neighbor.
- 3. The interviewer attempted to call on the housing unit three times, at different times of day, was not able to find anyone at home and there was no evidence that the unit was currently occupied.

A housing unit was considered not successfully canvassed if:

- 1. The household declined to be interviewed.
- 2. The housing unit could not be located.
- 3. It was impossible to gain access to the housing unit.
- 4. It was clear that someone was living at the residence, even though 3 calls at the household were not sufficient to find a resident at home.

In Trapper Creek, the population is distributed in a long corridor along the Petersville road, and it was believed by the study team that residents' occupations and lifestyles may differ in different parts of the corridor. For instance, persons operating businesses may tend to live near the junction of the Parks Highway and Petersville road, while miners and trappers may tend to live farther west along the Petersville road. For this reason, the sample in Trapper Creek was chosen using a systematic sampling technique. The first block was chosen randomly, and every third block was chosen thereafter.

In the course of the fieldwork, it became clear that two of the blocks farthest out the Petersville Road, to the west, would not be accessible by use of a four-wheel drive vehicle, due to snow. These were treated as unsuccessful canvasses, and a secondary block on Oilwell Road was canvassed instead. The survey-defined area of Trapper Creek included all of the housing units within a quarter of a mile from the Petersville Road between the Peters Creek area to the Susitna River, all housing units within a quarter of mile of Oilwell Road on the portion that extends south for six miles from the Petersville Road, and all housing units in the Trapper Creek subdivsion.

Based upon conversations with local residents, it is believed that the substitution has skewed the sample slightly, and that the major effect of the substitution will be on the categorization of occupations in the community (as indicated above, a larger proportion of miners and trappers are believed to live farther west). In other respects, the population is considered to be sufficiently homogenous so that the representativeness of the sample will not be undermined.

2.3.3 The Questionnaire

1990 - 199

; Ceensi The survey instrument is 20 pages long. Four hand-out sheets were used to facilitate understanding of questions about employment status, industry of the employed, occupation, and attitudes about public facilities and services, and two maps were used to assist respondents in answering questions dependent upon geographic areas (most notably, questions pertaining to hunting, fishing, and trapping). A copy of the survey instrument is provided in Appendix B.

The field work was conducted between October 26, 1983 and November 2, 1983. The Trapper Creek interviewers completed 20 interviews in that time. The interviewers were familiarized with the substantive aspects of this questionnaire and reviewed basic interviewing techniques. In addition, these interviewers were given a written set of guidelines to follow should specific situations or questions arise. This information is contained in Appendix C.

The survey instrument was pre-tested in Cantwell on October 21-22, 1983. It was tested for its clarity, consistency, and logic of question ordering. It was also tested on Native and non-Native respondents and young and elderly residents to ensure comprehension by all of the respondents who were likely to be included in the sample. Modifications to the questionnaire were made as a result of the pre-test.

Completed questionnaires were checked each night for data problems or inconsistencies by the community interviewers.

3.0 ANALYSIS OF RESULTS

3.1 INTRODUCTION

,eina

Several conventions are followed throughout the analysis section to allow the reader quick and easy reference to the tables in Appendix A. Tables in the appendix are ordered in a sequence that corresponds to the way in which the questions appear in the survey instrument. Some responses will not appear in the appendix. Those responses not appearing at this time were not included because either they were contingent or secondary questions that received few responses or they are already incorporated in the text. Tables that appear in the text were referenced to a question that appears in the survey instrument. The instrument is presented as Appendix B.

Responses to the survey questions allow the researcher to derive sample statistics such as means or proportions. These statistics are used to generalize from the sample to the entire population. Sample statistics provide a point estimate of the true population parameter. However, due to sampling error, it would be an exceptional coincidence if the point estimate provided by the sample statistic were identical to the population parameter. A major weakness of point estimates is that they do not permit any expression of uncertainty about the sample statistic's ability to estimate the population parameter of interest. Uncertainty about estimating ability requires a procedure that calculates an interval about which one has a degree of certainty that the true population parameter is contained within a specified range.

Construction of confidence intervals was the technique employed to provide a degree of certainty about the sample statistic's ability to estimate the population parameter. The intervals are created about the sample statistic and require information about the probability of error that one is willing to accept, the size of the sample, the sampling distribution, and the sample statistic used as an estimator. Smaller sample sizes, extreme values in the distribution of observations, and acceptable risks of error no larger than 10 percent led to several confidence intervals that were quite large for some of the sample statistics.

In calculating confidence intervals, the researcher determines the risk of error that is acceptable for the purposes of the research. A five percent probability of error that intervals constructed will not contain the true population parameter value is typically selected. Confidence levels are defined as one minus the probability of error. In this case, a 95 percent confidence interval procedure would be used. Construction of intervals using 95 percent confidence levels implies that in 95 out of 100 samples of the same size, the intervals constructed about the sample statistics would be expected to contain the population parameter value. In the other five intervals, the population parameter value would lie outside the interval constructed. In other words, by using this procedure we would be assured that the probability of any interval containing the population parameter value is 95 percent.

3.2 SURVEY RESULTS

3.2.1 Demographic Characteristics

Demographic characteristics that profile the population consist of age, sex, race, relationship to head of household, marital status, household size, number of school-age children, and size of the population.

<u>3.2.1.1 Age</u>. According to Table 1, children in Trapper Creek made up 35 percent of the persons in households while the elderly (65 or more years old) accounted for about 3 percent of the sample. The elderly proportion was smaller than the 4 percent estimated for the entire Mat-Su Borough during 1982. The proportions of children and elderly in the Trapper Creek population were comparable to those of the State. Recent State estimates (1982) show these proportions to have been 30 to 35 percent and 3 percent, respectively. Mean age of the sample was 30.1 years while the

median was 30 years. Similar values for the mean and median imply that the distribution of ages for the sample approximates a bell-shaped curve. In 1982, average age in Alaska was 27.6 years.

Adult inhabitants ranged in age from 18 years old to 67 years old. The median age of adults was 41 years old, and the mean age was slightly less.

-

P

	Frequency	Distribution	
Age	Number	Percent	
0 - 4	3	4.8%	
5 - 13	· 11	17.5%	
14 - 17	8	12.7%	
18 - 19	1	1.6%	
20 - 29	6	9.5%	
30 - 39	12	19.0%	
40 - 49	12	19.0%	
50 - 64	8	12.7%	
65 +	2	3.2%	
	63	100.0%	
Median = 30.0			
Mean = 30,1	. · ·		

Table 1 Age Distribution of Sample Residents

Source: (Q27), Frank Orth & Associates, Inc., 1984.

<u>3.2.1.2 Sex</u>. About 54 percent of the adults in the sample were male, and about 46 percent were female. The percentage of males in the 1982 State of Alaska population was between 52 and 53 percent. The true proportion for males, using a 95 percent confidence interval about the mean, would lie between 38 and 69 percent.

3.2.1.3 Member of Native Corporation. Zero percent of the adults were members of a Native organization.

3.2.1.4 Household Relationships and Marital Status. About 49 percent (20) of the 41 adults in the sample stated that they were the head of household, about 42 percent (17) were defined as spouses of the head of household, about 7 percent (3) were classified as children of the head of household, and the remaining 2 percent (1) of the sample were classified as "other." The average age of heads of household was slightly over 45 years old. Comparing the age of heads of households to all adults in the sample shows that heads of household were four years older than the average age for all adults. The defined heads of household in Trapper Creek were estimated to be 90 percent male (18) and 10 percent female (2).

pierro,

, 199

.

The responses to questions about relationship to head of household indicated slightly more than 82.9 percent of the adults in the sample were married and living with their spouses. A 95 percent confidence interval about the sample proportion is between 71 percent and 95 percent.

3.2.1.5 Household Size. Trapper Creek had an average household size of 3.2 persons per household compared to the statewide average household size in 1980 of 2.93. The number of adults per household in Trapper Creek was estimated at 2.1.

<u>3.2.1.6 School-Age Children</u>. There were approximately 1.1 children per household in the sample. In total, the sample population was composed of about 5 percent pre-school children, about 17 percent primary school-age children, and about 13 percent secondary school-age children. Primary school-age children represented 58 percent of total school-age children in the community.

The proportions of children per household were extended to the total estimated number of households that exist in the survey-defined area of Trapper Creek (61 households) to yield estimates of the total number of children in the community: 9 pre-school children, 34 primary school-age children, and 24 secondary school-age children. It was not possible to check these numbers against school enrollment figures since the surveydefined area of Trapper Creek represents only a portion of the area that is included in the local school district.

<u>3.2.1.7 Population</u>. There were 66 housing units in the survey-defined area of Trapper Creek during 1982. Based on 1983 survey results, the total was adjusted to 69 housing units in 1983. A vacancy rate of 11.1

percent was determined from sample results. The October vacancy rate was considered to be an approximate average for the year since, during the summer, many seasonal job holders and householders are present in the area causing vacancy rates to be lower than in October and, during January, those same seasonal jobholders and householders usually leave the area, causing the vacancy rates to be higher in the area. Therefore, an overall occupancy rate for the community of 88.9 percent is considered accurate.

Multiplying the 69 housing units by the occupancy rate yields an estimated 61 occupied households in the community. Multiplying the number of households by the estimated average household size of 3.2 yields an estimated population of 196 people in the survey-defined area of Trapper Creek.

3.2.2 Economic Characteristics

Economic characteristics that profile the population consist of employment status, occupation status, industry of the employed, occupation of the unemployed, and the location of jobs. In addition, several characteristics can be combined from the household and business surveys to provide information on employment by place of work versus employment by place of residence, and commuting patterns.

<u>3.2.2.1 Employment</u>. All the adults in the sample were asked to describe their current employment status. According to Table 2, about 71 percent (29) of adults in the sample out of the 41 respondents described themselves as in the labor force which includes both employed and unemployed persons. Of the 29 adults, more than 79 percent were currently employed (or self-employed) and about 21 percent were unemployed but actively seeking work. Retired adults made up about 10 percent of the sample, homemakers made up over 12 percent of the sample, students accounted for over 2 percent of the sample, and inactive unemployed accounted for about 5 percent of the respondents.

Category	Frequency Number	Distribution Percent
Employed or Self-Employed	23	56.1%
Retired	4	9.8%
Unemployed (Active)	6	14.6%
Unemployed (Inactive)	2	4.9%
Homemaker	5	12.2%
Student	1	2.4%
	41	100.0%

Table 2 Employment Status

3.2.2.2 Hours Worked Per Week. Of the 34 respondents who answered this question, almost 80 percent were considered to be employed full-time. Full-time employment is defined as working at least 35 hours per week. About 12 percent worked less than 20 hours per week. Adults working between 30 and 34 hours accounted for 8 to 9 percent of the sample. Results appear in Table 3.

Table 3 Hours Worked Per Week

NUMBEL	C P I C P I I
2	5.9%
2	5.9%
3	8.8%
27	79.4%
34	100.0%
	2 2 3 <u>27</u> <u>34</u>

<u>3.2.2.3 Occupation and Industry</u>. The primary occupation of adult respondents was placed into categories used by the Alaska Department of Labor. As shown in Table 4, between 23 and 24 percent (8) of the respondents were classified as professional, technical, and managerial workers and about 18 percent of the respondents were in machine trades.

Category	Frequency Number	Distribution Percent
Professional, Technical, & Managers	8	23.5%
Clerical Workers and Sales Persons	2	5.9%
Service Workers	4	11.8%
Agriculture, Fishery and Forestry	4	11.8%
Machine Trades	6	17.6%
Structural	4	11.8%
Benchwork	1	2.9%
Mining	3	8.8%
Miscellaneous	$\frac{2}{34}$	<u> </u>

Table 4 Primary Occupation

Source: (Q31), Frank Orth & Associates, Inc., 1984.

Secondary skills held by Trapper Creek residents were weighted toward the professional, technical, and managerial group (about 27 percent), service occupation groups (about 20 percent), and the structural trades (about 20 percent). Representing about 7 percent each of the 15 responses received to this question were the agriculture, fishery, and forestry occupations, machine trades, and clerical trades. Thirteen percent had their second-ary skills classified as miscellaneous.

Respondents were asked to identify the name of the establishment that they presently or most recently worked for. The establishments were subsequently classified into industry categories that are used by the Alaska Department of Labor. The largest industry sector is government, accounting for over 29 percent (10) of the labor force. Construction, at about 18 percent (6) of the 34 respondents, was the second largest sector in the community. Agriculture, forestry, and commercial fisheries accounted for about 15 percent (5) of the recent employment in the sample. The mining sector at 12 percent (4) of total recent employment was the fourth largest sector in the community. <u>3.2.2.4 Location of Employment</u>. According to Table 5, about 44 percent of the 34 currently and recently employed residents in the sample said that their job was located within 10 miles of their residence. Close to 6 percent had jobs in other locations in the Mat-Su Borough. Almost 15 percent had jobs that were located in Anchorage and 3 percent worked on the North Slope. Over 32 percent of the respondents stated that they worked in other locations besides the ones that have already been mentioned.

Table 5 Location of Principal Job

Category	Frequency Number	Distribution Percent

<u>3.2.2.5</u> Business Ownership. Slightly more than 40 percent of all adults in Trapper Creek owned a business. Many of these businesses were in the services sector and the retail trade sector. They included repair services, lodges, and guiding services. In addition, retail trade business types consisted of taverns, crafts establishments, and trading posts.

3.2.2.6 Seasonality of Employment. The number of full-time employed adults varied from about 40 percent of the total 42 adults in August and September to 62 percent in April during 1983, as shown in Table 6. Comparing the peak and valley months of full-time employment during 1983 with average employment of about 21 adults shows that seasonal variations have ranged from 124 percent of average to as low as 81 percent.

Seasonality of Baseline Full-time Employment Patterns in Trapper Creek (As a Percent of All Adults and As a Percent of Average Full-time Employment)

Table 6

N = 42

3.2.2.7 Estimate of Total Employment in the Community. It was estimated that 1.15 adults per household are employed on average (23 employed residents divided by 20 households). Multiplying this by the estimated 61 occupied households in the survey defined area yields a total of 70 employees by place of residence. Place of work estimates can be obtained by adding the responses to employment from surveys of businesses, the public sector, and the Intertie construction worker survey. Place of work estimates for Trapper Creek are 41 jobs. Since over 44 percent of all residents work within 10 miles, 31 of the 70 employees by place of residence were estimated to work in Trapper Creek. Thirty-nine commuted to jobs outside the area. Of the 41 jobs in Trapper Creek, 31 belonged to Trapper Creek residents and 10 were estimated to belong to nonresidents. <u>3.2.2.8 Transportation And Travel</u>. Information about travel behavior and preferences for commuting were obtained from respondents. Using the approximate mid-points of each classification in the frequency distribution tables, it was possible to develop an estimate of the amount of time respondents were spending traveling to work and the amount of time they were willing to spend traveling to work. The majority of respondents have been spending about 30 minutes per day traveling in their current or most recent job, according to Table 7.

	Ta	ble 7	· .	
Average	One-Way	Daily	Commute	Time

1 1 1

> An average of 5.5 round trips to work were made each week by residents of Trapper Creek, according to Table 8. Several respondents used more than one mode of transportation to get to work. The preferred mode of transportation to work was use of a personal motor vehicle. Eighty-one percent (22) of the 27 respondents use such transportation to get to work, 19 plus percent (5) travel on foot or use a bicycle to get to their place of employment, and 22 percent (6) go to work by plane. The latter responses included 2 miners, 2 construction workers, 1 North Slope worker, and one real estate investor.

	Frequency Distribution

Six	5	21.7%
Seven Or More	7	.30.4%
	23	99.8%

Table 8 Number of Round Trips to Work Per Week

Source: (Q53), Frank Orth & Associates, Inc., 1984.

On average, respondents were willing to travel up to 1 hour and 26 minutes a day to get to and from work. In jobs that require only one round trip per week, respondents would be willing to travel about 4 hours and 5 minutes each way to their job.

3.2.3 Housing Characteristics

N.C.S.M

48500

Housing characteristics of interest in the survey include home ownership patterns, dwelling unit types, vacancy rates, and information on housing stock characteristics. A total of 20 responses were possible for household characteristics.

<u>3.2.3.1 Type of Structure</u>. Housing unit types were tabulated for households with which interviews were conducted. Results appear in Table 9. Of the 20 responses to this question, 95 percent (19) of the households were living in single-family dwelling units, and 5 percent resided in duplexes.

Category	Frequency Number	Distribution Percent
Single Family	19	95.0%
Duplexes	$\frac{1}{20}$	$\frac{5.0\%}{100.0\%}$

Table 9 Housing Type

3.2.3.2 Ownership Characteristics. Seventy-five percent of the 20

households interviewed owned the dwelling unit that they lived in, while 25 percent of the adults in households were renters. A ninety-five percent confidence interval about the sample proportion for ownership implies that the true proportion would lie between 56 and 94 percent.

<u>3.2.3.3 Vacancy Rates</u>. A vacancy rate was tabulated for all of the 27 housing units that were found in the sample blocks. About 11 percent (3) of the housing units were determined to be vacant in the sample blocks at the time the survey was taken. A ninety-five percent confidence about the sample proportion for vacancy rate implies that the true proportion would lie between 5 percent and 17 percent.

3.2.3.4 Housing Characteristics. Each household in the sample was asked whether five characteristics existed in the household. The percentage responding positively to each characteristic is shown below in Table 10.

Category	Frequency Number	Distribution Percent	
Cold Running Water	18	90.0%	
Hot Running Water	16	80.0%	
Septic Tank	13	65.0%	
Telephone	14	70.0%	
Electricity	17	85.0%	

Table 10 Housing Characteristics N = 20

Source: (Q22), Frank Orth & Associates, Inc., 1984.

Households were also asked about the type of fuel they use to heat their dwelling. Of the 20 responses received, 75 percent (15) said they relied primarily on wood, 10 percent (2) said they relied primarily on oil, 5 percent (1) said they relied primarily on propane or kerosene, and 10 percent (2) said they relied on other fuel sources. Other fuel sources included some form of electric heat.

3.2.4 Resident Attitudes About Public Facilities and Services

Inhabitants of Trapper Creek were asked to rank their level of satisfaction (which included five options) with available facilities and services. Respondents could also answer with no opinion. In addition, no response was considered as not applicable since many services were not immediately available to respondents. Between 18 and 20 responses were obtained for each of these questions except ambulance which received only four. Results appear in Table 11.

Only 6 of the 13 services included in the survey instrument were locally available to residents of Trapper Creek. These were state trooper protection, schools, ambulance, other medical services besides ambulance, road system, and indoor recreation facilities. Other services such as solid waste disposal, other transportation, mental health services, libraries, fire protection, and social services were not locally available.

The ambulance received the highest percentage of positive responses (100 percent), followed by the road system (95 percent), and schools (83 percent). The highest percentage of neutral and unfavorable responses were received by indoor recreation facilities (28 percent) because of the limited number of facilities. The next service to receive a large number of neutral or unfavorable responses was state trooper protection (25 percent). Unfavorable responses were largely due to perceived lack of protection because of shortages in manpower.

Table 11 Levels of Satisfaction with Selected Public Facilities and Services* N = 20

Facility or Service	Very Satis- fied	Satisfied	Neither Sats: fied nor Dis- satisfied	l- Dissat- - isfied	Very Dis- satisfied	No Opin- ion

* The percentages in this table all add up to 100 percent except for some minor differences due to rounding.

Source: (Q23), Frank Orth & Associates, Inc., 1984.

Respondents were also asked to rank their levels of satisfaction with their water supply and wastewater systems. As shown in Table 12, most respondents were satisfied with their water quality (90 percent) and somewhat less were satisfied with water quantity (85 percent) and their septic tank system (74 percent). The source of the water for 90 percent of Trapper Creek residents was from the ground. Only 10 percent received their drinking water from surface sources.

Table 12

3.2.5 Residency and Settlement Patterns

(13744)

,

Residency and settlement pattern characteristics include seasonality of residents, length of residency, and reasons for choosing to settle in Trapper Creek.

3.2.5.1 Residency and Seasonality. It is important to differentiate between the population of a community at a certain point in time from the number of residents in the community because the State of Alaska distributes certain types of grants to local governments on the basis of the number of people who qualify as residents. The State of Alaska defines a resident as one who lives in a community more than six months of the year or four or more days a week on an annual basis.

Accordingly, questions similar to those in the Mat-Su Borough survey of population and housing were asked of respondents about the amount of time spent in Trapper Creek. Between 9 and 10 percent (6) of the 63 residents in the sample answered that they usually work outside of Trapper Creek in one-week work/one-week home or two-week work/two-week home schedules, and thus would not qualify with the residency requirement of living in Trapper Creek four days a week or more.

The monthly difference in the number of adult inhabitants who live in Trapper Creek throughout the year was identified in the sample results and shown in Table 13. The number of adults living in Trapper Creek in January through April 1983 was equal to only 54 percent of the total number living in the community at the time of the survey.

October November December	31 26	73.8%
November December	26	(1 08)
December		61.9%
T	26	61.9%

Second Quarter	23.0	
Third Ouarter	25.7	
Fourth Quarter	31.7	

Table 13 Seasonality of Adult Residents N = 42

Source: (Q5), Frank Orth & Associates, Inc., 1984.

paran .

> Part of the variation in seasonality of residence can be explained by looking at the location of jobs held by residents. According to the 34 responses received to this question, 12 adults in the sample had jobs that were located in areas outside of the Mat-Su Borough, Anchorage, and Fairbanks.

> Seasonal variations are important factors in explaining the number of year-round residents and in estimating the demand on public facilities and services in the community. The survey data suggest that only 54 percent of the population living in the community in September 1983 were there year-round.

According to the sample results, adult inhabitants of Trapper Creek have spent an average of 4.3 years in the community. Length of residency data show that about 20 percent of the adult inhabitants interviewed in Trapper Creek have lived in the community for less than 2 years, with over 12 percent having moved into the community in the six months prior to the survey. In contrast, 22 percent (9) of all adult inhabitants have lived in Trapper Creek for more than 10 years. Results appear in Table 14.

<u>3.2.5.2</u> Prior Location of Residence. Respondents were asked to state where they lived prior to moving to Trapper Creek and why they chose to move to Trapper Creek. Forty-five percent of residents (9) lived outof-state before moving to Trapper Creek, according to Table 15. The next largest number of in-migrants came from Anchorage (40 percent). Other locations in Alaska excluding Anchorage and the Mat-Su Borough accounted for 15 percent of the in-migrants in Trapper Creek.

Page 27

<u>3.2.5.3 Reasons For Moving</u>. As shown in Table 16, the most frequently cited reasons for moving to Trapper Creek were related to the quality of life (32 percent), the availability of land (21 percent), business reasons (11 percent), and recreation opportunities (11 percent). Other reasons which accounted for over 10 percent of the respondents' answers include health reasons, a desire to live here, and lower population density.

	Frequency 1	Distribution
Category	Number	Percent
To Obtain a Job	1	5.3%
To Set Up a Business	2	10.5%

Other	2	10.5%
		100.1%

Table 16Reasons for Moving to Present Location

Source: (Q18a and b), Frank Orth & Associates, Inc., 1984.

Additional reasons for moving, as shown in Table 17, were also weighted heavily toward the quality of life response (about 38 percent) and the availability of land (about 13 percent). One reason not previously mentioned in the above group of responses included the "inexpensive to live" category (almost 19 percent). Other reasons made up over 18 percent of the responses. Negative attitudes towards urban living and the topography of the Trapper Creek area were cited as reasons for moving under the "other" category.

3.2.6 Fish and Wildlife Resource Use

These questions were asked of households so that questions related to frequency distributions could contain a total of 20 responses. The percentages and calculations in this section should be used with a great deal of caution, as it is highly speculative to base conclusions on fish and wildlife use on data collected for a twelve month period from one point in time.

<u>3.2.6.1</u> Fishing Activity. The average number of people per household who fish was estimated at 1.78 persons per household. Based on an estimated number of 61 occupied households, there are about 109 people in the survey-defined area of Trapper Creek who fish. Eighty percent of the households had at least one person who fishes.

There were a total of 510 person-days spent by the 34 people in the sample who fish, and 28 percent of the days (143) were spent in Area 1 (see Map 1 in Appendix B). Data on the species sought by people who fish in Area 1 were gathered from responses to questions about person-days spent fishing in Area 1 and what species were sought. In the sample, the people who fish in Trapper Creek were most likely to fish for rainbow trout (56 percent), salmon (44 percent) especially silver, and grayling (31 percent), as shown in Table 18. Percentages represent the number of households that fished in Area 1 for a species in the past twelve months, out of the total number of households in the sample who responded that they fish in Area 1.

Category	Number	Percent
Salmon:	7	43.8%
Red or Sockeye	3	18.8%
Pink or Humpy	2	12.5%
Silver or Coho	5	31.3%
Chum or Dog	2	12.5%
King or Chinook	2	12.5%
Grayling	5	31.3%
Rainbow Trout	9	56.3%
Burbot	1	6.3%
Dolly Varden	• 1	6.3%
Whitefish	1	6.3%

Table 18								
Households	That	Fish	in	Area	1	Ъу	Species	Sought
			N =	= 16				

Source: (Q61); Frank Orth & Associates, 1984.

As shown in Table 19, the majority, or about 56 percent, of households that fish responded that their primary reason is sport and recreation. About 38 percent indicated that obtaining food is their main reason. One respondent fished for unspecified reasons. No respondents mentioned fishing for cultural reasons.
	Frequency Distribution

forma

Answers to the question about the percentage of protein supplied from fishing activities give an idea of the extent to which local residents rely on fishing for food. Of the thirteen households responding to the question, about 39 percent said that none of their protein needs were met by fishing and about 62 percent (8) of the households said that up to one quarter of their protein needs during the last year were met by fishing activities. Results appear in Table 20.

Table 20 Fish as a Percent of Annual Protein Needs

	Frequency Distribution		
Category	Number	Percent	
None	5	38.5%	
Less Than One Quarter	8	61.5%	
	13	100.0%	

Source: (Q62), Frank Orth & Associates, Inc., 1984.

A final question about the importance of fishing in Area 1 for recreation was asked of the twenty households. Of the 13 households responding, about 85 percent (11) stated that Area 1 was important or very important to their recreational fishing activities. More than 7 percent of the households answered that Area 1 was not so important for recreation and the same percentage responded that Area 1 was unimportant. <u>3.2.6.2</u> Hunting Activity. Eighty percent of the households contain people that hunt. The average number of people per household who hunt was estimated at 1.35 persons per household. Based on an estimated number of 61 occupied households, there are an estimated 82 people in the survey-defined area of Trapper Creek who hunt.

There were a total of 427 person-days spent by the 27 people in the sample who hunt; 46 percent of the days (196) were spent in Area 1 and none were spent in Area 2 (see Map 2 in Appendix B). Area 1 represents those areas within 10 miles of the Parks Highway and Denali Highway corridors. Area 2 represents the area that would be made more accessible if an access road is built from the Denali Highway to the project site.

The distribution of species sought by people in Trapper Creek who hunt in Area 1 was gathered from responses to questions about person-days spent hunting in Area 1 and Area 2 and what species were sought. In addition, the total harvest by species was also asked of households. Harvest information has been summarized in Table 21 for Area 1.

· · · · · · · · · · · · · · · · · · ·	Species		1983 Harvest Count
	Moose		1
	Blackbear		1
	Ptarmigan		25

		•	

Table 21Harvest Count For Sample Household For Area 1 by Species

Source: (Q72a to 1, Q73a to 1), Frank Orth & Associates, Inc., 1984.

None of the 16 households in the sample that hunt in Area 1 did so for cultural reasons, according to Table 22. Almost 94 percent (15) hunted primarily for food and approximately 6 percent (1) hunted primarily for sport. The latter household only sought moose in Area 1. Only two

Trapper Creek residents had subsistence permits from the Alaska Department of Fish and Game.

Category	Frequency Number	Distribution Percent
Food Sports & Recreation	15 _1_	93.8%
	16	100.1%

Table 22 Main Reason For Hunting

Source: (Q67), Frank Orth & Associates, Inc., 1984.

The answers to the question about the percentage of protein supplied from hunting activities revealed a somewhat moderate reliance upon hunting in the last year to support protein needs. According to Table 23, more than 28 percent (4) of the 14 responding households said that less than onequarter of their protein needs during the last year was met by hunting activities and about 7 percent said that between one-half and three quarters of their protein needs were met by hunting activities in the last year. However, more than 64 percent (9) said that none of their protein needs were met by hunting during the last year. This means that several households which hunted primarily for food, according to Table 22, were unsuccessful in obtaining meat from hunting activities last year.

Table 23

Category	Number	Percent	
None	9	64.3%	
Less Than One Quarter	4	28.6%	
One Half to Three Quarters	1	7.1%	
	14	100.0%	

Source: (Q75), Frank Orth & Associates, Inc., 1984.

A final question about the importance of hunting in Area 1 for recreation was answered by the 12 households that indicated they hunt for sport. One-half of these respondents (representing 30 percent of the overall sample of 20) stated that Areas 1 and 2 were very important to their recreational hunting activities. About 42 percent of the respondents indicated that Areas 1 and 2 were important to their recreational hunting activities. The remaining 8 percent stated that hunting in these areas was not so important to their recreational hunting activities.

<u>3.2.6.3 Trapping Activities</u>. Twenty-five percent of the households in the sample contained people who trap. The average number of people per household who trap was estimated at 0.30 persons per household. Based on an estimated number of 61 occupied households, there may be about 18 people who live in the survey-defined area of Trapper Creek who trap. A ninety-five percent confidence about the sample mean for people per household who trap implies that the true mean would lie between 0.03 people and 0.57 people per household in 95 out of 100 samples of size 20 drawn from the population.

There were a total of 345 person-days spent by the 6 people in the sample who trap. Eighty-six percent of those days (297) were spent in Area 1 and none were spent in Area 2 (see Map 2 in Appendix B).

<u>pesor</u>

The species sought by people in Trapper Creek who trap in Area 1 was gathered from responses to questions about person-days spent trapping in Area 1 and Area 2 and what species were sought. In addition, the total harvest by species was also asked of households. Harvest information has been summarized in Table 24.

Species	1983 Harvest Count

Forty percent of the five households (2) that responded to questions about the main reason for trapping stated that income was the primary reason for trapping. Twenty percent stated that recreation was the main reason according to Table 25. The remaining two households gave a combination of reasons including income and personal use.

Table 25 Main Reason For Trapping

Table 26 Trapping as a Percent of Yearly Income

_ Source: (Q87), Frank Orth & Associates, Inc., 1984.

A final question about the importance of trapping in Areas 1 and 2 for recreation was asked of the 20 households. Of the 5 households responding, eighty percent (4) stated that Areas 1 and 2 were very important or important to their recreational trapping activities. The other household stated that these areas were unimportant to its recreation needs.

3.2.7 Community Change

Households were asked if they had noticed any changes in their community since 1980. Almost 95 percent (18) of the 19 respondent households answered in the affirmative and five percent noticed no changes at all. The most noticeable change in Trapper Creek was the large increase in population. Related changes that were commonly mentioned include: 1) increase in the number of business activities; 2) increase in new construction; and 3) increase in business sales. Other types of changes that were noticed include: 1) the presence of a new school facility; 2) an increase in the number of hunters; 3) the loss of wildlife in the area; 4) differences in the type of people that are moving in as compared to long-time residents; and 5) an upgrade in the road system.

and I am conducting a survey for the Alaska Power Authority (SHOW IDENTIFICATION). We would like you to participate in this survey. Your answers will be completely confidential mand voluntary, and will be greatly appreciated.

This study is part of the Susitna Hydroelectric Project. Its purpose is to provide current information on the ______ area that can be used for project planning.

The questions are about housing, characteristics of the people in your whousehold, hunting and fishing that you do, and recent changes in your community. IF THEY REQUEST MORE INFORMATION, SHOW SUSITNA BROCHURE OR APA LETTER.

I need to speak with someone 18 years or older that <u>lives</u> here. Would that be you?

"The first set of questions will focus on the size of your household and the length of time that you have lived here.

Are you the head of this household?

I. YES

Q-1

2. NO

3. NO HEAD OF HOUSEHOLD

How many adults (age 18 or older) live in this household? IF THIS IS NOT CLEAR, SAY: I mean, all adults who consider this their permanent residence, including people that are not related to you.

FOR A CHILD THAT STAYS PART-TIME, RECORD AS A FRACTION IN QUESTIONS 2b-2d

Q-2b How many children under 5 years of age live in this household?

MAKE SURE THAT THE RESPONDENT INCLUDED INFANTS.

Q-2c How many children ages 5 through 11 live in this household?

Q-2d How many children ages 12 through 17 live in this household?

Q-3a	Are there any ho	ousehold members ti	hat live here all	year round, but		
	usually stay her	e less than four o	Jays per week?

APPENDIX C

SUSITNA HYDROELECTRIC PROJECT SURVEYS IN CANTWELL, TRAPPER CREEK AND TALKEETNA

INFORMATION FOR INTERVIEWERS

I. INTRODUCTION

A. Types of Surveys

There are three types of surveys that will be conducted in the communities:

- 1. Household survey 30\$ of the community's households
- Business survey 100\$ of the identifiable^b business establishments; in addition, business surveys should be conducted when home businesses are identified in the household survey.
- 3. <u>Construction Worker Survey</u> (in Talkeetna and Cantwell only) This survey will be self-administered and will be distributed by the project managers. Completed questionnaires will be mailed to us.

As delineated in our maps of the community.

^b From telephone directories, 1983 for Talkeetna, Trapper Creek, and Cantwell.

B. Survey materials:

- 1. The list of blocks of housing units that will be contacted and additional blocks that may be needed; the list includes the number of housing units that are expected to be in each block and the total target number of households that you should try to interview in that community.
- 2. A preliminary listing of businesses.
- 3. Maps which show where the blocks are, in relation to roads and other identifiable landmarks.
- 4. A set of questionnaires.
- 5. A set of answer lists and 2 fish and game maps which will be used to support the administration of the survey. (from Harza-Ebasco)
- 6. A log to record housing units contacted.
- 7. Waterproof (e.g. clear plastic with zip-lock) container for several surveys
- 8. Compass (hand-held)
- 9. Flashlight

1

- 10. 10 card, from the Alaska Power Authority (from APA)
- 11. A set of George Gleason's business cards (from APA)
- 12. Fact sheet on the project (from APA)
- 13. A copy of the latest newsletter on the project (from APA)

14. Call back sheets, to be placed at households where no one is home

15. Red pens

16. Time and expense sheets
11. HOUSEHOLD SURVEY

A. Background on the methodology:

Possible households were identified from the Mat-Su Borough's assessor records of housing units. These were clustered into areas called blocks. A random sampling method was used to choose the blocks that will be surveyed. Each household in a chosen block should be surveyed. This methodology was chosen in order to limit the amount of travel time needed to conduct the surveys.

Because of the methodology used, a number of issues may come up in trying to locate households:

- i. Some units may be vacant.
- 2. We do not have the names of the residents we are trying to reach.
- 3. In some areas where roads are scarce, the map will not be specific as to where the housing unit is. This will be of most consequence in the Trapper Creek survey.
- 4. The assessor records may be outdated, and additional housing units may be found in some blocks.

B. Operational procedures:

- 1. Attempt to survey the blocks in the order listed.
- 2. Conduct the interviews between 9 a.m. and 9 p.m. If it appears that the time is inconvenient for the respondent, set an appointment for a better time. Be on time for appointments.
- 3. In areas designated as parcel "Al6" or "B4", etc., the location of the "X" on the map is not meant to indicate the location within the parcel the housing unit is. It is not possible to determine the location with the data available to us.
- 4. If there is no one present at a possible residence, try at least 2 callbacks. Callbacks should be done at different times of the day, in order to maximize the possibility of finding the residents at home. If you are able to interview a neighbor of a housing unit that has no one at home, ask the neighbor about the unit (is it occupied; if so, what is a good time to catch the residents at home):
- 5. Do not spend more than 30 minutes trying to locate a housing unit.
- 6. Some areas of the Mat-Su Borough have a high incidence of no-trespass signs at driveways and private roads. If you run across one, try to go on in to see someone. However, if you run into any signs of hostility, leave immediately.
- 7. A housing unit will be considered successfully canvassed if:
 - I. An Interview occurs.
 - 2. The unit is identified as vacant by a neighbor.
 - 3. The interviewer has attempted to call on the housing unit three times, at different times of day, and has not been able to find someone at home.

A housing unit will be considered not successfully canvassed if:

- 1. The household refused to respond.
- The housing unit can not be located.
- 3. It is impossible to gain access, due to barriers, dogs, etc.
- 8. The listing of blocks contains information on the target number of housing units to be canvassed. If you are unable to meet the target number of households, either because of households that refuse to respond or because the housing unit can not be located, there is a secondary listing of blocks that should be used. As always, interview every household in each secondary block that it is necessary to canvass.
- 9. If more housing is found in a block than was expected, go ahead and interview those additional units. This is especially likely to happen in Cantwell. Do not count such households as part of the listing of successfully canvassed housing units. These households will be in addition to the original target survey households.

10. Try to park your car as close to the housing unit as possible.

(PER)

 The questionnaires have been designed to allow open-ended questions to be preceded, as the interviewer is taking down the response. Also, there are instructions on several pages for the interviewer.

In order to help the interviewer distinguish quickly between text that should be spoken aloud and instructions which are only there for the interviewer's purposes, a convention in the typing of the questionnaire has been used:

- All questions and sentences which should be said to the respondent are typed in lower-case letters.
- 2. All words which are not to be spoken aloud (instructions and precoded answers) are typed in upper-case letters.
- 12. In the course of doing some of the surveys, the interviewer may become aware that a member of the household owns a business (question Q-50).

If this is the case, you should explain to the respondent that we are doing two types of surveys, and that you would like to ask a few more questions after the household survey is complete. Upon completion of the household survey, take out a copy of the business questionnaire and run through it.

13. Read the questions exactly as written on the questionnaire. If the respondent does not understand the question, repeat it. It is permitted to elaborate on the meaning of the question, if that appears to be necessary (this is because we are a small group, and we will have gone over the purpose of each question in detail).

Keep a record of any questions that appear to be unclear to the respondent.

14. Some of the questions ask for pretty detailed information and may be construed as an invasion of privacy by some respondents. If a respondent seems rejuctant to answer a question, reiterate that the questionnaires will be kept completely confidential, and that only the aggregated results will be made public. If the respondent refuses to answer the question, indicate this with an R in the answer slot, and go on to the next question. We do not want to encourage people to skip questions, but it is more important to complete the interview than to press for the answer to any particuiar question.

After the respondent has answered the last question, ask him if he will answer the unanswered question(s).

- 15. There are a couple of questions that should be coded by the interviewer, after leaving the house (including Q-31, Q-33, Q-34). Check over the questionnaires each evening for accuracy, legibility, clarity of the wording on the free-answer questions, and to identify/eliminate any conflicting answers.
- 15. In the case of conflicting answers that you identify later, make a note of the original responses and then correct the coded portion of the guestionnaire as appropriate.

C. Filling in the Questionnaire

8.3.R.

*(19*77)

- 1. If there are a <u>list of choices</u> on the questionnaire, choose the one that best fits the respondent's answer and write the number of the question in the answer slot. If the answer does not fit into one of the categories, code the answer as Other, and write down the exact answer.
- 2. If the question <u>asks for a number</u> of years, people, etc., be sure to put a number in the answer slot. Thus, if the respondent answers " a couple of years", confirm that he means 2.
- 3. There are a few questions that are answered by putting check marks in the answer slots (Q:5-16, Q:38-49, 61, 72, and 83).
- 4. For any other questions, write down exactly what the respondent says, and add interviewer notes to clarify, where necessary.
- 5. If a respondent refuses to answer a question, write an R in the answer slot.

D. Guldelines to Questions that Respondents May Ask

- 1. How will this information be used?
 - For project planning

6073)

KCOMED

pietica,

98774

- This is an opportunity for you and other residents to provide input to the planning process.
- Try and move back to the survey questions.
- 2. How long have you lived in Alaska?
 - Stress that you've worked in Alaska a lot/ a long time/ many times.
 - Trained to work on the surveys
- 3. Why do you keep studying this?
 - It is a big and expensive project, important, deserves a lot of consideration.
- 6. How often will you be doing this survey?
 - Once a year.
 - If concern is shown: This is to provide continual input to project planning.
 - We are only surveying about one-third of the households, using a random sample. Your household may or may not be part of the sample next year.
- 7. Skepticism about the APA running roughshod over communities.
 - The purpose of the surveys and the socioeconomic program is to make sure the communities closest to the project are taken into account.

E. Guidelines on selected survey questions

intro Display your Alaska Power Authority iD card at each household.

Present the full explanation of the survey to each respondent (client's request). There may be a number of respondents that are hesitant about participating, or that just refuse. Be as persuasive as possible, focusing specifically on the usefulness of the data to project planning (and the mitigation of impacts to the community).

If the respondent asks for more information on the project, explain a little and give him/her a fact sheet.

if the respondent asks to receive a copy of the results, explain that the APA has not determined distribution policy, and take down his/her name and address.

If the respondent asks questions about the project that are outside our scope of work, give him/her George Gleason's card, and explain that he will best be able to answer their questions.

If an adult that lives there is not available, try to determine, from the child or non-resident you are speaking with, a likely time to reschedule the interview.

- <u>Q-1</u> Head of household * primary wage earner. If more than one person makes the same amount of money, they are both heads of household.
 - <u>Q-2a</u> The answer should include people that are away at the hospital or on a trip.
 - <u>Q-2b-2d</u> Many people forget to identify new-born infants as members of the household because they aren't used to thinking of them as individuals yet. That is why there is an indication to the interviewer that this should be checked.

Age is determined by the person's last birthday. So, if someone is going to be 5 years old tomorrow, they should be listed as under 5 years.

Children who live in the resident on a part-time basis should be included as a fraction.

- Q:5-16 Be sure to confirm that the respondent understands the question was asked in the negative. Place check marks next to the months they mention
- <u>Q-17</u> Write down the respondent's exact answer, and then fill in the coded answer.

Q-20 Trailer = unit on wheels; Mobile home = unit on blocks

Q:23-24 if the respondent answers that he/she considers the facility and service in question poor or very poor, ask what his/her reasons are.

> Review the listing of facilities/services that are available in the community or for the community, and eliminate any sub-questions that are not relevant.

<u>Q-30</u> Employment is considered to be an activity for which the respondent gains income. Working at their own business is employment. Building one's own house is not considered employment.

The answer is 2, Unemployed and actively seeking work, if the person has sought work during the past month.

- Q-31 Write down the respondent's exact answer, and then fill in the coded answer.
- <u>Q-33</u> Write down the respondent's exact answer, and then fill in the coded answer.
- Q-34 Write down the respondent's exact answer, and then fill in the coded answer.
- <u>Q-35</u> If you are unsure if the community the respondent mentions is within 10 miles of their home, ask him/her.
- <u>Q-50</u> if the answer is YES (i), make a note to do a business survey after the household survey is completed.

Q-65, A cultural activity is an activity you traditionally do with Q-78, family or friends, that you do on a regular basis, and that is Q-87 related to your way of life.

- <u>Q-90</u> If the respondent has not lived in the community since 1980, ask him/her to talk about any changes since moving there.
- <u>Q-91</u> As the respondent mentions changes, note the type of change in the left-hand column. Then, ask the respondent to rate the magnitude of the change and place the code in the second column.

III. BUSINESS SURVEY

A. Methodology

All businesses in each community should be interviewed. Each interviewer will start out with a listing of known businesses in the community. During the first couple of days, you should ask members of the community to identify any other businesses that there are.

in addition there will be some businesses that will be identified from the household surveys. These businesses should also be surveyed.

B. Procedures

- I. Conduct the interviews between 9 a.m. and 9 p.m.
- 2. Ask to speak with the owner or manager. If that person is not there, determine a better time to reach him or her.

If the respondent is the manager and cannot answer all questions, obtain the owner's phone number. We will contact the owner at a later time.

- 3. Some respondents may operate more than one business. If this is the case, a questionnaire should be filled out on each business.
- 4. The questionnaires have been designed to allow open-ended questions to be precoded, as the interviewer is taking down the response. Also, there are instructions on several pages for the interviewer.

In order to help the interviewer distinguish quickly between text that should be spoken aloud and instructions which are only there for the interviewer's purposes, a convention in the typing of the questionnaire has been used:

- 1. All questions and sentences which should be said to the respondent are typed in lower-case letters.
- 2. All words which are not to be spoken aloud (instructions and precoded answers) are typed in upper-case letters.
- 5. Read the questions exactly as written on the questionnaire. if the respondent does not understand the question, repeat it. <u>it is per-</u><u>mitted</u> to elaborate on the meaning of the question, if that appears to be necessary (this is because we are a small group, and we will have gone over the purpose of each question in detail).

Keep a record of any questions that appear to be unclear to the respondent.

6. Some of the questions ask for pretty detailed information and may be construed as an invasion of privacy by some respondents. If a respondent seems reluctant to answer a question, reiterate that the questionnaires will be kept completely confidential, and that only the aggregated results will be made public. If the respondent refuses to answer the question, indicate this with an R in the answer slot, and go on to the next question. We do not want to encourage people to skip questions, but it is more important to complete the interview than to press for the answer to any particular question.

After the respondent has answered the last question, ask him if he will answer the unanswered question(s).

7. Check over the questionnaires each evening for accuracy, legibility, clarity of the wording on the free-answer questions, and to identify/eliminate any conflicting answers.

C. Filling In the Questionnaire

- I. If there are a <u>list of choices</u> on the questionnaire, choose the one that best fits the respondent's answer and write the number of the question in the answer slot. If the answer does not fit into one of the categories, code the answer as Other, and write down the exact answer.
- 2. If the question asks for a number of years, people, etc., be sure to put a number in the answer slot. Thus, if the respondent answers " a couple of years", confirm that he means 2.
- 3. There are a few questions that are answered by putting check marks in the answer slots (Q-22, Q-25, Q-28).
- 4. For any other questions, write down exactly what the respondent says, and add interviewer notes to clarify, where necessary.
- 5. If a respondent refuses to answer a question, write an R in the answer slot.

D. Guidelines on selected questions

- Q-1 Be sure that the respondent is answering the question for only that one business.
- Q-8a Met your needs = been able to provide you with the amount of goods and services that you need.
- Q-9a Expansion of an existing business and the start of a new business may not appear to be distinct actions to the respondent, when this first question is asked. If the respondent begins to talk about starting a new business, record this answer under Q-10. Then, clarify the distinction and ask if the respondent plans on expanding his/her present business as well.

0145h

Talkeetna

Taikeetna is an unincorporated community in the Mat-Su Borough. Incorporated status was voted down in 1982.

- I. Closest state Trooper post is in Trapper Creek.
- 2. School is new and well-equipped. Handles grades K-6.
- 3. Has a fire station and new equipment. Staffed by volunteers.
- 4. Nearby landfill operated by the borough.
- 5. Ambulance and active EMT organization
- 6. No medical care available in the community; Use hospitals in Anchorage, Fairbanks, Palmer. Doctors in Wasiila as well.
- 7. Road System maintenance of state roads by the state, borough roads by the borough.
- 8. Railroad passes through. Airfield. Residents use float planes on nearby lakes.
- 9. Social Services a counselling center available in Palmer; extension services were rejected by the Talkeetna community.
- II. There is a library.
- 12. Indoor Recreation none
- 13. Outdoor Recreation Facilities nearby Denali State Park, McKinley National Park. Talkeetna is historically the take-off point for expeditions to Mt. McKinley, and fishing/hunting parties.
- 14. No water system
- 15. No sewage treatment system

Trapper Creek

Trapper Creek is an unincorporated community in the Mat-Su Borough.

- 1. State Trooper post
- 2. School is new and well-equipped. Handles grades K-6.
- 3. No fire protection. Old building and equipment that is not used or maintained.
- 4. Nearby landfill operated by the borough.
- 5. Ambulance and active EMT organization
- 6. No medical care available in the community; a nurse that lives in the community helps out when she can. Use hospitals in Anchorage, Fairbanks, Palmer. Doctors in Wasilia as well.
- 7. Road System maintenance of state roads by the state, borough roads by the borough.
- 8. No other transportation facilities; residents use float planes on nearby lakes.
- 9. Social Services a counselling center available in Palmer; there is an extension service in Trapper Creek periodically.
- Library was a hot political issue. I believe it was voted down..
 Indoor Recreation none
- 13. Outdoor Recreation Facilities nearby Denall State Park, McKinley National Park.
- 14. No water system
- 15. No sewage treatment system

Cantwell

Cantwell is an unincorporated community in an unorganized borough.

- 1. State Trooper post
- 2. School is new and well-equipped. Handles grades K-12.
- 3. Fire hall under planning/construction
- 4. Garbage dump is on land that is technically private (Native-owned). Obtaining a better landfill is a high-priority need.
- 5. Ambulance would be associated with fire hall
- 6. No medical care available in the community. Use hospitals in Anchorage, Fairbanks,
 - Palmer. There is a small clinic in Healy, doctors in Wasilia as well.
- 7. Road System maintenance of state roads by the state.
- B. There is a private air strip. The Railroad passes through, and a couple of residents use float planes on nearby lakes.
- 9. Social Services only those provided by the state in Anchorage, Fairbanks.
- 11. Library there is a library at the school.

12. Indoor Recreation - the Native community built a community building.

13. Outdoor Recreation Facilities - nearby McKinley National Park.

14. No water system

(factoring

15. No sewage treatment system
